Note

Before using this information and the product it supports, be sure to read the general information under Appendix A, “Notices” on page A-1.

Tenth Edition, December 1999

This is a major revision of GC28-1785-08.

This edition applies to OS/390 Version 2 (5647-A01), OS/390 Version 1 (5645-001), MVS/ESA System Product Version 5 (5655-068 or 5655-069), and to all subsequent releases and modifications until otherwise indicated in new editions.

About This Book

The MVS System Messages books primarily describe messages that are issued to the system operator at the system console and system messages that are logged. These include:

- Operator messages issued by the BCP and DFSMS/MVS.
- Log messages issued by the BCP and DFSMS/MVS.
- Some SYSOUT messages issued by the BCP and DFSMS/MVS. SYSOUT messages are issued by utilities that normally run in batch, such as SPZAP.
- Batch job messages issued by the BCP. Messages issued by JES2 or JES3 for batch jobs are in the JES messages books.

For the most part, messages issued at interactive terminals (like TSO/E and CICS terminals) are documented by the specific elements and products that support those terminals.

The titles of the MVS System Messages books indicate the range of message prefixes in the books:

- *OS/390 MVS System Messages, Vol 1 (ABA-ASA)*, GC28-1784
- *OS/390 MVS System Messages, Vol 2 (ASB-EZM)*, GC28-1785
- *OS/390 MVS System Messages, Vol 3 (GDE-IEB)*, GC28-1786
- *OS/390 MVS System Messages, Vol 4 (IEC-IFD)*, GC28-1787
- *OS/390 MVS System Messages, Vol 5 (IGD-IZP)*, GC28-1788

If you do not know which book describes a particular message, try searching the messages and codes bookshelf. Here are some of the books on that bookshelf:

- The MVS System Messages books
- *OS/390 MVS Dump Output Messages*, GC28-1749
- *OS/390 MVS System Codes*, GC28-1780
- *OS/390 MVS Routing and Descriptor Codes*, GC28-1778
- *OS/390 HCD Messages*, GC28-1849
- *OS/390 JES2 Messages*, GC28-1796
- *OS/390 JES3 Messages*, GC28-1804
- *OS/390 TSO/E Messages*, GC28-1978
- *OS/390 UNIX System Services Messages and Codes*, SC28-1908

For a list of message books sorted by message prefix, see “Message Directory” on page viii.

Who Should Use These MVS System Messages Books

The system messages books are for all people who receive messages from the system. Usually, these people are system operators, system programmers, and application programmers who do any of the following tasks:

- Initialize the operating system and its subsystems
- Monitor system activity
- Keep the system running correctly
- Diagnose and correct system problems
- Diagnose and correct errors in problem programs

© Copyright IBM Corp. 1988, 1999

How to Use These Books

The system messages books contain descriptions of messages, along with the following:

- “Message Library” on page viii tells how to create a customized message library
- “Message Directory” on page viii lists all message prefixes and the books containing the message descriptions
- “Introduction” on page INTRO-1 describes how the system issues messages, where it places them, and their formats

Message Descriptions: Message chapters are arranged alphabetically by the message prefixes. In each chapter, the messages are arranged numerically by the numbers following the prefix. The description for each message:

- Explains why the system issued the message.
- Identifies the component, subsystem, or product issuing the message.
- Describes the actions taken by the system.
- Suggests actions that the operator, user, application programmer, or system programmer can take, if appropriate, in response to the message.

The system programmer responses assume that the programmer has performed the customary diagnosis described in the *OS/390 MVS Diagnosis: Procedures*.

Where to Find the Most Current Message Information

The MVS System Messages books are cumulative. As messages are added to the system they are added to the books. Similarly, when messages are changed on the system, they are changed in the books. However, when a message is deleted from the system (no longer issued), the message is *not* deleted from the book. This means that users can look in the most recent message books for the most current descriptions of system messages.

To find the most current edition of a book, you can look on the Web. Point your browser to the OS/390 home page and click on the Library icon:

`http://www.ibm.com/s390/os390/`

When you are in the OS/390 library area, use the messages and codes database to search for the message ID you are interested in.

Where to Find More Information

Many message descriptions refer to:

- **Data areas and control blocks**: See *OS/390 MVS Data Areas, Vol 1 (ABEP-DALT)*, *OS/390 MVS Data Areas, Vol 2 (DCCB-ITTCTE)*, *OS/390 MVS Data Areas, Vol 3 (IVT-RCWK)*, *OS/390 MVS Data Areas, Vol 4 (RD-SRRA)*, and *OS/390 MVS Data Areas, Vol 5 (SSAG-XTLST)*.
- **Dumps**: For examples of ABEND, stand-alone, and SVC dumps and how to read them, see *OS/390 MVS Diagnosis: Tools and Service Aids*. For examples of component output from dumps LY28=1813 --> and how to read and request it, see *OS/390 MVS Diagnosis: Reference*.
- **Identification of a component, subsystem, or product**: See the *OS/390 MVS Diagnosis: Reference* to identify the component, subsystem, or product from the name of an IBM module or for a macro. The module prefix and macro tables give the program identifier to be used in a PIDS symptom in a search argument.
- **System completion and wait state codes**: See *OS/390 MVS System Codes*.
- **Logrec data set error records**: For the formatted records, see *OS/390 MVS Diagnosis: Reference*.

- **Trace output**: For the formats and the meaning of the information in the generalized trace facility (GTF) trace, instruction address trace, master trace, system trace, and component trace, see *OS/390 MVS Diagnosis: Tools and Service Aids*.

The following tables list books that contain information related to the information contained in the MVS System Messages books. For the titles and order numbers of books not in the tables, see the *OS/390 Information Roadmap*.

Use the appropriate *Principles of Operation* book for the hardware you have installed.

When the MVS System Messages books reference information in other books, the shortened version of the book title is used. The following tables show the complete titles and order numbers of the books that you might need while you are using the MVS System Messages books.

Subsystem, Product, and Hardware Books

Title	Order Number

VM/ESA CP Command and Utility Reference	SC24-5519
VM/ESA General User Command Reference	SC24-5433

Message Library

The message library is designed so that operators and programmers in an installation can build their own libraries of the message and code information that fits their specific needs. Each person can place into binders the chapters and books containing only the messages and codes he or she could receive.

Basic Books

Each installation requires at least one copy of each of the MVS System Messages books and of *OS/390 MVS Dump Output Messages*. Regardless of your specific system's options, you will receive at the console or in listings some subset of the messages in these books.

Each installation also requires at least one copy of *OS/390 MVS System Codes*, which contains the 3-digit hexadecimal system completion codes (abend codes) and the wait state codes produced by all the components of the system.

Note: 4-digit decimal user completion codes appear in books for the component, subsystem, or product that produces the codes. Codes produced by installation-provided programs do not appear in IBM books.

All programming and operations personnel need access to the basic books, although application programmers might not need to have their own copies.

Optional Books

For information about message changes for multiple OS/390 elements including JES2, JES3, RACF, TCP/IP, and others, see *OS/390 Summary of Message Changes*.

An installation's system programmer needs *OS/390 MVS Routing and Descriptor Codes* for the routing and descriptor codes for the messages that have these codes.

CD-ROM Collection

A comprehensive source of messages for IBM products is contained in the *IBM Online Library Productivity Edition: Messages and Codes Collection, SK2T-2068*.

Message Directory

To use a message prefix to locate the book containing a specific message, see the following table.

Prefix	Component	Book Title - Order Number
ABA	DFSMShsm	*OS/390 MVS System Messages, Vol 1 (ABA-ASA)*, GC28-1784
ACP	LANRES	*OS/390 MVS System Messages, Vol 2 (ASB-EZM)*, GC28-1785

Message Translation

Through the MVS message service (MMS), you can translate MVS system messages into other languages. Messages that cannot be translated include the following:

- Initialization messages
- DFSMS/MVS messages
- JES3 messages
- Some complicated multiple-line messages

See *OS/390 MVS Planning: Operations* and *OS/390 MVS Programming: Assembler Services Guide* for information about using the MMS.

Summary of Changes

Summary of Changes
for GC28-1785-09
as Updated December, 1999
online only for SK2T-6700-15

The following changes appear only in the online version of this publication. A vertical bar (|) in the left margin indicates changes to the text and illustrations.

This revision reflects the deletion, addition, or changing of information from service items and maintenance.

Summary of Changes
for GC28-1785-08
OS/390 Version 2 Release 8

This book contains information previously presented in GC28-1785-07, which supports OS/390 Version 2 Release 7.

This book includes terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

Please note that any new, changed, or deleted messages can affect your installation's automation package. Ensure that your installation's automation package is updated with these changes.

The following summarizes the changes to that information.

Summary of Changes
for GC28-1785-07
as Updated June, 1999
online only for SK2T-6700-13

The following changes appear only in the online version of this publication. A vertical bar (|) in the left margin indicates changes to the text and illustrations.

This revision reflects the deletion, addition, or changing of information from service items and maintenance.

Summary of Changes
for GC28-1785-06
OS/390 Version 2 Release 7

This book contains information previously presented in GC28-1785-05, which supports OS/390 Version 2 Release 6.

This book includes terminology, maintenance, and editorial changes.

Please note that any new, changed, or deleted messages can affect your installation's automation package. Ensure that your installation's automation package is updated with these changes.

This revision also reflects the deletion, addition, or modification of information to support miscellaneous maintenance items and the following APARs:

- OW31590
- OW33971
- OW34065
- OW35198
- OW35558

The following summarizes the changes to that information.

Summary of Changes
for GC28-1785-05
OS/390 Version 2 Release 6

This book contains information previously presented in GC28-1785-04, which supports OS/390 Version 2 Release 5.

This book includes terminology, maintenance, and editorial changes.

Please note that any new, changed, or deleted messages can affect your installation's automation package. Ensure that your installation's automation package is updated with these changes.

This revision also reflects the deletion, addition, or modification of information to support miscellaneous maintenance items and the following APARs:

- OW31129

The following summarizes the changes to that information.

New Information

The following are the new message identifiers for this major revision:

- ATB229
- AVM011
- ERB113
- ERB114
- ERB490

Summary of Changes
for GC28-1785-03
as Updated December, 1997
online only for SK2T-6700-07

The following changes appear only in the online version of this publication.

This revision also reflects the deletion, addition, or modification of information to support miscellaneous maintenance items and the following APARs:

- OW28797
- OW28803

Summary of Changes
for GC28-1785-03
OS/390 Version 2 Release 4

This book contains information previously presented in GC28-1785-02, which supports OS/390 Version 1 Release 3.

This book includes terminology, maintenance, and editorial changes.

Please note that any new, changed, or deleted messages can affect your installation's automation package. Ensure that your installation's automation package is updated with these changes.

Summary of Changes
for GC28-1785-01
OS/390 Version 1 Release 2

This book contains information previously presented in GC28-1785-00, which supports OS/390 Version 1 Release 1.

This book includes terminology, maintenance, and editorial changes.

Please note that any new, changed, or deleted messages can affect your installation's automation package. Ensure that your installation's automation package is updated with these changes.

Summary of Changes
for GC28-1785-00
OS/390 Version 1 Release 1

This book contains information previously presented in *MVS/ESA System Messages, Volume 2 (ASB-ERB)* GC28-1481, which supports MVS/ESA System Product Version 5.

Please note that any new, changed, or deleted messages can affect your installation's automation package. Ensure that your installation's automation package is updated with these changes.

This revision reflects the deletion, addition, or changing of information to support the following APARs:

- OW09908
- OW15791
- OW16456
- OW17807

New Information

The following are the new message identifiers for this major revision:

- EDG2222E

Changed and Deleted Information

The following are the changed message identifiers for this major revision:

- ATB103I
- ATB400I
- CSV411I
- EDG2103D
- EDG2104E
- EDG2105E
- EDG2106D
- EDG6607D
- EDG6609D
- EDG6627A
- EDG6627D

Introduction

The OS/390 operating system issues messages from OS/390 elements and features, and from program products and application programs running on the system. The system issues messages in different ways and to different locations:

- Most messages are issued through WTO and WTOR macros to one of the following locations:
  - Console
  - Hard-copy log
  - Job log
  - SYSOUT data set

  Routing codes determine where the messages are displayed or printed. The routing codes for messages issued by the operating system are in the *OS/390 MVS Routing and Descriptor Codes* book.
- Other messages are issued through the WTL macro or the LOG operator command to the system log (SYSLOG).
- Dump messages are issued through the dumping services routines and can appear in:
  - SVC dumps, stand-alone dumps, or SYSMDUMP ABEND dumps formatted by the interactive problem control system (IPCS)
  - Trace data sets formatted by the interactive problem control system (IPCS)
  - ABEND dumps or SNAP dumps produced by the dumping services

  In dump or trace data sets formatted by IPCS, the messages appear interactively on a terminal or in a printed dump.
- Some messages are issued through DFSMS/MVS access methods directly to one of the following locations:
  - Output data set
  - Display terminal

Locations

Console

Messages sent to a multiple console support (MCS) console or an extended MCS console are intended for the operators. Operations can control which messages are displayed. See the *OS/390 MVS Planning: Operations* book for information about controlling message display.

The system writes in the hard-copy log all messages sent to a console, whether the message is displayed or not.

Hard-Copy Log

A record of all system message traffic, which consists of the following:

- Messages to and from all consoles
- Commands and replies entered by the operator

In a dump, these messages appear in the master trace. For information about the master trace, see *OS/390 MVS Diagnosis: Tools and Service Aids*.

With JES3, the hard-copy log is always written to the system log. With JES2, the hard-copy log is usually written to the system log, but an installation can specify that the system write the hard-copy log to a console printer.

© Copyright IBM Corp. 1988, 1999

System Log

The system log (SYSLOG) is a SYSOUT data set provided by the job entry subsystem (either JES2 or JES3). SYSOUT data sets are output spool data sets on direct access storage devices (DASD). An installation usually prints the system log periodically. The system log consists of:

- All messages issued through WTL macros
- All messages entered by operator LOG commands
- Usually, the hard-copy log
- Any messages routed to the system log from any system component or program

Job Log

Messages sent to the job log are intended for the programmer who submitted a job. The job log is specified in the system output class on the MSGCLASS parameter of the JCL JOB statement.

SYSOUT Data Set

Messages sent to a SYSOUT data set are intended for a programmer. These messages are issued by an assembler or compiler, the linkage editor and loader, and an application program. If the SYSOUT data set and the MSGCLASS parameter on the JCL JOB statement specify the same class, all messages about a program will appear in the same SYSOUT listing.

Messages

A displayed or printed message can appear by itself or with other information, such as a time stamp. The following topic shows the format of the message. Then the topics show the information accompanying the message on the MCS console and on the hard-copy log in a JES2 system and a JES3 system.

Message Format

```
id CCCnnn text
id CCCnnns text
id CCCnnnns text
id CCCnnnnns text
id CCCSnnns text
```

id Reply identifier: It is optional. It appears if an operator reply is required. The operator specifies it in the reply.

CCCnnn, CCCnnns, CCCnnnns, CCCnnnnns, CCCSnnns
Message identifier.

CCC
A prefix to identify the component, subsystem, or product that produced the message. The prefix is three characters.

S The subcomponent identifier, which is an optional addition to the prefix to identify the subcomponent that produced the message. The subcomponent identifier is one character.

nnn, nnnn, nnnnn
A serial number to identify the individual message. The serial number is three, four, or five decimal digits.

s An optional type code, which is one of the following:

A **Action**: The operator must perform a specific action.

D **Decision**: The operator must choose an alternative.

E **Eventual action**: The operator must perform action when time is available.

I **Information**: No operator action is required. Most information messages are for a programmer.

S **Severe error**: Severe error messages are for a programmer.

W **Wait**: Processing stops until the operator performs a required action.

For messages with the prefix ADR, the type codes depend on whether the message is issued to the operator console or to SYSPRINT. For console messages, the type codes indicate the operator action:

A Action: Operator must perform a specific action.

D Decision: Operator must choose an alternative action.

I Information: No operator action is required.

W Attention: No operator action is required, but an error occurred.

For SYSPRINT messages, the type code indicates the severity:

I Informational message.

W Attention message. Task continues, but an error occurred.

E Error message. The particular task might end or might continue without completing all requests.

T Termination message. DFSMSdss ends.

For messages with the prefix BFS, the type codes indicate the severity of the detected error and are:

E **Error**. Operator action is required.

I **Information**

W **Attention**

For messages with the EWX prefix, an 11-character message exists of the form **EWXfffnnnns**:

EWX LANRES product code

fff Function (module) identifier

nnnn Message number

s Severity code. Severity codes can be:

- **E** Error. Action is required.
- **I** Information. Action is not required.
- **S** Severe Error. Action is required.
- **W** Attention. Action may be required.

In the EWX messages, the three-character function identifiers are as follows:

Table 1. EWX Message Module Identifiers

Module ID	Function	Sending Command
ADM	Administration	EWXADMIN commands
COM	Host communications	All commands
DSK	Disk serving	Disk serving commands
DST	Distribution	EWXDS commands
PHL	Host-to-LAN print	EWXHLSRV
PLH	LAN-to-host print	EWXLHSRV
RES	Host session initialization	EWXCONN
SRV	NetWare service	EWXNWSRV

Note: When the term “MMC” is used in the messages, it is also referring to the System/370 Parallel Channel Adapter feature of the IBM 3172-3 interconnect controller.

For messages with the prefix CNLC, the type codes indicate the severity of the detected error and are:

E **Error**

I **Information**

S **Severe**

W **Attention**

For messages with the prefix IEW and message numbers in the range 2000 through 2999, the type codes indicate the severity of the detected error and are:

E **Error**: Severity 8

I **Information**: Severity 0

S **Severe error**: Severity 12

T **Terminating error**: Severity 16

W **Attention**: Severity 4

For messages with the prefix IGW01, the type codes indicate the severity of the detected error and are:

E **Error**: Return code 8

I **Information**: Return code 0

S **Severe**: Return code 16

T **Ending**: Return code 12

W **Attention**: Return code 4

text

Text: The text provides information, describes an error, or requests an operator action.

Messages with the prefix IDA are preceded by a 2-digit severity code:

04 **Attention**: Processing may be successful.

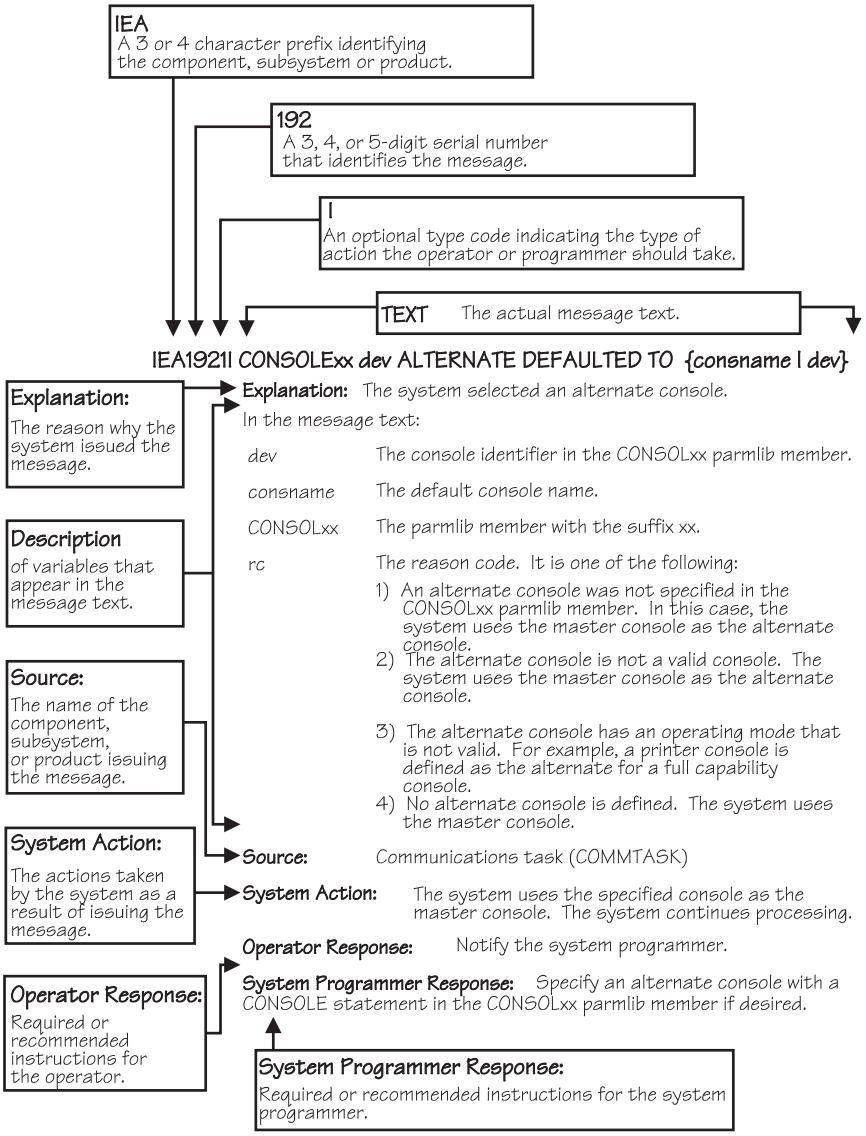
08 **Error**: Processing may fail.

12 **Serious error**: Processing will probably fail.

Some messages have asterisks (*) before or after the message identifier. Two asterisks after the message identifier for IDC messages indicates a second-level message that further explains a preceding message.

Message Explanation Format

The following figure shows how message explanations appear in this book:



Messages Sent to MCS Consoles

Messages sent to MCS consoles from the base control program, JES2, JES3 on local processors, or DFP appear in one of the following formats:

- The MFORM parameter in the OPERPARM segment in the CONSOLxx parmlib member
- The MFORM parameter on the CONTROL S operator command.

```
hh.mm.ss sysname jobname message
hh.mm.ss sysname message
hh.mm.ss jobname message
hh.mm.ss message
sysname jobname message
sysname message
jobname message
message
```

Messages sent to JES3 consoles (attached to JES3 global processors only) appear in the format:

```
hhmmsst i f jobname text
```

hh.mm.ss
hhmmsst
Time stamp: the hour (00-23), minute (00-59), second (00-59), and, for JES3, tenth of a second (0-9).

sysname
System name for the system that issued the message.

jobname
Job name for the task that issued the message. This field is blank if a job did not issue the message.

i Indicator from the JES3 spool access method (JSAM).

f A screen character to indicate the status of certain messages, as follows:

| The operator has performed the action required for the message. The message has been deleted.

- The message is for information only; no operator action is required. The message was issued by the system or by a problem program.

***** The message requires specific operator action and was issued by a WTOR or by an authorized program. The message has a descriptor code of 1, 2, or 11.

@ The message requires specific operator action and was issued by a WTOR or by a problem program. The message has a descriptor code of 1, 2, or 11.

+ The message requires no specific operator action and was issued by a problem program using a WTO macro.

blank The message requires no specific operator action.

Note: See the *OS/390 MVS Routing and Descriptor Codes* book for the descriptor codes.

message
Reply identifier, message identifier, and text.

Messages Sent to Hard-Copy Log in JES2 System

Multiple console support (MCS) handles message processing in:

- A JES2 system
- A JES3 system on a local processor
- A JES3 system on a global processor, if JES3 has failed

MCS sends messages with routing codes 1, 2, 3, 4, 7, 8, and 10 to the hard-copy log when display consoles are used or more than one console is active. All other messages can be routed to the hard-copy log by a system option or a VARY HARDCPY operator command.

Messages sent to the hard-copy log appear in the format:

```
tcrrrrrrr sysname yyddd hh:mm:ss.th ident msgflags  message
t                                                   message
t                                lid                message
```

t The first character on the line indicates the record type:

- **D** Data line of a multiple-line message; this line may be the last line of the message.
- **E** End line or data-end line of a multiple-line message.
- **L** Label line of a multiple-line message.
- **M** First line of a multiple-line message.
- **N** Single-line message that does not require a reply.
- **O** Operator LOG command.
- **S** Continuation of a single-line message or the first line of a multi-line message. This continuation may be required because of the record length for the output device.
- **W** A multi-line message that requires a reply and sent only to the hard-copy log.
- **X** A log entry that did not originate with a LOG command or a system message.

Note: This field does not appear when the hard-copy log is printed on a console in a JES2 system.

c The second character on the line indicates whether the line was generated because of a command:

- **C** Command input.
- **R** Command response.
- **I** Command issued internally. The job identifier contains the name of the internal issuer.
- **blank** Neither command input nor command response.

Note: This field does not appear when the hard-copy log is printed on a console in a JES2 system.

rrrrrrr

Hexadecimal representation of the routing codes 1 through 28. To understand this hexadecimal number, convert it to binary; each binary 1 represents a routing code. For example, X'420C' represents routing codes 2, 7, 13, and 14 as shown here:

```
Hexadecimal:      4         2          0            C
Binary:       0 1 0 0   0 0 1 0    0  0  0  0    1  1  0  0
Routing Codes: 1 2 3 4   5 6 7 8    9 10 11 12   13 14 15 16
```

sysname

The system name from the SYSNAME parameter in the IEASYSxx parmlib member.

yyddd
The Julian date, given as the year (00-99) and the day of the year (000-366).

Note: If HCFORMAT(CENTURY) is specified in the CONSOLxx parmlib member, the Julian date appears as *yyyyddd*.

hh:mm:ss.th
Time stamp, given as the hour (00-23), minute (00-59), second (00-59), and hundredths of a second (00-99).

ident
The job identifier for the task that issued the message, if the second character on the line is blank.

If the second character on the line is C or R, this field contains one of the following:

jobid	The job identifier of the task that issued the message, if it was issued by a job.
consname	Console name of the console which issued the command or received the message.
INTERNAL	For a command generated by a problem program or the system.
INSTREAM	For a command read from the input stream.
blank	If MCS could not determine the source or destination for the message.

lid Multiple-line identifier for the second and succeeding lines of a multiple-line message. This field appears after the message text (1) on the first line or (2) in the message area and not followed by text on a continuation of the first line. The identifier appears on all lines of the same message.

msgflags
Installation exit and message suppression flags. For mapping of these flags, see WQEXMOD in *OS/390 MVS Data Areas, Vol 5 (SSAG-XTLST)*. For information about the description of the hardcopy log message flags, see HCL in *OS/390 MVS Data Areas, Vol 2 (DCCB-ITTCTE)*.

message
Reply identifier, message identifier, and text. The reply identifier and message identifier appear only on the first line of a multiple-line message.

Messages Sent to Hard-Copy Log in JES3 System

Messages sent to the JESMSG hard-copy log in a JES3 system appear in the format:

```
hh:mm:sst message
```

Messages sent to the MLOG/DLOG hard-copy log in a JES3 system appear as follows:

```
MLG           90131 1734486  SY1 R= SYSLOG   IEF196I IEF237I JES3 ALLOCATED TO SYSLOG02

```

Messages sent to the MLOG/DLOG hard-copy log appear in the format:

```
dest console  yyddd hhmmsstia[prefix] message
```

dest
JES3 destination class, which corresponds to the MVS routing code.

console
JES3 console name or MVS console identifier, as follows:

blank For a message issued without a console identifier.

nnnnnnnn The JES3 console name (JNAME) from the JES3 initialization stream.

CN(xx) or CN(xxx) The MCS console identifier, where **xx** or **xxx** is the unit control module (UCM) identifier.

INTERNAL For a command generated by a problem program or operating system routine.

INSTREAM For a command read from the input stream.

NETWORK For a message issued to the network job entry (NJE) console.

RMT-NS For a message with a JES3 remote console identifier that is incorrect.

UNKNOWN For a message issued with extended MCS console identifier 255.

NOTFOUND For a message issued with a console identifier for which JES3 could not determine the destination.

yyddd
The Julian date, given as the year (00-99) and the day of the year (000-366).

Note: If HCFORMAT(CENTURY) is specified in the CONSOLxx parmlib member, the Julian date appears as *yyyyddd*.

hhmmsst
Time stamp, given as the hour (00-23), minute (00-59), second (00-59), and tenth of a second (0-9).

i Attention indicator for JES3 space constraints, as follows:

blank Normal output or no action required.

The message is rerouted automatically or by a command from another console.

% Minimum space (track) situation (JSAM).

= Marginal space (track) situation (JSAM).

< Minimum buffer situation (JSAM).

Note: The above four symbols can be changed by a CONSTD statement in the JES3 initialization stream.

a Action prefix character, as follows:

blank Normal message.

+ JES3 input command, issued on the global processor.

- MVS input command, issued on the global processor.

Operator action required.

prefix
sysname R=jobname

Optional prefix for messages issued outside the JES3 address space or on a local processor, as follows:

sysname
The name of the system where the issuing program is running. JES3 determines the name from the ID, RID, or SID parameters on the MAINPROC statement in the JES3 initialization stream.

jobname
The job name of the issuing program. It is all blanks for an system routine.

message
Reply identifier, message identifier, and text.

Messages Sent to the Job Log, to Other Data Sets, and to Display Terminals

Messages sent to the job log, to other data sets, and to display terminals appear in the format designed by the program that issued them.

Truncated Data in Multi-line Messages

When a message is being transported from one system to another in a sysplex, the system might encounter an unexpected error which prevents the entire message text from appearing. This can be caused by any of the following:

- The issuing system is stopped or quiesced.
- The issuing system fails to end a multi-line message.
- The issuing system has a persistent XCF buffer shortage.
- A disruption occurs in sysplex communication.

For any multi-line message, one of the following messages can appear within the message text, indicating such an error:

```
LOSS OF DATA - MESSAGE COMPLETION FORCED
LOSS OF INTERMEDIATE MESSAGE DATA
```

If a program issues a multi-line WTO message but does not end the message by issuing an endline, the target console might stop receiving message traffic. The system will detect this condition and end the message automatically.

To end a multi-line WTO message when it detects that no data line or endline has been issued for the message after an interval of 30 seconds, the system issues the following endline:

```
MESSAGE TIMED OUT - MESSAGE COMPLETION FORCED
```

When this text appears in a multi-line message, perform the action which produced the message again, if necessary. If the text appears again, contact your system programmer, who should then contact the IBM Support Center.

When 100% WTO buffer utilization has been reached, as indicated in message IEA404A, a limit is imposed on the number of lines allowed in multi-line WTO messages. When the line limit is reached for multi-line WTO messages, the following is appended onto the multi-line message:

- MESSAGE TRUNCATED DURING WQE BUFFER SHORTAGE

A Method for Finding Changes to MVS and TSO/E Message Texts

Automation routines are sensitive to changes to message text between releases. You can find changes to message texts in the following ways:

- The Summary of Changes of the related messages book can be helpful when you go from one release to the next.
- Data set SYS1.MSGENU contains data that can help you identify changes to message texts more accurately. This method allows you to find message text changes between your current release and whatever release you choose to migrate to. This method is described below.

Using SYS1.MSGENU to Find Message Text Changes

IBM supplies a data set containing the text of system messages that are translated. This data set, called SYS1.MSGENU, contains the text of system messages in the form of message skeletons. (For more information, see *OS/390 MVS Planning: Operations*.)

Note that this method will not show changes to:

- MVS system messages that are not translated, such as IPL and NIP messages (which are issued before the MVS message service is available)
- Other product messages that are not translated, such as DFSMS/MVS messages, and JES3 messages.
- For JES2 messages, use the appropriate SYS1.VnRnMn.SHASMENU data set.

Also, this method works better if the “old” copy of SYS1.VnRnMn.SHASMENU has the same level of service as the system from which you are migrating.

Once you have installed the OS/390 Release 4 or higher level of the data set you are comparing, you can compare the new data set with the data set on the system from which you are migrating. Depending on how you do the comparison, you can get output like the following.

For new messages, the output might show an I (for Insert) on the left:

```
I - IEA403I     VALUE OF RMAX HAS BEEN CHANGED TO 99
```

For messages whose text has changed, the output might show both an I and a D, indicating that a record in the message file has been replaced:

```
I - IEE162I 46  &NNN. ROLL &A. MESSAGES (DEL=R OR RD)
D - IEE162I 46  &NNN. ROLL &A. MESSAGES (DEL=R, RD)
```

This means that, in message IEE162I, `(DEL=R, RD)` was replaced by `(DEL=R OR RD)`.

Using this information, you can decide if your automation routines need to be changed.

ASB Messages

ASB002I CLASS *clasname* CANNOT BE ADDED.

Explanation: The system cannot add an APPC/MVS transaction scheduler class to the current parmlib configuration because an error occurred while processing an ASCHPM*xx* parmlib member.

In the message text:

clasname The APPC/MVS transaction scheduler class.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCHAD

System Action: The system rejects any requests from transaction programs (TP) that run under the APPC/MVS transaction scheduler class.

Operator Response: Notify the system programmer.

System Programmer Response: Check the lines in the parmlib member for syntax errors. Correct the error(s).

ASB004I CLASS *clasname* DOES NOT EXIST. IT CANNOT BE DELETED.

Explanation: The system cannot delete an APPC/MVS transaction scheduler class because the class was never added to the current parmlib configuration.

In the message text:

clasname The APPC/MVS transaction scheduler class.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCHAD

System Action: The system continues processing.

System Programmer Response: Check the ASCHPM*xx* parmlib member for the correct class name. Enter the correct class name.

ASB006I DEFAULT CLASS *clasname* DOES NOT EXIST. NO DEFAULT CLASS IS DEFINED.

Explanation: The default APPC/MVS transaction scheduler class does not exist in the current parmlib configuration.

In the message text:

clasname The default APPC/MVS transaction scheduler class.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCHAD

System Action: The system does not define a default scheduler class. The system continues processing.

System Programmer Response: Specify a default class on the OPTIONS keyword in the current parmlib configuration.

ASB008I DEFAULT CLASS *clasname* WAS DELETED. NO DEFAULT CLASS IS DEFINED.

Explanation: The default APPC/MVS transaction scheduler class was deleted by a SET command. No default class is defined to the system.

In the message text:

clasname The default APPC/MVS transaction scheduler class.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCHAD

System Action: The system continues processing. The system rejects transaction programs (TP) that do not have a specific class.

System Programmer Response: Specify a default class on the OPTIONS keyword in the current parmlib configuration.

ASB010I THE SUBSYSTEM *subsystm* EXISTS BUT IT IS NOT ACTIVE.

Explanation: When the system tried to start a transaction initiator, the system found that the subsystem specified on the SUBSYS keyword in the current parmlib configuration, but is not currently active. The subsystem must be active in order to start an initiator.

In the message text:

subsystm The subsystem specified on the SUBSYS keyword in the current parmlib configuration.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCHVS

System Action: The system stops processing until one of the following occurs:

- The subsystem is activated
- The SUBSYS keyword is changed

Operator Response: Do one of the following:

- Activate the subsystem.
- Ensure that an automated operation will activate the subsystem.

System Programmer Response: Change the value of the SUBSYS keyword in the current parmlib configuration to the name of an active subsystem.

ASB012I THE SUBSYSTEM *subsystm* DOES NOT EXIST.

Explanation: The subsystem specified on the SUBSYS keyword in the current parmlib configuration is not defined to the system.

In the message text:

subsystm The specified subsystem.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCHVS

System Action: The system stops processing until the SUBSYS keyword indicates a valid subsystem.

Operator Response: Notify the system programmer. After the system programmer corrects the problem, enter a SET command to process the current parmlib configuration.

System Programmer Response: Check the IEFSSN*xx* parmlib member for a correct subsystem name. Enter a correct subsystem name in the current parmlib configuration.

© Copyright IBM Corp. 1988, 1999

ASB025I INCORRECT CHARACTERS SPECIFIED FOR ASCH PARMLIB MEMBER VALUE.

Explanation: On a START ASCH command or a SET ASCH command, the operator specified an incorrect suffix on one or more ASCH parmlib members.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPX

System Action: The system stops processing the incorrect ASCH parmlib member(s). The system continues other processing.

Operator Response: Enter the START ASCH or SET ASCH command again, specifying a valid ASCH parmlib member suffix. Correct suffix values are alphanumeric characters or national characters.

ASB026I ASCHPM*xx* IGNORED. MEMBER IS EMPTY.

Explanation: The parmlib member specified on a START ASCH or SET ASCH command is empty.

In the message text:

ASCHPM*xx* The empty parmlib member, with the suffix *xx*.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPA

System Action: The system stops processing the empty parmlib member. The system processes the next ASCH parmlib member, if one was specified in the current configuration.

Operator Response: Notify the system programmer. After the system programmer has corrected the problem, enter the SET ASCH command to process the parmlib member.

System Programmer Response: Enter valid data in the ASCH parmlib member.

ASB027I ASCHPM*xx* : LINE *num1* - *num2* IGNORED. UNBALANCED COMMENT DETECTED.

Explanation: In an ASCHPM*xx* parmlib member, the system found one of the following:

- A starting comment delimiter (/*) with no matching ending comment delimiter (*/)
- An ending comment delimiter with no starting comment delimiter

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num1 The line number in the ASCHPM*xx* parmlib member where the unbalanced comment began.

num2 The line number in the ASCHPM*xx* parmlib member where the unbalanced comment ended.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPA

System Action: The system does not process the statement with the unbalanced comment. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer has corrected the problem, enter the SET ASCH command to process the ASCHPM*xx* parmlib member

System Programmer Response: Do the following:

- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB028I ASCHPM*xx* : LINE *num stmt* STATEMENT IGNORED. STATEMENT TYPE NOT RECOGNIZED.

Explanation: The system found an incorrect statement type in an ASCHPM*xx* parmlib member.

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the parmlib member where the incorrect statement began.

stmt The name of the incorrect statement.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPA

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer corrects the problem, enter the SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB029I ASCHPM*xx*: LINE *num* {CLASSADD | CLASSDEL} STATEMENT IGNORED. NO OPERANDS SPECIFIED.

Explanation: In the ASCHPM*xx* parmlib member, the system found a CLASSADD or CLASSDEL statement that contains no operands.

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the ASCHPM*xx* parmlib member where the incorrect statement began.

CLASSADD The system found an error in a CLASSADD statement.

CLASSDEL The system found an error in a CLASSDEL statement.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCCA

System Action: The system does not process the statement with no operands. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer corrects the problem, enter the SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB030I **ASCHPM*xx* : LINE *num* {CLASSADD | CLASSDEL} STATEMENT IGNORED. NO CLASSNAME KEYWORD SPECIFIED.**

Explanation: A statement in the specified parmlib member does not contain a required keyword.

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the ASCHPM*xx* parmlib member where the incorrect statement began.

CLASSADD The system found an error in a CLASSADD statement.

CLASSDEL The system found an error in a CLASSDEL statement.

keyword The missing keyword.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCCA

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer corrects the problem, enter the SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB031I **ASCHPM*xx* : LINE *num stmt* STATEMENT IGNORED. DUPLICATE KEYWORD *keyword* SPECIFIED.**

Explanation: The system found a statement with a duplicate keyword.

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the ASCHPM*xx* parmlib member where the incorrect statement began.

stmt The name of the statement in error, which is one of the following:

- CLASSADD
- CLASSDEL
- OPTIONS
- TPDEFAULT

keyword The duplicate keyword, which is one of the following:

- CLASSNAME
- DEFAULT
- MAX
- MIN
- MSGLEVEL
- MSGLIMIT
- OUTCLASS
- REGION
- RESPGOAL
- SUBSYS
- TIME

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCCA

ASBSCOP

System Action: The system rejects the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB032I **ASCHPM*xx* : LINE *num stmt* STATEMENT IGNORED. VALUE SPECIFIED FOR KEYWORD *keyword* IS NOT VALID.**

Explanation: The system found a statement with an incorrect keyword value.

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the ASCHPM*xx* parmlib member where the bad statement began.

stmt The name of the statement in error, which is one of the following:

- CLASSADD
- CLASSDEL
- OPTIONS
- TPDEFAULT

keyword The keyword that contains an incorrect value, which is one of the following:

- CLASSNAME
- DEFAULT
- MAX
- MIN
- MSGLEVEL
- MSGLIMIT
- OUTCLASS
- REGION
- RESPGOAL
- SUBSYS
- TIME

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCCA, ASBSCOP

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the keyword for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB033I **ASCHPM*xx* : LINE *num stmt* STATEMENT IGNORED. UNRECOGNIZED KEYWORD: *keyword*.**

Explanation: The system found a statement with an unrecognized keyword.

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the ASCHPM*xx* parmlib member where the incorrect statement began.

stmt The name of the incorrect statement, which is one of the following:

- CLASSADD
- CLASSDEL
- OPTIONS
- TPDEFAULT

keyword The unrecognized keyword.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCCA, ASBSCOP

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if any exists.

Operator Response: Notify the system programmer. After the system programmer corrects the problem, enter the SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the keyword for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB034I **ASCHPM*xx* : LINE *num stmt* STATEMENT IGNORED. MISSING RIGHT PARENTHESIS FOR A KEYWORD VALUE SPECIFIED IN THE STATEMENT.**

Explanation: The system found a statement with a keyword value that had no right parenthesis. The keyword was followed by another keyword.

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the ASCHPM*xx* parmlib member where the incorrect statement began.

stmt The name of the incorrect statement, which is one of the following:

- CLASSADD
- CLASSDEL
- OPTIONS
- TPDEFAULT

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCCA, ASBSCOP

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the lines in the parmlib member for unbalanced parentheses. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB035I **ASCHPM*xx* : LINE *num stmt* STATEMENT IGNORED. NO VALUE SPECIFIED FOR KEYWORD *keyword*.**

Explanation: The system found one of the following:

- A keyword with an incorrect value, or no left parenthesis.
- A syntax error

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the ASCHPM*xx* parmlib member where the incorrect statement began.

stmt The name of the statement containing the incorrect keyword value or no left parenthesis, which is one of the following:

- CLASSADD
- CLASSDEL
- OPTIONS
- TPDEFAULT

keyword The incorrect keyword, which is one of the following:

- CLASSNAME
- DEFAULT
- MAX
- MIN
- MSGLEVEL
- MSGLIMIT
- OUTCLASS
- REGION
- RESPGOAL
- SUBSYS
- TIME
- WORKQ

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCCA, ASBSCOP

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB036I **ASCHPM*xx* : STARTING LINE *num* MEMBER IGNORED. *stmt* STATEMENT TEXT EXCEEDS 4096 CHARACTERS.**

Explanation: One of the following conditions exists in the ASCHPM*xx* parmlib member:

- A statement is too long
- A statement contains a syntax error

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

num The line number in the ASCHPM*xx* parmlib member where the incorrect statement began.

stmt The name of the incorrect statement, which is one of the following:

- CLASSADD
- CLASSDEL
- OPTIONS
- TPDEFAULT

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPA

System Action: The system does not process the incorrect member. The system processes the next ASCH*xx* parmlib member, if one exists.

Operator Response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System Programmer Response: Do the following:

- Check the lines in the parmlib member for statements that exceed 4096 characters.
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

ASB038I ASCHPM*xx* : *stmtrec*

Explanation: This message displays the ASCH parmlib member and the statement that the system is processing in that parmlib member.

In the message text:

ASCHPM*xx* The parmlib member, with the suffix *xx*.

stmtrec The statement record that the system is currently processing.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPA

System Action: The system continues processing.

ASB039I SET ASCH COMMAND IGNORED. ASCH NOT ACTIVE.

Explanation: The operator entered the SET ASCH command when ASCH was:

- Not started
- Initializing
- Ending

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPS

System Action: The system rejects the SET ASCH command.

Operator Response: Enter a DISPLAY ASCH command to check the ASCH component status. Determine when you can enter the SET ASCH command again.

ASB040I SYSTEM ERROR ENCOUNTERED IN ASCH PARMLIB PROCESSING.

Explanation: The system found unexpected errors when processing the Advanced Program-to-Program Communication scheduler (ASCH) parmlib member(s).

A temporary loss of system storage may have caused this problem.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPS, ASBSCPX, ASBSCPA, ASBSCAD, ASBSCOP, ASBSCCK

System Action: The system writes an SVC dump to the SYS1.DUMP*xx* data set. The system continues processing. Processing of the parmlib member may be incomplete.

Operator Response: Enter a DISPLAY ASCH command to check the ASCH configuration status. Determine if you should enter a SET ASCH command to update the current parmlib configuration.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

ASB050I ASCH IS RESTARTING. FAILURE CODE = *failcde*

Explanation: The Advanced Program-to-Program Communication scheduler (ASCH) abended while initializing or processing ASCH work.

In the message text:

failcde A hex reason code that explains the error, as follows:

Reason Code	Explanation
0000001	The failure occurred during ASCH processing.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCSM, ASBSCIN

System Action: The system does the following:

1. Ends the APPC/MVS transaction scheduler temporarily
2. Writes an SVC dump, if an abend occurred
3. Tries to restart the APPC/MVS transaction scheduler
4. Issues message ASB052I when the APPC/MVS transaction scheduler returns to active state
5. Does not process work that was in progress when the abend occurred
6. Notifies the requestor of work that was not completed

Operator Response: After the system issues message ASB052I, enter commands that were not processed, as desired.

System Programmer Response: Identify the problem using the SVC dump and any APPC trace records. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ASB051I ASCH IS TERMINATING. FAILURE CODE = *failcde*

Explanation: The APPC/MVS transaction scheduler abended while initializing or processing ASCH work.

In the message text:

failcde The hex reason code that explains the error, as follows:

Reason Code	Explanation
0000001	Restrictions for allowing a restart were not met. The abend is the second non-recoverable error to occur within one hour.
0000002	An internal error occurred while the system was initializing the APPC scheduler.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCSM, ASBSCST

System Action: The system does the following:

1. Ends the APPC/MVS transaction scheduler
2. Writes a dump to the SYS1.DUMP data set, if an abend occurred
3. Makes the trace records available in the dump, if a trace was active for APPC
4. Issues message ASB050I after issuing the first abend
5. Does not process the work sent to the APPC/MVS transaction scheduler
6. Issues message ASB053I when the APPC/MVS transaction scheduler ends.

Operator Response: Enter the START ASCH command to start a new APPC/MVS transaction scheduler. See *OS/390 MVS System Commands* for details on starting the APPC/MVS transaction scheduler. If the problem recurs, notify the system programmer.

System Programmer Response: Identify the problem using the system dump and the APPC trace records.

ASB052I ASCH IS ACTIVE.

Explanation: The Advanced Program-to-Program Communication scheduler (ASCH) is ready to process work requests.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCSM

System Action: The system continues processing.

ASB053I ASCH HAS TERMINATED.

Explanation: The APPC/MVS transaction scheduler ended.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCSM

System Action: The APPC/MVS transaction scheduler ends.

Operator Response: Enter the START ASCH command to start the APPC/MVS transaction scheduler. See *OS/390 MVS System Commands* for details on starting the APPC/MVS transaction scheduler.

System Programmer Response: If a CANCEL or FORCE command did not cause the APPC/MVS transaction scheduler to end, look in the SVC dump to determine the problem. Identify the problem using the system dump. If CTRACE was turned on, analyze the component trace records. The reason code issued with message ASB051I may be helpful in determining the error.

ASB054I ASCH ALREADY STARTED. SUBSEQUENT REQUEST WAS IGNORED.

Explanation: An attempt was made to START the APPC/MVS transaction scheduler while an ASCH address space was already in place on the system.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCIN

System Action: The system ends the subsequent START request. The system continues processing.

Operator Response: If you do not want to continue processing in the current ASCH address space, enter a CANCEL or FORCE command to take the address space offline. Then enter a START ASCH command to start a new ASCH address space.

ASB055I START ASCH SYNTAX IS INCORRECT. COMMAND IGNORED.

Explanation: The syntax of the START ASCH command is incorrect.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCIN

System Action: The system does not process the START ASCH command.

Operator Response: See *OS/390 MVS System Commands* for the correct syntax for the START ASCH command. Correct the syntax. Enter the command again.

ASB056I ASCH IS INITIALIZING

Explanation: The Advanced Program-to-Program Communication (APPC0) scheduler (ASCH) has begun its initialization process.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCSM

System Action: The system continues processing.

ASB057I ASCH UNABLE TO OBTAIN A TRANSACTION FROM APPC.

Explanation: The APPC/MVS transaction scheduler tried to obtain a transaction from the APPC component. The system could not obtain the transaction because:

- A system error occurred
- The load on the system was too high

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCPR

System Action: The system notifies the transaction requestor that the request could not be serviced.

User Response: Retry the conversation.

ASB058I SUB=MSTR NOT SPECIFIED ON START ASCH. COMMAND IGNORED.

Explanation: The START ASCH command did not specify SUB=MSTR. The SUB=MSTR parameter must be specified.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCIN

System Action: The APPC/MVS transaction scheduler is not available.

Operator Response: Enter the START ASCH command again, specifying SUB=MSTR. See *OS/390 MVS System Commands* for the correct syntax.

ASB059I ASCH IS TERMINATING DUE TO OPERATOR {CANCEL | FORCE}

Explanation: The APPC/MVS transaction scheduler is ending because the operator entered a CANCEL or FORCE command.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCRE, ASBSCST

System Action: The system makes all ASCH address space services unavailable. The system ends all conversations associated with the APPC/MVS transaction scheduler. The idol initiator ends when the system tries to obtain more work from the APPC/MVS transaction scheduler. When the APPC/MVS transaction scheduler ends, the system issues message ASB053I.

Operator Response: To start a new APPC/MVS transaction scheduler, enter a START ASCH command after the system issues message ASB053I. See *OS/390 MVS System Commands* for the START ASCH command syntax.

ASB060I ASCH FAILED TO START CLASS *classname* **INITIATORS.**

Explanation: The APPC/MVS transaction scheduler failed to start initiators for the class *classname*. Possible causes of this error are:

- The ASCHINT procedure is missing from SYS1.PROCLIB
- The ASCHINT procedure contains JCL errors.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCT2

System Action: The system continues processing. No initiators are started until the problem is corrected.

Operator Response: Notify the system programmer. At the request of the system programmer, issue the SET ASCH=xx command to resume attempts to start initiators. If necessary, see *OS/390 MVS System Commands* for the SET ASCH command syntax.

System Programmer Response: Make sure that the ASCHINT procedure is in SYS1.PROCLIB. If it is, check for any JCL errors and correct them. Then, ask the operator to restart initiators through a SET ASCH=xx operator command, specifying an ASCHPMxx parmlib member that contains one CLASSADD statement for each class that needs to be restarted.

ASB080I MSGLIMIT HAS BEEN EXCEEDED. START OF MESSAGE WRAP.

Explanation: The number of messages written to the TP message log by a multi-trans transaction program (TP) exceeds the limit specified in MSGLIMIT field in the current parmlib configuration.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCMG

System Action: The system issues this message to the TP message log. When the number of messages exceeds the value of MSGLIMIT, the messages wrap in the following manner:

- The first message overwritten will immediately follow the messages that were written before the first Get_Transaction was issued.
- The initial messages will not be overwritten.
- The system writes message ASB080I to the TP message log before the first message where the wrapping begins.

ASB081I MSGLIMIT HAS BEEN EXCEEDED. END OF MESSAGE WRAP.

Explanation: The number of messages written to the TP message log by a multi-trans transaction program (TP) exceeds the limit specified in MSGLIMIT in the current parmlib configuration.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCMG

System Action: The system ends processing for the TP. If the messages in the job/message log were wrapping, the system issues this message to the TP message log to mark where the wrapping ends. The system continues other processing.

ASB082I MSGLIMIT HAS BEEN EXCEEDED. MESSAGE PROCESSING TERMINATED.

Explanation: The number of messages written to the job/message log exceeds the limit specified in the MSGLIMIT field of the current parmlib configuration.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCMG

System Action: For a transaction program (TP) with a schedule type of standard, the system issues this message to the job/message log and stops message processing.

For a multi-trans TP, if the MSGLIMIT is reached before the first Get_Transaction, the messages will not wrap. The system writes this message to the job/message log and stops message processing.

User Response: After the system programmer increases the value of MSGLIMIT, submit the TP again.

System Programmer Response: Increase the value of MSGLIMIT in the current parmlib configuration.

ASB083I JOBLOG PROCESSING ENDED DUE TO ALLOCATION FAILURE. REASON CODE = *reason-code***, DSN =** *dsname*

Explanation: The system encountered an error while trying to allocate a dataset for the TP message log. The reason code explains the error.

In the message text:

reason-code The hexadecimal reason code explaining the error is one of the following:

0	Internal error.
Non-zero	The SVC 99 decimal error code from the request block field. S99ERROR. See *OS/390 MVS Programming: Authorized Assembler Services Guide* for an explanation of the error code.

DSN = *dsname* The name of the dataset that the system could not allocate.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCAL

System Action: Processing continues, but APPC does not write messages to the TP Message log.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure that the MESSAGE_DATA_SET keyword in the TP profile is correct. Try using a different dataset name for the TP message log if necessary.

If the error persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ASB084I JOBLOG PROCESSING ENDED DUE TO OPEN FAILURE. DSN = *dsname*

Explanation: The system encountered an error while trying to open a dataset for the TP message log.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ASBSCWL

System Action: Processing continues, but APPC does not write messages to the TP Message log. The system issues abend X'13' and message IEC143I prior to this message.

Operator Response: Notify the system programmer.

System Programmer Response: Follow the system programmer response for abend code X'13' and message IEC143I.

Make sure that the MESSAGE_DATA_SET keyword in the TP profile is correct. Try using a different dataset name for the TP message log if necessary.

ASB101I *hh.mm.ss* **ASCH DISPLAY [***id***]**

Explanation:

```
CLASSES      ACTIVE TRANS      QUEUED TRANS      IDLE INITS      TOTAL INITS
ccccc        aaaaa             qqqqq             iiiii           ttttt
[REGION      TIME              MSGLEVEL          OUTCLASS        SUBSYS
region       mmmm,ss           s,m               oc              subsys]
[CLASS=class      STATUS=status          ACTIVE TRANS=aaaaa      MIN=minim
                  RESPGOAL=rrrrrrrr      QUEUED TRANS=qqqqq      MAX=maxim
                  DEFAULT={YES|NO}       IDLE INITS=iiiii
[LTPN=tpname|X'hh'ccc
                  STATUS=status          WUID=workid             ASID=asid
                  TPST=tp_sched_type     USERID=userid           QT=nnnnnnnn
                  JOBNAME=jobname]]
```

This message appears when the operator enters a DISPLAY ASCH command.

The variables in the first line are:

hh.mm.ss
Hour, minute, and second (or **00.00.00** if the time of day (TOD) clock is not working).

id A 3-digit decimal identifier, used with the CONTROL C,D command to cancel status displays being written on typewriter or printer consoles or being displayed inline (that is, not in a display area) on a display console. This identifier does not appear when the display is presented in a display area on a display console.

If any keyword filters were entered on the command, the numbers reflect only data that meets the specified criteria.

CLASSES
ccccc
The number of Advanced Program-to-Program Communication (APPC/MVS) transaction scheduler classes currently defined. This count includes both ACTIVE and TERMINATING classes. TERMINATING means the class has been removed from the system with a SET command, but the system allows the transaction programs already running or queued to complete.

ACTIVE TRANS
aaaaa
The total number of active transaction programs. The following TPs are considered active and are included in the count:

- Multi-trans TPs that are waiting for more work
- TPs that are “in transition” (the system is still preparing the transaction initiator and has not yet invoked the TP); JOBNAME=*NONE* is displayed in the message text for TPs that are in transition.

QUEUED TRANS
qqqqq
The total number of queued transaction program attach requests.

IDLE INITS
iiiii The number of transaction initiators that are not currently running a transaction program. This count includes all idle initiators for each class, as well as idle initiators that are not assigned to any class. These initiators are available to be assigned to any class that may need them.

TOTAL INITS
ttttt
The total number of transaction initiators that are managed by the APPC/MVS transaction scheduler. This count includes both the active initiators (one for each ACTIVE TRANS), and the IDLE INITS.

The SUBSYS and TPDEFAULT information, as specified in parmlib, is:

REGION
region
The TPDEFAULT region size. *region* has a value range of one through 9999 kilobytes, and one through 2047 megabytes.

TIME
mmmm,ss
The TPDEFAULT time limit. *mmmm,ss* is the time limit in minutes (from one to 1440) and in seconds (from one to 59).

MSGLEVEL
s,m
The TPDEFAULT message level. *s* has a possible value of 0, 1, or 2. *m* has a possible value of 0 or 1.

OUTCLASS
oc The TPDEFAULT output class. *oc* has a possible value of A through Z and 0 through 9.

SUBSYS
subsys
The name of the JES subsystem that all APPC/MVS transaction initiators are assigned. *subsys* is a 1- to 4-character string.

If the command includes the LIST parameter, lines six through eight (which describe an APPC/MVS transaction scheduler class) appear. They are repeated for each APPC/MVS transaction scheduler class, or for each APPC/MVS transaction scheduler class selected by the optional keyword parameters. The information given for each APPC/MVS scheduler class is:

CLASS=*class*
The name of the APPC/MVS transaction scheduler class. *class* is a string eight characters long or less.

STATUS=*status*
Status of the CLASS. Possible values of *status* are:

- **ACTIVE**

  The APPC/MVS transaction scheduler class is active.

- **TERMINATING**

  The APPC/MVS transaction scheduler class is ending.

ACTIVE TRANS=*aaaaa*
The number of active transaction programs in this class. The following TPs are considered active and are included in the count:

- Multi-trans TPs that are waiting for more work
- TPs that are “in transition” (the system is still preparing the transaction initiator and has not yet invoked the TP); JOBNAME=*NONE* is displayed in the message text for TPs that are in transition.

Each of these active transaction programs is running in an active transaction initiator. *aaaaa* is a decimal number with a maximum value of 99999.

MIN=*minim*
The minimum number of initiators as defined in parmlib. *minim* is a decimal number with a maximum value of 99999.

RESPGOAL=*rrrrrrrr*
The RESPGOAL specified in parmlib for transactions running in this APPC/MVS transaction scheduler class. *nnnnnnnn* has one of these formats:

- *r.rrrrrr*

  When time is less than 10 seconds.

- *rrrr.rrr*

  When time is at least 10 seconds and less than 10000 seconds.

- *rrrrrrrr*

  When time is at least 10000 seconds and less than or equal to 31536000 seconds (1 year).

QUEUED TRANS=*qqqqq*
The number of queued transactions attach requests for this APPC/MVS transaction scheduler class. *qqqqq* is a decimal number with a maximum value of 99999.

MAX=*maxim*
The maximum number of initiators defined in parmlib. *maxim* is a decimal number with a maximum value of 99999.

DEFAULT={YES|NO}
YES if the APPC/MVS transaction scheduler class is the default class. **NO** if the APPC/MVS transaction scheduler class is not the default class. The default class is the class designated to be used by any transaction program that does not contain a class name in the transaction program profile.

IDLE INITS=*iiiii*
The number of transaction initiators that are currently assigned to this class but are not running transaction programs.

If the DISPLAY command includes the ALL parameter, each APPC/MVS scheduler class description may be followed by several occurrences of lines nine through 12. Lines nine through 12 describe each active transaction program and each queued transaction program attach request for the preceding class. Lines 9 through 12 might only be displayed for transaction programs and transaction program attach requests that meet criteria specified on optional parameters. The variables in lines nine through 12 are:

LTPN=*tpname***|X'***hh***'***ccc***
The local TP name or the SNA service TP name:

tpname The local TP name. *tpname* is a string 1 to 64 characters long.

X'*hh***'***ccc* The SNA service TP name:

hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.

ccc A character string, with a maximum length of 3.

STATUS=*status*
Status of the transaction program or the transaction program attach request. Possible values for *status* are:

- **QUEUED**

  The transaction program attach request is queued.

- **ACTIVE**

  The transaction program is active.

- **ACTIVE(W)**

  The transaction program is a multi-trans transaction program that is waiting for more work.

WUID=*workid*
Work unit identifier. For APPC/MVS transactions running in transaction initiators, this has the format A*xxxxxxx*, where *xxxxxxx* is a numeric character string.

ASID=*asid*
The address space identifier (ASID) of the transaction initiator. When displaying a queued transaction, this will be the ASID of the APPC/MVS of the APPC/MVS transaction scheduler. *asid* is a hexadecimal value with a maximum length of four characters.

TPST=*tp_sched_type*
The transaction program schedule type for this transaction program. *tp_sched_type* has possible values of **STANDARD** or **MULTITRANS**.

USERID=*userid*
The userid of the transaction program or transaction program attach request. This may have one of the following values:

- ***NONE***

  if the conversation is a SECURITY=NONE conversation.

- The generic userid defined in the TP profile

  if the transaction program is a multi-trans transaction program which is waiting for more work (STATUS=ACTIVE(W)), or is running under the generic

shell environment (during initialization or ending of the multi-trans TP).

- The userid of the user who issued the transaction request

QT=*nnnnnnnn*
The queue time for a queued transaction program attach request. *nnnnnnnn* has one of these formats, where *ttt* is milli-seconds, *sss* or *ss* is seconds, *mm* is minutes, and *hh* or *hhhhh* is hours:

- *sss.ttt*S

  when time is less than 1000 seconds.

- *hh.mm.ss*

  when time is at least 1000 seconds, but less than 100 hours.

- *hhhhh.mm*

  when time is at least 100 hours.

- ************

  when time exceeds 99999 hours.

- **NOTAVAIL**

  when TOD clock is not working.

- ***NONE***

  for an active transaction or transaction program.

JOBNAME=*jobname*
The job name of an active transaction program. *jobname* is a string with a maximum length of eight characters. For a queued transaction program attach request, this value is ***NONE***. For an active TP that is "in transition" (the system is still preparing the transaction initiator and has not yet invoked the TP), this value is ***NONE***.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODP

System Action: The system continues processing.

ASB105I DISPLAY ASCH SYNTAX ERROR. UNEXPECTED END OF COMMAND: *error*

Explanation: The system was expecting more operands on the DISPLAY ASCH command, but the system ended the command prematurely because a blank was encountered.

In the message text:

error A 20-character string preceding the unexpected end of the command.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODI

System Action: The system rejects the command.

Operator Response: Reenter the command. Make sure there are no blanks embedded in the command. The system interprets a blank as the end of command.

ASB106I DISPLAY ASCH SYNTAX ERROR. INVALID PARAMETER: *error*

Explanation: In the DISPLAY ASCH command, a parameter is not valid.

In the message text:

error A 20-character string starting with the parameter in error.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODI

System Action: The system rejects the command.

Operator Response: Reenter the command correctly.

ASB107I DISPLAY ASCH SYNTAX ERROR. INVALID DELIMITER AFTER PARAMETER: *error*

Explanation: The system found an incorrect delimiter in the DISPLAY ASCH command. For the DISPLAY ASCH command, delimiters are commas and equal signs.

In the message text:

error A 20-character string starting with the parameter preceding the incorrect delimiter.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODI

System Action: The system rejects the command.

Operator Response: Reenter the command correctly.

ASB108I DISPLAY ASCH SYNTAX ERROR. DUPLICATE KEYWORD PARAMETER: *error*

Explanation: In the DISPLAY ASCH command, a keyword parameter was entered more than once, which is not allowed.

In the message text:

error A 20-character string starting with the second occurrence of the duplicate keyword parameter.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODI

System Action: The system rejects the command.

Operator Response: Reenter the command correctly.

ASB109I DISPLAY ASCH SYNTAX ERROR. INVALID KEYWORD VALUE: *error*

Explanation: In the DISPLAY ASCH command, a keyword value was incorrectly specified.

In the message text:

error A 20 character string starting with the keyword that has the incorrect value.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODI

System Action: The system rejects the command.

Operator Response: Reenter the command correctly.

ASB110I DISPLAY ASCH UNAVAILABLE. ASCH IS NOT ACTIVE.

Explanation: The APPC/MVS transaction scheduler is not active.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODP

System Action: The system continues processing.

Operator Response: Enter the START ASCH command to initialize the APPC/MVS transaction scheduler, if necessary.

ASB111I DISPLAY ASCH UNAVAILABLE. ASCH IS STARTING.

Explanation: The APPC/MVS transaction scheduler is starting because either an operator entered a START ASCH command or the system performed an internal restart of the APPC scheduler. APPC scheduling services will be available soon.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODP

System Action: The system continues processing.

Operator Response: Try the command after the ASCH address space initialization completes, as indicated by message ASB052I.

ASB112I DISPLAY ASCH UNAVAILABLE. ASCH IS TERMINATING AND WILL AUTOMATICALLY RESTART.

Explanation: The APPC/MVS transaction scheduler is ending and will automatically begin reinitializing because of an internal error in the APPC/MVS scheduler. APPC/MVS scheduling services will be available soon.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODP

System Action: The system continues processing.

Operator Response: Try to enter the command after the ASCH address space initialization completes, as indicated by message ASB052I.

ASB113I DISPLAY ASCH UNAVAILABLE. ASCH IS TERMINATING.

Explanation: The APPC/MVS transaction scheduler is ending because either an operator entered a CANCEL or FORCE command, or the system detected an internal error in the ASCH address space.

Source: Advanced Program-to-Program Communication (APPC/MVS)

Detecting Module: ATBCODP

System Action: The system continues processing.

Operator Response: Wait for the ASCH address space to end, as indicated by message ASB053I. Then, if you wish to restart the ASCH address space, enter a START ASCH command.

ATB Messages

Note

This section does not contain explanations for the following types of messages:

- ASB7*xxxx*I messages - Error log information messages that the APPC transaction scheduler or an alternate scheduler returns to an APPC transaction program (TP).
- ATB6*xxxx*I messages - Error messages that the application program interface (API) trace facility returns to the issuer of an ATBTRACE request, or writes to the trace data set.
- ATB7*xxxx*I messages - Error log information messages that the Error_Extract service returns to an APPC TP.
- ATB8*xxxx*I messages - Error messages that the Error_Extract service returns to an APPC TP.

See *OS/390 MVS Programming: Writing TPs for APPC/MVS* for descriptions of those types of messages.

ATB001I APPC IS INITIALIZING.

Explanation: Advanced Program-to-Program Communication (APPC) has begun its initialization process.

Source: APPC/MVS

Detecting Module: ATBINSM

System Action: The system continues processing.

ATB002I APPC HAS TERMINATED.

Explanation: Advanced Program-to-Program Communication (APPC) has ended.

Source: APPC/MVS

Detecting Module: ATBINSM

System Action: APPC services are unavailable. The system issued message ATB006I, ATB012I, or ATB010I prior to this one indicating why APPC was ending. The system may issue an SVC dump.

Operator Response: Enter the START APPC command to start the APPC address space again. See *OS/390 MVS System Commands* for more information.

System Programmer Response: If the system previously issued message ATB0006I or ATB012I indicating that APPC ended because of an unrecoverable error, see the system programmer response for the preceding message.

ATB003I START APPC SYNTAX IS INCORRECT. COMMAND IGNORED.

Explanation: The value assigned to the APPC keyword on the START APPC command did not have the correct syntax.

Source: APPC/MVS

Detecting Module: ATBINIT

System Action: The system rejects the START command.

Operator Response: Correct the syntax and enter the START command again. See *OS/390 MVS System Commands* for more information.

ATB004I APPC ALREADY STARTED. SUBSEQUENT REQUEST WAS IGNORED.

Explanation: An attempt was made to start Advanced Program-to-Program Communication (APPC) while an APPC address space was already active.

Source: APPC/MVS

Detecting Module: ATBINIT

System Action: The system rejects the subsequent START command. The APPC address space already active continues processing.

Operator Response: If you do not want the existing APPC address space, cancel it with the CANCEL command. See *OS/390 MVS System Commands* for more information.

Once APPC has ended (indicated by message ATB002I), a new APPC address space can be started using the START APPC command.

ATB005I APPC IS RESTARTING. FAILURE CODE = *reason-code*

Explanation: Advanced Program-to-Program Communication (APPC) abnormally ended while initializing or while processing APPC work. The failure required the APPC address space to end, but APPC will attempt to restart itself. An SVC dump was produced at the time of the abend, and records are available if a trace was active for APPC.

In the message text, *reason-code* is one of the following:

Reason Code (hex)	Explanation
0004-000C	Internal error.

Source: APPC/MVS

System Action: APPC services are temporarily unavailable. The system issues message ATB007I when APPC becomes active again. The system rejects any work that has not completed and notifies the requestor (for example, the system rejects SET commands that were not processed before the abend, and notifies the issuing operator). Additionally, if the operator had started a trace on APPC before the abend, the trace will not be active following the restart. Excluding the commands that were rejected and system trace activity, APPC will restart with the same environment as existed before the abend.

Operator Response: After APPC becomes active (indicated by message ATB007I), reenter any commands that were rejected, if you still want the system to process them. If component trace was active before APPC abnormally ended, it will no longer be active following restart. See *OS/390 MVS Diagnosis: Procedures* for information about restarting component trace.

System Programmer Response: Identify the problem, using the system dump and the APPC trace records. APPC might have abnormally ended because of the frequency of abends (two abends within one hour). If so, an SVC dump was taken for each abend. This message was issued following the first abend. The abends might be unrelated.

Contact the IBM support center. Provide the SVC dump and the reason code issued by this message.

© Copyright IBM Corp. 1988, 1999

ATB006I APPC IS TERMINATING. RESTART CRITERIA NOT MET. FAILURE CODE = *rc*

Explanation: Advanced Program-to-Program Communication (APPC) abnormally ended while initializing or while processing APPC work. APPC will not attempt to restart itself.

In the message text:

Reason Code (hex)	Explanation
0001-000C	Internal error.

Source: APPC/MVS

System Action: APPC services are unavailable. The system rejects all incoming APPC work. Work already running on the system completes or ends. When APPC has ended, normally or abnormally, the system issues message ATB002I. The system writes an SVC dump.

Operator Response: Do not send any new work to APPC. To start a new APPC address space, do the following:

- Wait until the system issues message ATB002I and then enter the START APPC command.
- If the system does not issue message ATB002I, APPC has hung in the process of ending. Try entering the FORCE command.
- If the system still does not issue message ATB002I after you enter the FORCE command, the only way to start APPC is to reIPL the system.

System Programmer Response: Identify the problem, using the SVC dump and the APPC component trace records. APPC might have abnormally ended because of the frequency of abends (two abends within one hour). If so, an SVC dump was taken for each abend. The system issues message ATB005I following the first abend. The abends might be unrelated.

If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the reason code issued by this message.

ATB007I APPC IS ACTIVE.

Explanation: Advanced Program-to-Program Communication (APPC) is ready to process work.

Source: APPC/MVS

Detecting Module: ATBINSM

System Action: The system continues processing.

ATB008E APPC SYSTEM INITIALIZATION FAILED

Explanation: A failure occurred during initialization of Advanced Program-to-Program Communication (APPC) resources. The problem could be due to an APPC/cross-system coupling services (XCF) group error.

Source: APPC/MVS

Detecting Module: ATBINSY

System Action: System initialization continues without APPC resources established. APPC will not perform correctly if started. The system issues an SVC dump.

Operator Response: Do not enter the START APPC command. APPC will not perform correctly if it is started. Notify the system programmer. When the system programmer has fixed the problem, reIPL the system.

System Programmer Response: XCF is a prerequisite for APPC, so make sure that the APPC/XCF group is correctly established. See *OS/390 MVS Setting Up a Sysplex* for information on XCF groups.

If the APPC/XCF group was correct when the system issued this message, this is an internal error. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

ATB009I SUB=MSTR NOT SPECIFIED ON START APPC. COMMAND IGNORED.

Explanation: The START APPC command did not have SUB=MSTR specified. Both the keyword and the value are mandatory. Advanced Program-to-Program Communication (APPC) will not initialize without having SUB=MSTR specified.

Source: APPC/MVS

Detecting Module: ATBINIT

System Action: APPC services are unavailable.

Operator Response: Reenter the START APPC command with SUB=MSTR specified. For information about starting APPC, see *OS/390 MVS System Commands*.

ATB010I APPC IS TERMINATING DUE TO OPERATOR CANCEL

Explanation: The operator entered a CANCEL command to end APPC.

Source: APPC/MVS

Detecting Module: ATBINSM

ATBINIT

System Action: APPC services are unavailable. The system deallocates all active conversations. When APPC ends, the system will issue message ATB002I.

Operator Response: Do not send any new work to APPC. If you want to bring up a new APPC address space, wait until the system issues message ATB002I. Then enter the START APPC command. See *OS/390 MVS System Commands* for more information.

ATB011I APPC NOT STARTED DUE TO INITIALIZATION FAILURE

Explanation: The Advanced Program-to-Program Communication (APPC) job step task failed before the initialization of APPC global resources. The failure may be a result of a system service error or of an error in the APPC job step task.

Source: APPC/MVS

Detecting Module: ATBINIT

System Action: APPC services are unavailable. The system writes an SVC dump.

Operator Response: Do not send any work to APPC. Notify the system programmer.

System Programmer Response: If APPC abnormally ended because of a critical error after the APPC address space ended, use the SVC dump to identify the problem. If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM support center. Provide the SVC dump.

ATB012I APPC IS TERMINATING DUE TO OPERATOR FORCE OR DUE TO CRITICAL ERROR

Explanation: Advanced Program-to-Program Communication (APPC) is ending because either:

- An operator entered a FORCE APPC command.
- An internal error occurred.

Source: APPC/MVS

Detecting Module: ATBINSM

System Action: APPC services are unavailable. The system deallocates all active conversations. The system issues message ATB002I when APPC ends and may issue an SVC dump.

Operator Response: Do not send any new work to APPC. If you would like to bring up a new APPC address space, wait until the system issues message ATB002I. Then enter the START APPC command. See *OS/390 MVS System Commands* for more information.

System Programmer Response: If APPC did not end because of the FORCE command, identify the problem using the SVC dump. If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM support center. Provide the SVC dump.

ATB013E SYNTAX ERROR IN APPC INITIALIZATION INPUT PARAMETERS. START APPC COMMAND IGNORED.

Explanation: The system was unable to initialize Advanced Program-to-Program Communication (APPC) because of a syntax error in one of the following places:

- The APPC keyword specified in the START APPC command
- The subparameters specified in the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB

Source: APPC/MVS

Detecting Module: ATBINPR

System Action: The system continues processing without APPC.

Operator Response: Check the syntax of the APPC keyword value specified in the START APPC command. The value should be one of the following:

- A single two-character parmlib suffix
- A list of parmlib suffixes separated by commas and optionally ended by an L. You must enclose the list in parentheses.

See *OS/390 MVS System Commands* for the syntax of the START APPC command.

System Programmer Response: In the APPC member of SYS1.PROCLIB, check the syntax of the subparameters specified in the PARM parameter of the EXEC statement that invokes the APPC initialization routine.

The syntax must follow these rules:

- The required APPC subparameter must be a symbolic parameter corresponding to the one in the PROC statement. For example, if the parameter in the PROC statement is APPC=00, then the APPC subparameter should be APPC=&APPC.
- The optional BUFSTOR subparameter must be a 1- to 4-digit numeric value. Examples are BUFSTOR=1024 or BUFSTOR=88.
- The optional CONVBUFF subparameter must be a 1- to 7-digit numeric value. Examples are CONVBUFF=1000 or the maximum value of CONVBUFF=2097152.
- If you specify the APPC, BUFSTOR, and CONVBUFF subparameters (or any two of those three subparameters), you can specify them in any order, but you must separate each with a comma.
- You cannot specify the APPC, BUFSTOR, or CONVBUFF parameter more than once.

See the section on improving performance through system changes in *OS/390 MVS Planning: APPC/MVS Management* for more information about the APPC initialization subparameters.

ATB014I THE BUFFER STORAGE LIMIT HAS BEEN SET TO *number* MEGABYTES

Explanation: The system issues this message whenever Advanced Program-to-Program Communication (APPC) is started to display the storage limit for the transaction program (TP) send/receive buffer. The storage limit is the maximum amount of storage defined for the TP send/receive buffer.

You can define the storage limit for the TP send/receive buffer on the BUFSTOR subparameter of the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB. If you specify BUFSTOR=0, the system uses 2048 megabytes for the storage limit for the TP send/receive buffers. 2048 megabytes is the maximum storage available in an address space. If you don't specify a value on BUFSTOR, the system uses the default, which is approximately one third of the auxiliary storage that was free when APPC was started.

For recommendations about how to define the storage limit for the TP send/receive buffers, see *OS/390 MVS Planning: APPC/MVS Management*.

In the message text:

number The number of megabytes defined for the maximum amount of storage allowed for TP send/receive buffers (in decimal).

Source: APPC/MVS

Detecting Module: ATBVSIT

System Action: The system continues processing.

ATB015I APPC IS STARTING AFTER A FAILED RESTART. SPECIFIED PARMLIB MEMBER(S) ARE IGNORED.

Explanation: Advanced Program-to-Program Communication (APPC) is starting after an attempt to internally restart failed. Message ATB005I was issued prior to the issuance of this message to record that internal restart processing was being initiated. APPC will restart with the same environment that existed prior to the internal restart attempt. Any specified APPC parmlib members will be ignored. If the installation desires to change the APPC configuration to something other than what existed prior to the failed internal restart, APPC must be cancelled started again.

Source: APPC/MVS

Detecting Module: ATBINIT

System Action: APPC initialization processing continues to restore the logical unit configuration that existed prior to the failed internal restart. The system issues message ATB007I when APPC becomes active again.

System Programmer Response: Identify the problem that prevented APPC from internally restarting successfully. The reason for the failure may have been recorded by a symptom record written to the logrec data set or a message issued to the system log data set. Keep the symptom record or system log information for future reference as it may be needed for problem determination.

ATB016I THE AMOUNT OF BUFFER STORAGE AVAILABLE TO ONE CONVERSATION IS *number* KILOBYTES.

Explanation: Advanced Program-to-Program Communication (APPC) is started with the indicated amount of buffer space available to any one conversation. This message is issued to hardcopy only.

You can define the buffer space amount for a conversation on the CONVBUFF subparameter of the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB. The CONVBUFF value is a 1- to 7-digit number indicating, in kilobytes, the amount of buffer storage available to one conversation.

- If you specify a value between 1 and 39 on the CONVBUFF parameter, the system uses a value of 40 (because 40 kilobytes is the minimum buffer storage requirement per conversation).
- If you specify a value that is not a multiple of four kilobytes (decimal), the system rounds the value of CONVBUFF up to the next highest multiple of four. For example, if you specify CONVBUFF=1023, the system makes 1024 kilobytes of buffer storage available to one conversation.
- If you a specify a value that is greater than the total amount of buffer storage (which is specified on the BUFSTOR subparameter of the START APPC command), the system issues message ATB017I to the console, and allows a single conversation to have access to all of the APPC buffers.

The maximum possible value is CONVBUFF=2097152. If you do not specify a value for CONVBUFF, or if you specify a value of zero, the system uses a default of 1000 kilobytes.

In the message text:

number The amount of buffer space, in kilobytes, that is available to any one conversation. The number is displayed in decimal.

Source: APPC/MVS

Detecting Module: ATBVSIT

System Action: The system continues processing.

ATB017I CONVBUFF PARAMETER VALUE EXCEEDS BUFFER STORAGE LIMIT. DEFAULTING TO BUFFER STORAGE LIMIT.

Explanation: Advanced Program-to-Program Communication (APPC) was started. The value specified on the CONVBUFF parameter on the START APPC command is greater than the total amount of buffer storage available to APPC (which is either specified on the BUFSTOR parameter, or calculated by APPC). The amount of storage that each conversation is allowed is set to the total amount of buffer storage, which disables conversation level pacing.

Source: APPC/MVS

Detecting Module: ATBVSIT

System Action: The system continues processing.

Operator Response: No action is necessary if you do not want to enable conversation level pacing, which controls the amount of buffer space that any one conversation can obtain, so one conversation cannot obtain so much storage that it creates a shortage for other conversations. If you do want to enable conversation level pacing, see the section on “Improving Performance through System Changes” in *OS/390 MVS Planning: APPC/MVS Management* for information about how to specify a value on the CONVBUFF parameter in the APPC member of SYS1.PROCLIB.

ATB018E CRITICAL APPC/MVS ERROR. APPC SHOULD BE CANCELLED AND RESTARTED TO RESUME NORMAL INCOMING APPC WORK.

Explanation: APPC/MVS has encountered a number of critical errors. As a result, processing of new inbound FMH-5 attach requests is severely hampered or completely disabled.

Source: APPC/MVS

Detecting Module: ATBFMFP

System Action: APPC/MVS processing of new inbound FMH-5 attach requests is severely hampered or totally disabled. This message will likely be accompanied by ATB500E messages and APPC SVC dumps.

Operator Response: Contact the system programmer. At the request of the system programmer, cancel and restart the APPC address space.

System Programmer Response: Evaluate the current APPC/MVS workload running. If critical transaction programs are currently running, wait until they complete. Then, cancel the APPC address space and restart APPC again. Since this problem has resulted from a severe APPC/MVS internal error, search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center with the dump that was taken when the error occurred.

ATB022I APPC COULD NOT INITIALIZE DUE TO XCF NOTIFICATION FAILURE. APPC HAS RECEIVED RETURN CODE=*xxxxxxxx*, REASON CODE=*yyyyyyyy* FROM THE *servname* SERVICE.

Explanation: APPC/MVS was attempting to send the members of the APPC/MVS group notification that APPC has been activated. This notification attempt has failed due to a failure of an XCF macro. The return and reason codes from the specified XCF macro are supplied in the message.

In the message text:

xxxxxxxx is the return code and

yyyyyyyy is the reason code from the specified XCF macro.

servname is the failing XCF service.

Source: APPC/MVS

Detecting Module: ATBINSM

System Action: APPC/MVS terminates but may attempt to restart. APPC issues ATB007I or ATB002I to indicate whether the restart was successful.

Operator Response: If APPC does not successfully restart, notify the system programmer. At the request of the system programmer, restart the APPC address space.

System Programmer Response: If APPC does not successfully restart, determine the reason for the XCF failure. The service return and reason codes explain the error.

ATB023I FAILED TO JOIN the APPC/XCF GROUP. IXCJOIN RETURN CODE = *xxxxxxxx*, REASON CODE = *yyyyyyyy*.

Explanation: The APPC address space failed to join the Advanced Program-to-Program Communication (APPC)/cross-system coupling facility (XCF) group during initialization processing due to an environment error.

In the message text:

xxxxxxxx The return code from IXCJOIN (in hexadecimal).

yyyyyyyy The reason code from IXCJOIN (in hexadecimal).

Source: APPC/MVS

Detecting Module: ATBINGI

System Action: The system continues processing without APPC.

Operator Response: Notify the system programmer. At the request of the system programmer, restart the APPC address space.

System Programmer Response: The IXCJOIN return and reason codes explain the error. If, for example, the message shows a return code of 4 and a reason code of C, the maximum number of groups already exists.

For the other IXCJOIN return and reason codes, see *OS/390 MVS Programming: Sysplex Services Reference*. When you have corrected the problem, notify the operator to restart the APPC address space.

ATB024I INITIALIZATION OF APPC/XCF GROUP NAME FAILED: IXCQUERY RETURN CODE = *xxxxxxxx* **REASON CODE =** *yyyyyyyy***.**

Explanation: The system could not initialize Advanced Program-to-Program Communication (APPC)/cross-system coupling facility (XCF) group name because the IXCQUERY macro did not run successfully.

In the message text:

xxxxxxxx The return code from IXCQUERY (in hexadecimal).

yyyyyyyy The reason code from IXCQUERY (in hexadecimal).

Source: APPC/MVS

Detecting Module: ATBMIIN

System Action: The system continues initialization without establishing the APPC/XCF group name.

Operator Response: Notify the system programmer. Do not enter the START APPC command. If APPC is an integral part of the system, reIPL the system.

System Programmer Response: XCF is a prerequisite for APPC, so the XCF problem must be fixed in order for APPC to perform correctly.

Refer to the IXCQUERY return and reason codes for further information and diagnostics. If this error is due to IBM code issuing IXCQUERY incorrectly, then search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB025I INCORRECT CHARACTERS SPECIFIED FOR APPC PARMLIB MEMBER VALUE.

Explanation: On a START APPC or SET APPC command, the operator specified an incorrect suffix for one or more parmlib members.

Source: APPC/MVS

Detecting Module: ATBPLPX

System Action: The system stops processing the APPC parmlib member(s). The system continues processing.

Operator Response: Enter the START APPC or the SET APPC command again with a valid APPC parmlib member suffix. Correct suffix values are alphanumeric characters or national characters.

ATB026I APPCPM*xx* IGNORED. MEMBER IS EMPTY.

Explanation: The parmlib member specified on the START APPC or SET APPC command is empty.

In the message text:

APPCPM*xx* The parmlib member, with suffix *xx*.

Source: APPC/MVS

Detecting Module: ATBPLPR

System Action: The system stops processing the parmlib member. The system continues processing the next parmlib member specified on the command, if one exists.

Operator Response: Notify the system programmer. After the system programmer corrects the problem, enter the SET APPC command to process the parmlib member.

System Programmer Response: Correct the APPCPMxx parmlib member.

ATB027I APPCPM*xx*: LINE *num1* - *num2* IGNORED. UNBALANCED COMMENT DETECTED.

Explanation: In the APPCPM*xx* parmlib member, the system found one of the following:

- A starting comment delimiter (/*) with no matching ending comment delimiter (*/)
- An ending comment delimiter with no starting comment delimiter

In the message text:

APPCPM*xx* The parmlib member, with the suffix *xx*.

num1 The line number in APPCPMxx where the unbalanced comment began.

num2 The line number in APPCPMxx where the unbalanced comment ended.

Source: APPC/MVS

Detecting Module: ATBPLPR

System Action: The system does not process the statement containing the unbalanced comment. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Notify the system programmer.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check lines *num1* through *num2* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB028I APPCPM*xx*: LINE *num statement* STATEMENT IGNORED. STATEMENT TYPE NOT RECOGNIZED.

Explanation: The system found an incorrect statement in an APPCPM*xx* parmlib member.

In the message text:

APPCPM*xx* The parmlib member, with the suffix *xx*.

num The line number in APPCPMxx where the incorrect statement began.

statement The incorrect statement.

Source: APPC/MVS

Detecting Module: ATBPLPR

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB029I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. NO OPERANDS SPECIFIED.**

Explanation: In the specified parmlib member, the system encountered a statement containing no operands.

In the message text:

APPCPM*xx* The parmlib member, with the suffix *xx*.

num The line number in APPCPMxx where the incorrect statement began.

statement The statement in error. The value for *statement* is one of the following:

- LUADD
- LUDEL

Source: APPC/MVS

Detecting Module: ATBPLUA

System Action: The system does not process the statement without operands. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB030I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. NO** *keyword* **KEYWORD SPECIFIED.**

Explanation: In the specified parmlib member, a statement does not contain a required keyword.

In the message text:

APPCPM*xx* The APPCPMxx parmlib member.

num The line number in APPCPMxx where the incorrect statement began.

statement The statement that is in error. The value for *statement* is one of the following:

- LUADD
- LUDEL

keyword The missing keyword.

Source: APPC/MVS

Detecting Module: ATBPLUA

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB031I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. DUPLICATE KEYWORD** *keyword* **SPECIFIED.**

Explanation: In the specified parmlib member, a statement contains a duplicate keyword.

In the message text:

APPCPM*xx* The parmlib member, with the *xx* suffix.

num The line number in APPCPMxx where the incorrect statement began.

statement The statement in error. The value for *statement* is one of the following:

- LMADD
- LMDEL
- LUADD
- LUDEL
- SIDEINFO

keyword The duplicate keyword. The value for *keyword* is one of the following:

- ACBNAME
- BASE
- DATASET
- GRNAME
- LOGMODE
- LUNAME

- MINWINL
- MINWINR
- NONQN
- NOPERSIST
- NQN
- PERSIST
- PSTIMER
- SCHED
- SESSLIM
- TPDATA
- TPLEVEL

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

Source: APPC/MVS

Detecting Module: ATBPLUA, ATBPLMA, ATBPLDF

System Action: The system rejects the duplicate keyword. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB032I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. VALUE SPECIFIED FOR KEYWORD** *keyword* **IS NOT VALID.**

Explanation: The system found a statement with an incorrect keyword value.

In the message text:

APPCPM*xx* The parmlib member, with the *xx* suffix.

num The line number in APPCPMxx where the incorrect statement began.

statement The statement in error. The value for *statement* is one of the following:

- LMADD
- LMDEL
- LUADD
- LUDEL
- SIDEINFO

keyword The keyword containing an incorrect value. The *keyword* is one of the following:

- ACBNAME
- DATASET
- GRNAME
- LOGMODE
- LUNAME
- MINWINL
- MINWINR
- PSTIMER
- SCHED
- SESSLIM
- TPDATA
- TPLEVEL

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

Source: APPC/MVS

Detecting Module: ATBPLUA, ATBPLMA, ATBPLDF

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB033I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. UNRECOGNIZED KEYWORD:** *keyword***.**

Explanation: The system found a statement with an unrecognized keyword.

In the message text:

APPCPM*xx* The parmlib member, with suffix *xx*.

num The line number in APPCPMxx where the incorrect statement began.

statement The incorrect statement. The *statement* is one of the following:

- LMADD
- LMDEL
- LUADD
- LUDEL
- SIDEINFO

keyword The unrecognized keyword.

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

Source: APPC/MVS

Detecting Module: ATBPLUA, ATBPLMA, ATBPLDF

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB034I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. MISSING RIGHT PARENTHESIS FOR A KEYWORD VALUE SPECIFIED IN THE STATEMENT.**

Explanation: The system found a statement in parmlib member APPCPM*xx* that contained one of the following errors:

- A keyword value that had a right parenthesis missing.
- A correct keyword value with a suffix added. Keyword values cannot have suffixes.

In the message text:

APPCPM*xx* The parmlib member, with suffix *xx*.

num The line number in APPCPMxx where the incorrect statement began.

statement The incorrect statement. The *statement* is one of the following:

- LMADD
- LMDEL
- LUADD
- LUDEL
- SIDEINFO

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

Source: APPC/MVS

Detecting Module: ATBPLUA, ATBPLMA, ATBPLDF

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB035I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. NO VALUE SPECIFIED FOR KEYWORD** *keyword***.**

Explanation: In the specified parmlib member, a statement contains either an incorrect record or a syntax error.

In the message text:

APPCPM*xx* The parmlib member, with suffix *xx*.

num The line number in APPCPMxx where the incorrect statement began.

statement The statement containing the error. The *statement* is one of the following:

- LMADD
- LMDEL
- LUADD
- LUDEL
- SIDEINFO

keyword The keyword containing the error. The *keyword* is one of the following:

- ACBNAME
- DATASET
- GRNAME
- LOGMODE
- LUNAME
- MINWINL
- MINWINR
- PSTIMER
- SCHED
- SESSLIM
- TPDATA
- TPLEVEL

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

Source: APPC/MVS

Detecting Module: ATBPLUA, ATBPLMA, ATBPLDF

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.

- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB036I APPCPM*xx*: STARTING LINE *num* MEMBER IGNORED. *statement* STATEMENT TEXT EXCEEDS 4096 CHARACTERS.

Explanation: In the specified parmlib member, a statement is too long or contains a syntax error.

In the message text:

APPCPM*xx* The parmlib member, with the *xx* suffix..

num The line number in APPCPMxx where the incorrect statement began.

statement The statement in error. The *statement* is one of the following:

- LMADD
- LMDEL
- LUADD
- LUDEL
- SIDEINFO

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

Source: APPC/MVS

Detecting Module: ATBPLPR

System Action: The system does not process the rest of this parmlib member. Any prior valid statements processed are accepted.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB038I APPCPM*xx*: *stmtrec*

Explanation: This message displays the Advanced Program-to-Program Communication (APPC) parmlib member and the statement that the system is processing.

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

In the message text:

APPCPM*xx* The parmlib member, with the *xx* suffix..

stmtrec The statement record the system is currently processing.

Source: APPC/MVS

Detecting Module: ATBPLPR

System Action: The system continues processing.

ATB039I SET APPC COMMAND IGNORED. APPC NOT ACTIVE.

Explanation: The operator entered a SET APPC command, but Advanced Program-to-Program Communication (APPC) is not active. You cannot enter the SET APPC command when one of the following is true:

- APPC is not started.
- APPC is initializing.
- APPC is ending.

Source: APPC/MVS

Detecting Module: ATBPLPS

System Action: The system rejects the SET APPC command.

Operator Response: Enter a DISPLAY APPC command to check APPC system status and to determine when you can enter the SET APPC command.

ATB040I SYSTEM ERROR ENCOUNTERED IN APPC PARMLIB PROCESSING.

Explanation: The system found unexpected system error(s) while processing the Advanced Program-to-Program Communication (APPC) parmlib member(s). START APPC or SET APPC command processing may be incomplete.

This problem might be due to either a temporary system storage shortage, or loss of some APPC parmlib statements.

Source: APPC/MVS

Detecting Module: ATBPLPS, ATBPLPX, ATBPLPR, ATBPLUA, ATBPLMA, ATBPLDF, ATBPLCK, ATBLUPL, ATBSD93

System Action: Command processing may be incomplete. The system writes an SVC dump and continues processing.

Operator Response: Notify the system programmer.

System Programmer Response: Enter the DISPLAY APPC command to verify the APPC system configuration. Determine whether you should enter a SET APPC command to update current configuration.

If the problem recurs, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

ATB041I APPCPM*xx*: LINE *num statement* STATEMENT IGNORED. *keyword1* AND *keyword2* ARE MUTUALLY EXCLUSIVE.

Explanation: In the specified parmlib member, a statement was found to contain keywords or keyword values that are mutually exclusive.

In the message text:

APPCPM*xx* The parmlib member, with suffix *xx*.

num The line number in APPCPMxx where the incorrect statement began.

statement The name of the statement containing the error. The *statement* is as follows:

- LMADD, LUDEL

keyword1 **and** *keyword2* The keywords or values that are mutually exclusive. They can be one of the following pairs:

- SCHED and NOSCHED
- NOSCHED and TPLEVEL(GROUP)
- NOSCHED and TPLEVEL(USER)
- NQN and NONQN
- PERSIST and NOPERSIST

Source: APPC/MVS

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for the mutually exclusive keywords or keyword values. Then do one of the following:

- Correct the error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB042I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. STATEMENT TYPE NO LONGER SUPPORTED.**

Explanation: Advanced program-to-program communication (APPC) no longer supports the specified statement found in the APPCPMxx member of SYS1.PARMLIB.

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

In the message text:

APPCPM*xx* The parmlib member, with the suffix xx

num The line number in APPCPMxx where the incorrect statement began.

statement The statement in error. The value for *statement* is one of the following:

- LMADD
- LMDEL

Source: APPC/MVS

System Action: The system ignores the statement. The system processes the next statement in the APPCPMxx member, if one exists.

Operator Response: Ask the system programmer to remove the LMADD and LMDEL statements from the APPCPMxx member.

System Programmer Response: Remove the LMADD and LMDEL statements from the APPCPMxx member. If changing session limits is desired, refer to *OS/390 SecureWay Communications Server: SNA Operation* for additional information on VTAM operator commands and *OS/390 SecureWay Communications Server: SNA Resource Definition Reference* for information on the VTAM APPL definition statement.

ATB043I **APPCPM*xx*: LINE** *num statement* **STATEMENT IGNORED. GENERIC RESOURCE NAME** *grname* **IS THE SAME AS THE LOGICAL UNIT NAME.**

Explanation: In the specified parmlib member, a statement contains ACBNAME and GRNAME parameters, both specifying the same name.

In the message text:

APPCPM*xx* The parmlib member, with suffix *xx*.

num The line number in APPCPMxx where the incorrect statement began.

statement The statement containing the error. The *statement* is LUADD.

Source: APPC/MVS

Detecting Module: ATBPLUA

System Action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator Response: Ask the system programmer to find and fix the error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

System Programmer Response: Check line number *num* in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statements needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

ATB050I **LOGICAL UNIT** *luname* **FOR TRANSACTION SCHEDULER** *schedname* **HAS BEEN ADDED TO THE APPC CONFIGURATION.**

Explanation: The specified logical unit (LU) was added to the Advanced Program-to-Program Communication (APPC) configuration and is ready for communication.

In the message text:

luname The LU that has been added.

schedname The scheduler that will use this LU.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system continues processing.

ATB051I LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* HAS BEEN DELETED FROM THE APPC CONFIGURATION.

Explanation: A logical unit (LU) has been deleted from the Advanced Program-to-Program Communication (APPC) configuration in response to a SET APPC=xx command.

In the message text:

luname The LU that has been deleted.

schedname The scheduler that was using this LU.

Source: APPC/MVS

Detecting Module: ATBLUEX

System Action: The system continues processing.

ATB052E LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* NOT ACTIVATED IN THE APPC CONFIGURATION. REASON CODE = *error-field-value*.

Explanation: A START APPC,SUB=MSTR,APPC=xx command or a SET APPC=xx command was issued to specify an APPCPMxx parmlib member that activates a logical unit (LU) in the Advanced Program-to-Program Communication (APPC) configuration. However, the system could not open the Virtual Telecommunications Access Method (VTAM) access method control block (ACB) for the specified LU. This LU is in pending state. Some of the return codes returned from OPEN can be a temporary condition which gets resolved. For example, this message may be encountered when APPC/MVS is activated, but VTAM is not active or completely initialized. To determine if the problem has been resolved, check the status of the LU by issuing the DISPLAY APPC,LU,ALL command. If the LU is now active then the condition has been resolved and no further actions are required.

In the message text:

luname The pending LU.

schedname The transaction scheduler that will use this LU.

error-field-value The value of the VTAM OPEN macro ERROR field (in hexadecimal).

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system continues processing.

Operator Response: Ask the system programmer to correct the problem. If the pending LU is not needed, enter the SET APPC command to delete it.

System Programmer Response: *error-field-value* is the value of the ERROR field returned by the VTAM OPEN macro. For more information, see ERROR field meanings for the OPEN macroinstruction in *OS/390 eNetwork Communications Server: SNA Programming*. When you correct the problem, the system will activate the LU.

ATB053I LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* NOT ADDED. IT ALREADY EXISTS IN THE APPC CONFIGURATION.

Explanation: The operator entered a SET APPC=xx command to specify an APPCPMxx parmlib member that adds a logical unit (LU) to the Advanced Program-to-Program Communication (APPC) configuration. However, the system could not make the change, because the specified LU already exists in the configuration.

In the message text:

luname The duplicate LU.

schedname The transaction scheduler that will use this LU.

Source: APPC/MVS

Detecting Module: ATBLUAD

System Action: The system continues processing.

Operator Response: Enter the DISPLAY APPC,LU,ALL command to verify the current APPC configuration.

ATB054I LOGICAL UNIT *luname* NOT DELETED. IT DOES NOT EXIST IN THE APPC CONFIGURATION.

Explanation: The operator entered a SET APPC=xx command to specify an APPCPMxx parmlib member that deletes a logical unit (LU) from the Advanced Program-to-Program Communication (APPC) configuration, but the system could not delete it because the LU does not exist.

In the message text:

luname The non-existent LU.

Source: APPC/MVS

Detecting Module: ATBLUDE

System Action: The system continues processing.

Operator Response: Enter the DISPLAY APPC command to verify the current APPC configuration.

ATB055I LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* HAS BEEN TERMINATED DUE TO SYSTEM ERROR. REASON CODE=*xx*.

Explanation: A logical unit (LU) has been deactivated due to a system error. No further work will be accepted for this LU.

In the message text:

luname The LU that has been deactivated.

schedname The scheduler that was using this LU.

xx An internal reason code.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system issues an SVC dump.

Operator Response: Enter the SET APPC command for a parmlib member that will reactivate this LU if necessary.

System Programmer Response: If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

ATB056I LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* NOT ADDED DUE TO A SYSTEM ERROR. REASON CODE = *reason-code*.

Explanation: An operator entered a SET APPC=xx command to change the applicable APPCPMxx parmlib member and to change the logical unit (LU) Advanced Program-to-Program Communication (APPC) configuration. The system could not add the LU to the configuration because of a system error.

In the message text:

luname The LU that could not be added to the APPC configuration.

schedname The scheduler that will use this LU.

reason-code The failure reason code.

Source: APPC/MVS

Detecting Module: ATBLUMM, ATBLUAD, ATBLUET

System Action: The system continues processing.

Operator Response: Try entering the SET command again to add the LU to the APPC configuration. If you still cannot add the LU, notify the system programmer.

System Programmer Response: If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the reason code issued by this message.

ATB057I LOGICAL UNIT *luname* NOT DELETED DUE TO A SYSTEM ERROR. REASON CODE = *reason-code*.

Explanation: The operator entered a SET APPC=xx command to specify an APPCPMxx parmlib member that deletes a logical unit (LU) from the Advanced Program-to-Program Communication (APPC) configuration, but the system could not delete the LU because of a system error.

In the message text:

luname The logical unit that could not be deleted.

reason-code The failure reason code.

Source: APPC/MVS

Detecting Module: ATBLUMM, ATBLUDE

System Action: The system continues processing.

Operator Response: Enter the SET command to delete the LU again. If you still cannot add the LU, notify the system programmer.

System Programmer Response: If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the reason code issued by this message.

ATB058I SESSION VALUES NOT DEFINED FOR LOGICAL UNIT *luname*.

Explanation: The operator entered a SET command to define session values, but the logical unit (LU) for which the session values are being defined is not in the Advanced Program-to-Program Communication (APPC) configuration.

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

In the message text:

luname The undefined LU.

Source: APPC/MVS

Detecting Module: ATBLUMA

System Action: The system continues processing.

Operator Response: Enter the DISPLAY APPC command to display the active LUs. Then enter the SET command to define session values for a defined LU.

System Programmer Response: Check the LMADD statement in the APPCPMxx parmlib member to make sure that the ACBNAME specified is already in the APPC configuration.

ATB059I SESSION VALUES NOT DELETED FOR LOGICAL UNIT *luname*.

Explanation: The system encountered an internal error while processing a SET LMDEL command. A specified connection is not in the Advanced Program-to-Program Communication (APPC) configuration.

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

In the message text:

luname The logical unit (LU) whose connection is not defined.

Source: APPC/MVS

Detecting Module: ATBLUMD

System Action: The system continues processing.

Operator Response: Enter the SET command to delete session values for a defined LU connection.

System Programmer Response: Check the LMDEL statement in the APPCPMxx parmlib member to make sure that a corresponding LMADD statement has been processed previously.

ATB060I SESSION VALUES NOT PROCESSED FOR LOGICAL UNIT *luname* DUE TO A SYSTEM ERROR.

Explanation: The system encountered an error while processing a SET LMADD or LMDEL command.

The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

In the message text:

luname The logical unit (LU) whose session values were not processed.

Source: APPC/MVS

Detecting Module: ATBLULM

System Action: The system continues processing.

Operator Response: Enter the SET command again to delete session values. If the session values still cannot be deleted, notify the system programmer.

System Programmer Response: This condition is probably caused by a system error. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB061I LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* WAS NOT COMPLETELY MODIFIED. REASON CODE = *reason-code*

Explanation: The system encountered an error while processing a SET APPC command to modify a logical unit (LU). The logical unit specified was not modified. The reason code indicates the type of error.

In the message text:

luname The specified LU.

schedname The name of the transaction scheduler that will use this LU. For a NOSCHED LU, the value is *NONE*.

reason-code One of the following (hex) failure reason codes:

Reason Code	Explanation
01	The user tried to dynamically change the scheduler name.
02	The user tried to dynamically change USERVAR data.
03	The user tried to dynamically change ALTLU data.
04	The user tried to dynamically change from SCHED to NOSCHED.
05	The user tried to dynamically change from NOSCHED to SCHED.
06	In the APPCPMxx parmlib member, a value other than SYSTEM was specified for the TPLEVEL keyword for a NOSCHED LU.
07	The user tried to dynamically change or add a generic resource name using the GRNAME keyword.
08	The user tried to dynamically change from NQN to NONQN.
09	The user tried to dynamically change from NONQN to NQN.

Source: APPC/MVS

System Action: The system continues processing.

Operator Response: Report this problem to the system programmer.

System Programmer Response: To modify the LU, use the SET APPC command to first delete the LU and then add it again with the new attribute.

ATB062I LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* HAS BEEN TERMINATED DUE TO ALTERNATE APPLICATION TAKEOVER.

Explanation: An application outside of Advanced Program-to-Program Communication (APPC) tried to open an access method control block (ACB) that was originally opened by APPC. This causes the system to close the logical unit (LU) associated with the ACB.

The fields in the message text are:

luname The name of the logical unit that the system closed.

schedname The name of the transaction scheduler that was using this logical unit.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system continues processing.

Operator Response: Notify the system programmer. Enter the SET APPC command to re-activate this logical unit if necessary.

System Programmer Response: This problem may be due to a security violation. Only authorized programs defined to RACF can open an ACB that was originally opened by APPC.

ATB063I PSTIMER PARAMETER REQUIRES VTAM PERSISTENT SESSIONS SUPPORT.

Explanation: In an Advanced Program-to-Program Communication (APPC) address space, the PSTIMER keyword on an LUADD statement requested that persistent sessions be used for a logical unit. However, the VTAM level available on the system does not support persistent sessions. VTAM 3.4 or higher is required for persistent sessions. The system ignores the request.

Source: APPC/MVS

Detecting Module: ATBLUAD

ATBLUPR

System Action: The system continues processing.

ATB064I LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER NOT ACTIVE. REASON CODE=*reason-code*.

Explanation: A logical unit is not functioning properly. The reason code indicates the type of error.

In the message text:

luname The name of the logical unit that is not active.

reason-code The reason code explaining the error is the following:

01	The level of VTAM in the system does not support cross-memory applications program interface (API) functions.
02	The APPL name does not match the ACB name for the logical unit.
03	The VTAM APPL definition statement must specify *both* SYNCLVL=SYNCPT and ATNLOSS=ALL, to enable the LU for protected conversations support.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The LU is placed in pending state. APPC/MVS continues processing.

Operator Response: Notify the system programmer.

System Programmer Response: Depending on the reason code, do one of the following:

- For reason code X'01', make sure that VTAM/ESA 3.3+SPE, or a later release of VTAM, is installed on your system.
- For reason code X'02', you must make sure that the ACB name and the APPL name for the logical unit are the same for APPC to function properly. Specify the same name for the logical unit in the following places:
  - Specify the ACB name on the LUADD parmlib statement
  - Specify the APPL name on the APPL statement in SYS1.VTAMLIST.
- For reason code X'03', make sure that the APPL definition statement contains the appropriate value for the SYNCLVL keyword. The SYNCLVL keyword value should be SYNCPT only if you want the LU to be enabled for protected conversations support; in this case, you must specify ATNLOSS=ALL on the APPL statement as well.

ATB065I GRNAME PARAMETER FOR LOGICAL UNIT *luname* IS IGNORED. APPC/MVS GENERIC RESOURCE SUPPORT REQUIRES VTAM V4R4.

Explanation: An LUADD statement in an APPCPMxx parmlib member specified the GRNAME keyword, which requests that the logical unit (LU) be registered with VTAM as a generic resource, with the specified generic resource name. APPC/MVS requires VTAM Version 4 Release 4 or higher for generic resource support, but the VTAM level on this system is not VTAM V4R4 or higher.

In the message text:

luname The name of the logical unit that APPC/MVS is activating.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system ignores the GRNAME parameter, and continues to activate the LU without the generic resource name, and without registering the LU with VTAM as a member of the generic resource group.

Operator Response: Notify the system programmer.

Application Programmer Response: If you want to define APPC/MVS LUs as VTAM generic resources:

1. Install VTAM V4R4.
2. Use the SET APPC command to delete the LU.
3. Use the SET APPC command again to add the LU with a generic resource name.

Otherwise, no action is necessary.

ATB066I LOGICAL UNIT *luname* NOT ACTIVATED. FAILURE IN REGISTERING LOGICAL UNIT WITH GENERIC RESOURCE NAME *grname*. VTAM RETURN CODE:*vtam-return-code*, FDB2:*fdb2*

Explanation: An LUADD statement in an APPCPMxx parmlib member specified the GRNAME keyword, which requests that the logical unit (LU) be registered with VTAM as a generic resource, with the specified generic resource name. When APPC/MVS attempted to register the LU with VTAM, VTAM rejected the request.

In the message text:

luname The name of the logical unit that APPC/MVS was attempting to activate.

grname The generic resource name that APPC/MVS was attempting to associate with the logical unit. This is the value that was specified in the APPCPMxx parmlib member.

vtam-return-code VTAM feedback information (in hexadecimal) that indicates the recovery action return code.

fdb2 VTAM feedback information (in hexadecimal) that indicates the specific error return code.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: APPC/MVS deletes the LU. The system continues processing.

Operator Response: Notify the system programmer. At the request of the system programmer, enter the SET APPC command to add the logical unit.

System Programmer Response: Refer to the information about fields RTNCD and FDB2 in *OS/390 eNetwork Communications Server: SNA Programmers LU 6.2 Guide* to determine the meaning of the *vtam-return-code* and *fdb2* values and the actions necessary to correct the problem.

When the problem has been corrected, ask the operator to enter a SET APPC command to process the parmlib member.

ATB067I LOGICAL UNIT *luname* NOT ACTIVATED. FAILURE IN REGISTERING LOGICAL UNIT WITH GENERIC RESOURCE NAME *grname*. VTAM RETURN CODE:*vtam-return-code*, FDB2:*fdb2*

Explanation: An LUADD statement in an APPCPMxx parmlib member specified the GRNAME keyword, which requests that the logical unit (LU) be registered with VTAM as a generic resource, with the specified generic resource name. When APPC/MVS attempted to register the LU with VTAM, VTAM rejected the request.

In the message text:

luname The name of the logical unit that APPC/MVS was attempting to activate.

grname The generic resource name that APPC/MVS was attempting to associate with the logical unit. This is the value that was specified in the APPCPMxx parmlib member.

vtam-return-code VTAM feedback information (in hexadecimal) that indicates the recovery action return code.

fdb2 VTAM feedback information (in hexadecimal) that indicates the specific error return code.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: APPC/MVS deletes the LU. A dump is taken. The system continues processing.

Operator Response: Notify the system programmer. At the request of the system programmer, enter the SET APPC command to add the logical unit.

System Programmer Response: Refer to the information about fields RTNCD and FDB2 in *OS/390 eNetwork Communications Server: SNA Programmers LU 6.2 Guide* to determine the meaning of the *vtam-return-code* and *fdb2* values and the actions necessary to correct the problem.

When the problem has been corrected, ask the operator to enter a SET APPC command to process the parmlib member.

ATB068I NQN PARAMETER FOR LOGICAL UNIT *luname* IS IGNORED. APPC/MVS NETWORK-QUALIFIED NAME SUPPORT REQUIRES VTAM V4R4.

Explanation: The NQN keyword on an LUADD statement for the specified logical unit requested that the LU be defined as capable of supporting network-qualified names. APPC/MVS requires VTAM Version 4 Release 4 or higher for network-qualified name support, but the VTAM level on this system is not VTAM V4R4 or higher.

In the message text:

luname The name of the logical unit that APPC/MVS is activating.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system ignores the NQN parameter, and continues to activate the LU without the ability to handle network-qualified names.

Operator Response: Notify the system programmer.

Application Programmer Response: If you want to define APPC/MVS LUs as capable of handling network-qualified names, IBM recommends that you do the following:

1. Install VTAM V4R4.
2. Use the SET APPC command to delete the LU.
3. Use the SET APPC command again to add the LU with NQN capability.

If you do not follow these steps, the LU might be able to handle outbound Allocate requests that use network-qualified names to identify partner LUs, but the results might be unpredictable.

ATB069I PROTECTED CONVERSATIONS FOR LOGICAL UNIT *luname* IS NOT AVAILABLE. APPC/MVS PROTECTED CONVERSATIONS SUPPORT REQUIRES VTAM V4R4.

Explanation: The VTAM APPL statement definition for this APPC/MVS LU specified SYNCLVL=SYNCPT and ATNLOSS=ALL, but the VTAM level on this system is not VTAM Version 4 Release 4 or higher. APPC/MVS requires VTAM V4R4 or higher for LUs to process protected conversations (conversations with a synchronization level of syncpt).

In the message text:

luname The name of the logical unit that APPC/MVS is activating.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system ignores the values for the SYNCLVL and ATNLOSS parameters and continues to activate the LU. The LU can process only conversations with a synchronization level of none or confirm.

Operator Response: Notify the system programmer.

Application Programmer Response: If you want to define APPC/MVS LUs to support protected conversations, IBM recommends that you do the following:

1. Install VTAM V4R4.
2. Use the SET APPC command to delete the LU.
3. Use the SET APPC command again to activate the LU with syncpoint capability.

ATB070I LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER schedname IS TERMINATING DUE TO XCF NOTIFICATION FAILURE. APPC HAS RECEIVED RETURN CODE=*xxxxxxxx*, REASON CODE=*yyyyyyyy* FROM THE *servname* SERVICE.

Explanation: APPC was attempting to send the status of the LU to the members of the APPC/MVS group. This attempt has failed due to a failure of an XCF macro. The return and reason codes from the specified XCF macro are supplied in the message.

In the message text:

xxxxxxxx is the return code and

yyyyyyyy is the reason code from the specified XCF macro.

servname is the failing XCF service.

Source: APPC/MVS

Detecting Module: ATBINSM

System Action: The LU is deleted from the APPC configuration.

Operator Response: Notify the system programmer. At the request of the system programmer, reactivate the LU by performing a SET APPC=xx command.

System Programmer Response: Determine the reason for the XCF failure. The service return and reason codes explain the error. For the description of the return and reason codes, See *OS/390 MVS Programming: Sysplex Services Reference*. Correct the problem. Reactivate the LU by performing a SET APPC=xx command.

ATB071I PERSIST PARAMETER ON LUDEL FOR LOGICAL UNIT *luname* IS IGNORED. THE LU WAS NOT ENABLED FOR PERSISTENT SESSIONS.

Explanation: Explanation: The PERSIST keyword on an LUDEL statement for the specified logical unit requested that APPC/MVS should not deactivate any persistent sessions between the LU and its partners. However, the value of the PSTIMER keyword on the LUADD for this LU was NONE at the time of the LUDEL, meaning that the LU was not enabled for persistent sessions.

In the message text:

luname The name of the logical unit that APPC/MVS is deactivating.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system ignores the PERSIST parameter and continues to deactivate the LU. When the LU is terminated, no sessions between the LU and its partners will be active.

Operator Response: Notify the system programmer.

Application Programmer Response: If you want to keep sessions active after an LUDEL has been performed for an LU, IBM recommends that you do the following:

- Enable the LU to support persistent sessions. For more information on persistent sessions, see *OS/390 MVS Planning: APPC/MVS Management*. For details on the PSTIMER keyword, see *OS/390 MVS Initialization and Tuning Reference*.
- Use the SET APPC command to delete the LU, specifying the PERSIST keyword.

ATB075I APPC COMPONENT TRACE IS UNAVAILABLE. REASON= *xxxxxxxx.*

Explanation: Due to errors in the Advanced Program-to-Program Communication (APPC) component trace initialization process, APPC component trace is unavailable until the next time APPC is started.

In the message text:

xxxxxxxx The failure reason code.

Source: APPC/MVS

Detecting Module: ATBCTIT, ATBCTCL

System Action: APPC operates without component tracing.

Operator Response: Report this message to the system programmer.

System Programmer Response: An internal error occurred. If you need to activate APPC component tracing, stop and restart APPC and then enter the APPC component trace command.

If the problem recurs, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB076I *option* **IS NOT A VALID TRACE OPTION.**

Explanation: The operator entered an incorrect APPC component trace option.

In the message text:

option The incorrect trace option is a string of up to ten characters.

Source: APPC/MVS

Detecting Module: ATBCTSM

System Action: The system does not start APPC component trace.

Operator Response: Restart the trace with valid options. See *OS/390 MVS Diagnosis: Reference* for more information.

ATB077I APPC COMPONENT TRACE CANNOT START YET.

Explanation: The operator entered the TRACE CT command to start APPC component tracing, but the system cannot start the trace because a previous trace is still in progress.

Source: APPC/MVS

Detecting Module: ATBCTSM

System Action: The system issues a message to notify the operator when the previous trace dump has completed.

Operator Response: Wait for the previous APPC component trace to complete, and then restart the trace.

ATB078I THE DUMP FOR APPC COMPONENT TRACE FAILED. REASON=*xxxxxxxx***.**

Explanation: Advanced Program-to-Program Communication (APPC) component trace encountered an error and ended before the trace data was dumped.

In the message text:

xxxxxxxx The failure reason code, which is one of the following:

Reason Code	Explanation
61000001	The SDUMPX macro returns a zero return code, but the asynchronous part of the dump failed.
61000002	The SDUMPX macro returns a nonzero return code.

Source: APPC/MVS

Detecting Module: ATBCTCL

System Action: APPC component trace processing ends. The system issues message ATB178I

Operator Response: Report this message to the system programmer.

System Programmer Response: See message ATB178I, which is issued to hard copy.

ATB079I APPC COMPONENT TRACE START OR STOP FAILED. REASON= *xxxxxxxx***.**

Explanation: Advanced Program-to-Program Communication (APPC) component trace failed while processing a TRACE CT command to turn tracing on or off.

In the message text:

xxxxxxxx The failure reason code.

Source: APPC/MVS

Detecting Module: ATBCTSM

System Action: The system ends APPC component tracing. Some trace data may be lost.

Operator Response: Report this message to the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB080I SYNTAX ERROR WITH THE OPTION USERID.

Explanation: The system encountered a syntax error in the tracing options specified for Advanced Program-to-Program Communication (APPC) component tracing. The syntax errors follow the USERID option.

Detecting Module: ATBCTSM

System Action: The system does not start APPC component trace.

System Programmer Response: Correct the options on either the TRACE CT command or in the parmlib member and start the trace again.

ATB082I A USERID SPECIFIED IS NOT VALID.

Explanation: The system encountered a syntax error in the tracing options specified for Advanced Program-to-Program Communication (APPC) component tracing. A string found after the USERID option and before the closing right parenthesis is not valid. It contains either more than eight characters or unacceptable characters.

Source: APPC/MVS

Detecting Module: ATBCTSM

System Action: The system does not start APPC component trace.

System Programmer Response: Correct the options on either the TRACE CT command or in the parmlib member and start the trace again.

ATB083I THE NUMBER OF USERIDS SPECIFIED EXCEEDS THE MAXIMUM OF 9.

Explanation: The system encountered a syntax error in the tracing options specified for Advanced Program-to-Program Communication (APPC) component tracing. The number of strings specified on the USERID option exceeded the maximum of nine.

Source: APPC/MVS

Detecting Module: ATBCTSM

System Action: The system does not start APPC component trace.

System Programmer Response: Correct the options on either the TRACE CT command or in the parmlib member and start the trace again.

ATB100I *hh.mm.ss* **APPC DISPLAY [***id***]**

Explanation: In the message, the following appears:

```
ALLOCATE QUEUES              SERVERS             QUEUED ALLOCATES
ttttt                        sssss               qqqqq

[STPN=stpname|¬X'hh'ccc
LLUN=luname     PLUN=pluname     USERID=userid
PROFILE=profile     REGTIME=mm/dd/yyyy hh:mm:ss     QUEUED=qqqqq
OLDEST=tttttttt     LAST RCVD=tttttttt     TOT ALLOCS=nnnnnnnn
SERVERS=sssss     KEEP TIME=tttt     TIME LEFT=tttt
[ ASNAME=asname
ASID=asid     REGTIME=mm/dd/yyyy hh:mm:ss     TOT RCVD=nnnnnnnn
RCVA ISS=hh:mm:ss     RCVA RET=hh:mm:ss]]
```

The operator entered the DISPLAY APPC,SERVER command to display information about allocate queues and their servers.

The first three lines of the message always appear.

In the first three lines of the message text:

hh.mm.ss The hour, minute, and second at which the system processed the DISPLAY command.

id A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on printer consoles or displayed inline on a console. This identifier does not appear when the display appears in a display area on a console.

nnnnn The number of allocate queues. This number is equal to the total number of unique Register_for_Allocate calls that are currently in effect.

sssss The total number of APPC/MVS servers. These servers are address spaces that are currently registered to serve inbound allocate requests.

qqqqq The total number of inbound allocates currently queued on allocate queues.

If the command includes the LIST parameter, lines 4 through 8 appear for each allocate queue that is currently active, or that is selected by optional keyword parameters.

In lines 4 through 8 of the message text:

STPN=*stpname***|¬X'hh'***ccc* The served TP name. It is 1 to 64 characters long.

stpname The served TP name. *stpname* is a string 1 to 64 characters long.

¬**X'***hh***'***ccc* The system network architecture (SNA) service TP name:

hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable in non-hexadecimal form.

ccc A character string, with a maximum length of 3.

LLUN=*luname* The name of the logical unit (LU) at which the APPC/MVS server resides.

PLUN=*pluname* The name of the LU from which the allocate request originated. A value of * indicates that allocate requests from any partner LU are accepted.

USERID=*userid* The userid that flowed in with the allocate request. A value of * indicates that allocate requests from any userid are accepted.

PROFILE=*profile* The name of the security profile from which inbound allocates are to be accepted. A value of * indicates that allocate requests with any profile are to be accepted.

REGTIME=*mm/dd/yyyy hh:mm:ss* The time at which the Register_for_Allocates call that created the allocate queue was processed. *mm/dd/yyyy* represents the month, day, and year. *hh:mm:ss* represents the hour, minute, and second, based on the time of day (TOD) clock.

QUEUED=*nnnnn* The number of inbound allocates currently residing on the queue.

OLDEST=*nnnnnnnn* The amount of time that the oldest inbound allocate has been on the allocate queue. Depending on the amount of time, *tttttttt* has one of the following formats:

sss.ttt **S** The time is less than 1000 seconds.

hh.mm.ss The time is at least 1000 seconds, but less than 100 hours.

hhhhh.mm The time is at least 100 hours.

************ The time is greater than 99999 hours.

NONE There are no allocate requests on the allocate queue.

In the variable text:

ttt The number of milliseconds.

sss or *ss* The number of seconds.

mm The number of minutes.

hh or *hhhhh* The number of hours.

LAST RCVD=*tttttttt* The amount of time since an inbound allocate was last received (and thus removed from the allocate queue) through the Receive_Allocate service. Depending on the amount of time, *tttttttt* has one of the following formats:

sss.ttt **S** The time is less than 1000 seconds.

hh.mm.ss The time is at least 1000 seconds, but less than 100 hours.

hhhhh.mm The time is at least 100 hours.

************ The time is greater than 99999 hours.

NONE No inbound allocates have been received from the queue.

In the variable text:

ttt The number of milliseconds.

sss or *ss* The number of seconds.

mm The number of minutes.

hh or *hhhhh* The number of hours.

TOT ALLOCS=*nnnnnnnn* This is the number of allocate requests waiting to be received from the allocate queue, plus the number of allocate requests that have already been received.

SERVERS=*nnnnn* The number of servers processing requests on the allocate queue.

KEEP TIME=*nnnn.* The amount of time, in seconds, that the allocate queue is to remain active after all of its servers unregister (as specified through the Set_Allocate_Queue_Attributes service).

TIME LEFT=*nnnn.* The amount of time, in seconds, remaining before the allocate queue will be purged. This field is only valid when there are no servers processing the served TP (that is, SERVERS=0). When SERVERS does not equal zero, TIME LEFT contains a value of *N/A*.

If the DISPLAY APPC,SERVER command includes the ALL parameter, the following lines appear in the message text:

- One occurrence of lines 4 through 8 for all active allocate queues, or a subset of active allocate queues that is selected by optional keyword parameters.
- For each queue:
  - One occurrence of lines 9 through 11 for each address space serving the queue.

In lines 9 through 11 of the message text:

ASNAME=*asname* The address space name of the server. This field will contain ***UNKNOWN*** if the address space name cannot be determined.

ASID=*asid* The address space identifier (ASID) of the server. This field is set to ***UNKNOWN*** if the ASID cannot be determined.

REGTIME=*mm/dd/yyyy hh:mm:ss* The time at which the last Register_For_Allocates service was processed for this server. *mm/dd/yyyy* represents the month, day, and year. *hh:mm:ss* represents the hour, minute, and second, based on the time of day (TOD) clock.

TOT RCVD=*nnnnnnnn* Total number of allocates that the server has received from the allocate queue during the current IPL.

RCVA ISS=*hh:mm:ss* The time (hour, minute, and second) at which the server last issued the Receive_Allocate service. This time is based on the time of day (TOD) clock. A value of *NONE* indicates that the server has not yet issued the Receive_Allocate service.

RCVA RET=*hh:mm:ss* The time (hour, minute, and second) at which the Receive_Allocate service last returned to the caller (after attempting to return an allocate request). This time is based on the time of day (TOD) clock.

The Receive_Allocate call might or might not have returned an allocate request to the caller. A value of *NONE* indicates that no allocate requests have yet been returned.

Source: APPC/MVS

System Action: The system continues processing.

ATB101I *hh.mm.ss* **APPC DISPLAY [***id***]**

Explanation: In the message, the following appears:

```
ACTIVE LU'S     OUTBOUND LU'S     PENDING LU'S     TERMINATING LU'S
aaaa       ooooo       ppppp      ttttt
SIDEINFO=side_dsetname
[LLUN=unitname      SCHED=schdname     BASE=xxx
  STATUS=stat   PARTNERS=nnnn     TPLEVEL=tplvel
  TPDATA=dsetname
[ PLUN=luname
```

The operator entered a DISPLAY APPC,LU command to display information about local and partner LUs.

The first four lines of the message always appear.

In the first four lines of the message text:

hh.mm.ss The hour, minute, and second at which the system processed the DISPLAY command. **00.00.00** appears in this field if the time-of-day (TOD) clock is not working.

id A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display is presented in a display area on a display console.

ACTIVE LU'S *nnnn* The number of APPC/MVS logical units (LU) with ACTIVE status. An LU is active when it is fully initialized and capable of processing both inbound and outbound requests.

OUTBOUND LU'S *nnnnn* The number of APPC/MVS LUs with OUTBOUND status. An LU is OUTBOUND when the transaction scheduler that owns the LU halts all transaction requests to the LU.

PENDING LU'S *nnnnn* The number of APPC/MVS LUs with PENDING status. An LU is pending when the system is initializing the LU.

TERMINATING LU'S *nnnnn* The number of APPC/MVS LUs with TERMINATING status. A logical unit is ending when a SET command removes it from the system and the system allows active conversations on the LUs sessions to complete.

SIDEINFO=*side_dsetname* The name of the currently active side information file. The side information file is a Virtual Storage Access Method (VSAM) key sequenced data set containing the side information. If no side information file was specified in the APPCPM*xx* parmlib member this value will be *NONE*.

Lines 5-7 of the message text:

Lines 5-7 appear in the message text if the DISPLAY APPC,LU command includes the LIST parameter. Lines 5-7 are repeated for each local LU that is defined to APPC/MVS or selected by optional keyword parameters.

LLUN=*luname* The local logical unit name.

SCHED=*schdname* The name of the APPC/MVS transaction scheduler that schedules transactions for this LU. It is specified on the SCHED keyword in the current parmlib configuration. If there is no scheduler associated with the LU (because the NOSCHED option was specified for the LU in the APPCPMxx parmlib member), this value is *NONE*.

BASE=*xxx* *xxx* is one of the following:

YES	The logical unit is a base logical unit.
NO	The logical unit is not the base logical unit.

STATUS=*stat* The status of the logical unit, which is one of the following:

ACTIVE	The logical unit is active.
OUTBOUND	The logical unit is outbound.
PENDING	The logical unit is pending.
TERMINATING	The logical unit is ending.

PARTNERS=*nnnnn* The number of LUs for which session limits are established with LU *luname*. The maximum value is 99999.

TPLEVEL=*tplvel* The transaction program (TP) level specified in parmlib for this LU, which is one of the following:

SYSTEM	The TP is available to all users defined to LU *unitname*. This is the default level.
GROUP	The TP is available to a group defined to LU *unitname*.
USER	The TP is available to an individual user defined to LU *unitname*.

TPDATA=*dsetname* A 1 to 44 character name for a data set that contains the TP profile for LU *luname*.

Line 8 of the message text:

Line 8 appears if the DISPLAY APPC,LU command includes the ALL parameter. Line 8 appears once for either:

- Each partner LU for which session limits are established with LU *unitname*
- The partner LUs specified on the PLUN keyword

PLUN=*luname* The partner LU name.

Source: APPC/MVS

System Action: The system continues processing.

ATB102I *hh.mm.ss* **APPC DISPLAY [***id***]**

Explanation: In the message, the following appears:

```
LOCAL TP'S     INBOUND CONVERSATIONS    OUTBOUND CONVERSATIONS
ttttt            ccccc            ooooo
[LTPN=tpname|X'hh'ccc | STPN=tpname|¬X'hh'ccc
LLUN=luname    WUID=workid    CONVERSATIONS=mmmmm    ASID=asid
SCHED=schdname    ASNAME=adspname    TPID=tpid]
[PTPN=tpname|X'hh'ccc
PLUN=luname    USERID=userid    DIRECTION=dir
VERBS=verbs    IT=nnnnnnnn    LCID=lcid
MODE=mode    VTAMCID=cid]
```

The operator entered the DISPLAY APPC,TP command to display information about local transaction programs (TPs) and their conversations.

The first three lines of the message always appear.

In the first three lines of the message text:

hh.mm.ss The hour, minute, and second at which the system processed the DISPLAY command. **00.00.00** appears in this field if the time of day (TOD) clock is not working.

id A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display appears in a display area on a display console.

LOCAL TP'S *nnnnn* The number of APPC/MVS TPs that the system is currently processing, or that were selected by optional keyword parameters. This value includes the number of TPs that are being processed by APPC/MVS servers (served TPs) and TPs that have been scheduled by APPC/MVS transaction schedulers. This later group of TPs is called scheduled TPs.

INBOUND CONVERSATIONS *nnnnn* The number of inbound conversations that are currently allocated, or that were selected by optional keyword parameters.

OUTBOUND CONVERSATIONS *nnnnn* The number of outbound conversations currently allocated, or that are selected by optional keyword parameters.

Note: If the partner TP is another local APPC/MVS TP, the conversation is considered local. Unless one or both ends of a local conversation are suppressed from the display by keyword filter parameters, the system displays all local conversations twice, as follows:

- The TP that did the allocate is shown as the local TP. The allocated TP is shown as the partner.
- The allocated TP is shown as the local TP. The TP that did the allocate is shown as the partner.

If the command includes the LIST parameter, lines 4 through 6 appear for each local TP that is currently active, or a subset of these TPs, depending on whether the operator specified one or more optional filter keyword parameters on the command.

The TPs are grouped by address space, with lines 4 through 6 repeated for each local TP running in an address space. Information about TPs processed by APPC/MVS servers (served TPs) is separate from information about TPs scheduled by an APPC/MVS transaction scheduler.

Lines 4-6 appear first for a local scheduled TP, if one is running in the address space. The LTPN= variable indicates local scheduled TPs. Lines 4 through 6 appear for each served TP running in an address space, if any. The STPN= variable indicates local served TPs.

An address space can contain, at most, one local inbound scheduled TP, together with TP. An address space can, however, contain any number of served local TPs.

In lines 4 through 6 of the message text:

LTPN=*tpname***|X'***hh***'***ccc*** or STPN=***tpname***|X'***hh***'***ccc*** In the message text:

tpname The local TP name. If the TP is scheduled by a transaction scheduler, LTPN= precedes the name. If the TP is served by an APPC/MVS server, STPN= precedes the name. The TP name is 1 to 64 characters long.

¬**X'***hh***'***ccc* The systems network architecture (SNA) service TP name. In the variable text:

hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.

ccc A character string, with a maximum length of 3.

For outbound conversations, ***UNKNOWN*** appears in this field.

LLUN=*luname* The logical unit (LU) name.

WUID=*workid* The work unit identifier, which the transaction scheduler assigns to a program instance using the Unit_of_Work_ID. The value in this field is ***UNKNOWN*** if:

- The transaction scheduler does not use the associate service
- The transaction scheduler does not use the Unit_of_Work_ID parameter on the associate service
- The TP is not scheduled by a transaction scheduler

CONVERSATIONS=*nnnnn* The number of conversations in which the TP is involved. The maximum value is 99999.

ASID=*asid* The address space identifier (ASID) to which the TP is associated.

SCHED=*schdname* The name of the transaction scheduler that scheduled the TP. It is the value of a SCHED keyword in the APPCPM*xx* parmlib member. If the TP is a batch job, started task, or TSO/E user, or if the TP is running under an LU that is not associated with a transaction scheduler (NOSCHED LU), ***NONE*** appears in this field.

ASNAME=*adspname* The name of the address space with which the TP is currently associated. If the local TP is running as a batch job, the job name appears in this field. If the local TP is running under TSO/E, the TSO/E userid appears in this field. If the local TP is running in a transaction initiator, a value from the TP profile appears in this field.

TPID=*tpid* The TP identifier. It is a 16-digit hexadecimal value. The field (including TPID=) does not appear for served TPs.

If the DISPLAY APPC,TP command includes the ALL parameter, the following lines appear in the message text:

- Lines 4 through 6
- One occurrence of lines 7 through 10 for each conversation in which the local transaction program is involved.

In lines 7 through 10 of the message text:

PTPN=*tpname***|X'***hh***'***ccc*** In the message text:

tpname The partner TP name. It is 1 to 64 characters long. For inbound conversations, ***UNKNOWN*** appears in this field.

¬**X'***hh***'***ccc* The systems network architecture (SNA) service TP name. In the variable text:

hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.

ccc A character string, with a maximum length of 3.

For inbound conversations, ***UNKNOWN*** appears in this field.

PLUN=*unitname* The partner LU name.

USERID=*userid* The userid that flowed into or out of APPC/MVS on an ALLOCATE request for this conversation. For an inbound conversation, it is the userid of the local system TP. For an outbound conversation, it is the userid of the partner TP. If a userid was not specified, ***NONE*** appears in this field.

DIRECTION=*dir* The direction of the conversation, which is one of the following:

INBOUND The conversation is inbound. It was allocated by the partner TP.

OUTBOUND The conversation is outbound. It was allocated by the local TP.

VERBS=*nnnnnnnn* The number of APPC callable services issued by the local TP on this conversation. The maximum value is 99999999.

IT=*nnnnnnnn* The amount of time that the local TP has been waiting for data or a confirmation from the partner TP. Depending on the amount of time, *nnnnnnnn* has one of the following formats:

sss.ttt **S** The time is less than 1000 seconds.

hh.mm.ss The time is at least 1000 seconds, but less than 100 hours.

hhhhh.mm The time is at least 100 hours.

************ The time is greater than 99999 hours.

NOTAVAIL The time-of-day (TOD) clock is not working

NONE The local TP is not waiting for data or a confirmation.

In the variable text:

ttt The number of milliseconds.

sss or *ss* The number of seconds.

mm The number of minutes.

hh or *hhhhh* The number of hours.

LCID=*lcid* The local conversation identifier. It is an 8-digit hexadecimal value. For a Virtual Telecommunications Access Method (VTAM) conversation, ***NONE*** appears in this field.

MODE=*modename* The mode used by the conversation.

VTAMCID=*cid* The VTAM conversation identifier. For a VTAM conversation, this provides the link between APPC and VTAM. For a local conversation, ***NONE*** appears in this field. It is an 8-digit hexadecimal value.

Source: APPC/MVS

  - One occurrence of lines 9 through 11 for each address space serving the queue.

In lines 9 through 11 of the message text:

ASNAME=*asname* The address space name of the server. This field will contain ***UNKNOWN*** if the address space name cannot be determined.

ASID=*asid* The address space identifier (ASID) of the server. This field is set to ***UNKNOWN*** if the ASID cannot be determined.

REGTIME=*mm/dd/yy hh:mm:ss* The time at which the last Register_For_Allocates service was processed for this server. *mm/dd/yy* represents the month, day, and year. *hh:mm:ss* represents the hour, minute, and second, based on the time of day (TOD) clock.

TOT RCVD=*nnnnnnnn* Total number of allocates that the server has received from the allocate queue during the current IPL.

RCVA ISS=*hh:mm:ss* The time (hour, minute, and second) at which the server last issued the Receive_Allocate service. This time is based on the time of day (TOD) clock. A value of *NONE* indicates that the server has not yet issued the Receive_Allocate service.

RCVA RET=*hh:mm:ss* The time (hour, minute, and second) at which the Receive_Allocate service last returned to the caller (after attempting to return an allocate request). This time is based on the time of day (TOD) clock.

The Receive_Allocate call might or might not have returned an allocate request to the caller. A value of *NONE* indicates that no allocate requests have yet been returned.

System Action: The system continues processing.

ATB104I *hh.mm.ss* **APPC DISPLAY [***id***]**

Explanation: In the message, the following appears:

```
APPC UR'S    EXPRESSIONS OF INTEREST
ttttt      eeeee
[URID=urid
EXPRESSION OF INTEREST COUNT=cnt    SYNC POINT IN PROG=sss
LUWID=luwid]
[LTPN=tpname|X'hh'ccc
PTPN=tpname|X'hh'ccc
CONV CORRELATOR=ccid
LLUN=luname    PLUN=pluname    DIRECTION=dir
RESYNC REQUIRED=rrr    IMPLIED FORGET=fff]
```

When the operator enters the DISPLAY APPC,UR command, this message displays information that APPC/MVS has about local units of recovery (URs) and APPC/MVS expressions of interest in these URs. The information is displayed with conversation information, such as local and partner LU names, protected LUWIDs, conversation correlators, and local and remote TP names.

The first three lines of the message always appear.

In the first three lines of the message text:

hh.mm.ss The hour, minute, and second at which the DISPLAY command was processed.

id A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display appears in a display area on a display console.

APPC UR'S *ttttt* The number of URs that have at least one expression of recoverable interest from APPC/MVS that meets all the specified optional selection parameters. *ttttt* is displayed as a decimal integer.

EXPRESSIONS OF INTEREST *eeeee* The number of expressions of recoverable interest from APPC/MVS that meet all the specified optional selection parameters. *eeeee* is displayed as a decimal integer.

If the command includes the LIST parameter, lines 4 through 6 appear for each UR included in the summary.

In lines 4 through 6 of the message text:

URID=*urid* The URID is the RRS unit of recovery identifier (in hexadecimal)

You can use this URID with the LUWID also displayed by this message to correlate information when using the RRS ISPF panels. For more information on the RRS ISPF panel interface, see *OS/390 MVS Programming: Resource Recovery*.

EXPRESSION OF INTEREST COUNT=*num* The number of APPC/MVS expressions of recoverable interest in this unit of recovery that meet all the specified optional selection parameters. *num* is displayed as a decimal integer.

SYNC POINT IN PROG=*sss sss* is one of the following:

YES A syncpoint verb (Commit or Backout) is in progress for the unit of recovery.

NO There is no syncpoint verb in progress for the unit of recovery.

LUWID=*luwid* The protected logical unit of work ID (LUWID) for this unit of recovery. You can use this LUWID with the URID also displayed by this message to correlate information when using the RRS ISPF panels. For more information on the RRS ISPF panel interface, see *OS/390 MVS Programming: Resource Recovery*.

If the DISPLAY APPC,UR command includes the ALL parameter, the following lines appear in the message text:

- One occurrence of lines 4 through 6, for each unit of recovery for which APPC/MVS has at least one expression of recoverable interest that meets all the specified optional selection parameters.
- One occurrence of lines 7 through 10, for each APPC/MVS expression of recoverable interest that meets all the specified optional selection parameters.

The expressions of interest are grouped together by unit of recovery.

In lines 7 through 11 of the message text:

LTPN=*tpname***|X'***hh***'***ccc* In the message text:

tpname The local TP name. It is 1 to 64 characters long. If there is no inbound conversation or the TP name cannot be determined, ***UNKNOWN*** appears in this field.

¬**X'***hh***'***ccc* The SNA service TP name. In the variable text:

hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable in non-hexadecimal form.

ccc A character string, with a maximum length of 3.

If there is no inbound conversation to the TP, ***UNKNOWN*** appears in this field.

PTPN=*tpname***|X'***hh***'***ccc* In the message text:

tpname The partner TP name. It is 1 to 64 characters long. For inbound conversations, ***UNKNOWN*** appears in this field.

X'*hh***'***ccc* The SNA service TP name. In the variable text:

hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable in non-hexadecimal form.

ccc A character string, with a maximum length of 3.

UNKNOWN appears in this field when either:

- The conversation is inbound, or
- The TP name cannot be determined

CONV CORRELATOR=*ccid* The conversation correlator of the conversation for which APPC expressed interest. *ccid* is displayed in character representation of hexadecimal digits.

Note: A conversation correlator is unique among all the conversation correlators created by a particular LU. All conversation correlators are created by the LU that initiates the conversation allocation.

LLUN=*luname* The 8-byte network LU name of the local LU. *luname* is displayed as character data.

PLUN=*pluname* The network-qualified name of the partner LU, if its network ID is known. *pluname* is displayed as character data.

DIRECTION=*dir* The direction of the conversation, which is one of the following:

INBOUND The conversation is inbound. It was allocated by the partner TP.

OUTBOUND The conversation is outbound. It was allocated by the local TP.

UNKNOWN The conversation direction is either not applicable or not available.

RESYNC REQUIRED=*rrr rrr* is one of the following:

YES Resynchronization is required for the unit of recovery because of a protected conversation failure. Resynchronization is required to achieve a state of consistency.

NO Resynchronization is not required for the unit of recovery.

IMPLIED FORGET=*fff fff* is one of the following:

YES Indicates an implied-forget condition. Before it can complete, the unit of recovery requires the receipt of a network flow as notification that the syncpoint initiator has received the last message about the expression of interest.

NO Indicates there is no implied-forget condition.

Source: APPC/MVS

Detecting Module: ATBCODP

System Action: The system continues processing.

ATB105I DISPLAY APPC SYNTAX ERROR. UNEXPECTED END OF COMMAND: *error*

Explanation: In the DISPLAY APPC command, the system found a blank space where operands were expected.

In the message text:

error The 20-character string preceding the blank space.

Source: APPC/MVS

Detecting Module: ATBCODI

System Action: The system does not run the command.

Operator Response: Remove any unnecessary blank spaces that are embedded in the text of the command. Enter the command again.

ATB106I DISPLAY APPC SYNTAX ERROR. INVALID PARAMETER: *error*

Explanation: In the DISPLAY APPC command, a parameter is not valid.

In the message text:

error A 20-character string starting with the parameter in error.

Source: APPC/MVS

Detecting Module: ATBCODI

System Action: The system rejects the command.

Operator Response: Enter the command again, using a valid parameter. See *OS/390 MVS Programming: Writing TPs for APPC/MVS* for a list of valid parameters.

ATB107I DISPLAY APPC SYNTAX ERROR. INVALID DELIMITER AFTER PARAMETER: *error*

Explanation: In the DISPLAY APPC command, the system found an incorrect delimiter. For the DISPLAY ASCH command, delimiters are commas and equal signs.

In the message text:

error A 20-character string starting with the parameter preceding the incorrect delimiter.

Source: APPC/MVS

Detecting Module: ATBCODI

System Action: The system does not run the command.

Operator Response: Remove or replace the incorrect delimiter. Enter the command again.

ATB108I DISPLAY APPC SYNTAX ERROR. DUPLICATE KEYWORD PARAMETER: *error*

Explanation: In the DISPLAY APPC command, the system found a duplicate keyword.

In the message text:

error A 20-character string starting with the second occurrence of the duplicate keyword parameter.

Source: APPC/MVS

Detecting Module: ATBCODI

System Action: The system rejects the command.

Operator Response: Remove the duplicate keyword. Enter the command again.

ATB109I DISPLAY APPC SYNTAX ERROR. INVALID KEYWORD VALUE: *error*

Explanation: In the DISPLAY APPC command, a keyword value was incorrect.

In the message text:

error A 20-character string starting with the keyword that contains the incorrect value.

Source: APPC/MVS

Detecting Module: ATBCODI

System Action: The system rejects the command.

Operator Response: Enter the command again, specifying a correct keyword value.

ATB110I DISPLAY APPC UNAVAILABLE. APPC IS NOT ACTIVE.

Explanation: The system cannot display the output requested by a DISPLAY APPC command because Advanced Program-to-Program Communication (APPC) is not active.

Source: APPC/MVS

Detecting Module: ATBCODP

System Action: The system continues processing.

Operator Response: If APPC is required, enter a START APPC command to start APPC. Then, after the system issues message ATB007I to indicate that APPC is active, enter the DISPLAY APPC command again.

ATB111I DISPLAY APPC UNAVAILABLE. APPC IS STARTING.

Explanation: The system cannot display the output requested by a DISPLAY APPC command because the system is initializing Advanced Program-to-Program Communication (APPC).

Source: APPC/MVS

Detecting Module: ATBCODP

System Action: The system continues APPC initialization. The system issues message ATB007I when APPC is initialized.

Operator Response: Wait until the system issues ATB007I. Then enter the DISPLAY APPC command again.

ATB112I DISPLAY APPC UNAVAILABLE. APPC IS TERMINATING AND WILL AUTOMATICALLY RESTART.

Explanation: Because an internal error occurred in Advanced Program-to-Program Communication (APPC), APPC is ending and will automatically begin re-initialization. The system cannot display the output requested by a DISPLAY APPC command.

Source: APPC/MVS

Detecting Module: ATBCODP

System Action: The system continues initializing APPC. The system issues message ATB007I when APPC is initialized.

Operator Response: Wait until the system issues message ATB007I. Then enter the DISPLAY APPC command again.

ATB113I DISPLAY APPC UNAVAILABLE. APPC IS TERMINATING.

Explanation: Advanced Program-to-Program Communication (APPC) is ending because one of the following occurred:

- The operator entered the CANCEL or FORCE command.
- An internal error occurred in APPC.

The system cannot display the output requested by a DISPLAY APPC command.

Source: APPC/MVS

Detecting Module: ATBCODP

System Action: APPC end processing continues. The system issues message ATB002I when end processing is complete.

Operator Response: Allow APPC to end. Then, if desired, restart APPC by entering a START APPC command.

ATB121I *hh.mm.ss* **APPC DISPLAY [***id***]**

Explanation: In the message, the following appears:

```
ACTIVE LU'S    OUTBOUND LU'S    PENDING LU'S    TERMINATING LU'S
aaaa    ooooo    ppppp    ttttt
SIDEINFO=side_dsetname
[LLUN=luname    SCHED=schdname    BASE=xxx    NQN=xxx
    STATUS=stat    PARTNERS=nnnnn    TPLEVEL=tplvel    SYNCPT=sss
    GRNAME=grname    RMNAME=rmname
    TPDATA=dsetname
    [ PLUN=pluname    ]]
```

When the operator enters a DISPLAY APPC,LU command, this message displays information about local and partner LUs.

The first four lines of the message always appear.

In the first four lines of the message text:

hh.mm.ss The hour, minute, and second at which the display command was processed.

id A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display is presented in a display area on a display console.

ACTIVE LU'S *aaaa* The number of APPC/MVS logical units (LU) with ACTIVE status. An LU is active when it is fully initialized and capable of processing both inbound and outbound requests.

OUTBOUND LU'S *ooooo* The number of APPC/MVS LUs with OUTBOUND status. An LU is OUTBOUND when the transaction scheduler that owns the LU halts all transaction requests to the LU.

PENDING LU'S *ppppp* The number of APPC/MVS LUs with PENDING status. An LU is pending when the system is initializing the LU.

TERMINATING LU'S *ttttt* The number of APPC/MVS LUs with TERMINATING status. A logical unit is ending when a SET command removes it from the system and the system allows active conversations on the LUs sessions to complete.

SIDEINFO=*side_dsetname* The name of the currently active side information file. The side information file is a Virtual Storage Access Method (VSAM) key sequenced data set containing the side information. If no side information file was specified in the APPCPM*xx* parmlib member this value will be *NONE*.

Lines 5-8 of the message text:

Lines 5-8 appear in the message text if the DISPLAY APPC,LU command includes the LIST parameter. Lines 5-8 are repeated for each local LU that is defined to APPC/MVS or selected by optional keyword parameters.

LLUN=*luname* The local logical unit name.

SCHED=*schdname* The name of the APPC/MVS transaction scheduler that schedules transactions for this LU. It is specified on the SCHED keyword in the current parmlib configuration. If there is no scheduler associated with the LU (that is, the NOSCHED option is specified in the parmlib configuration), this value will be *NONE*.

BASE=*xxx* *xxx* is one of the following:

- **YES** The logical unit is a base logical unit.
- **NO** The logical unit is not the base logical unit.

NQN=*xxx* *xxx* is one of the following:

- **YES** Any Allocate request originating from this LU may specify a network-qualified partner LU name where the LU name does not have to be unique across interconnected networks.
- **NO** Any Allocate request originating from this LU must specify a partner LU name (network-qualified or not) where the LU name must be unique across interconnected networks.

STATUS=*stat* The status of the logical unit, which is one of the following:

- **ACTIVE** The logical unit is active.
- **OUTBOUND** The logical unit is outbound.
- **PENDING** The logical unit is pending.
- **TERMINATING** The logical unit is ending.

PARTNERS=*nnnnn* The number of LUs with at least one session bound to LU *luname*. The maximum value is 99999.

TPLEVEL=*tplvel* The transaction program (TP) level specified in parmlib for this LU, which is one of the following:

- **SYSTEM** The TP is available to all users defined to LU *luname*. This is the default level.
- **GROUP** The TP is available to a group defined to LU *luname*.
- **USER** The TP is available to an individual user defined to LU *luname*.

SYNCPT=*sss* Specifies whether the local LU's resource manager exits are set with RRS and the LU is capable of supporting protected conversations (that is, conversations

with a synchronization level of Syncpt). *sss* is one of the following:

YES The local LU is registered with RRS and is capable of supporting protected conversations.

NO The local LU either is not registered with RRS at the current time, or is not capable of supporting protected conversations because of one of the following:

- The VTAM APPL definition for the local LU does not specify SYNCLVL=SYNCPT and ATNLOSS=ALL
- The status of the local LU is pending
- RRS is not active.
- An internal APPC/MVS error caused the local LU to become unregistered as a resource manager.

GRNAME=*grname grname* is the generic resource name with which the LU will register or has registered. The generic resource name identifies a set of LUs that provide the same function. Sessions initiated using a generic resource name are established with one of the LUs mapped to the generic resource name. This name is specified on the GRNAME parameter of the LUADD statement in the APPCPMxx parmlib member. If the GRNAME parameter was not specified in APPCPMxx, this value will be *NONE*.

RMNAME=*rmname* The APPC/MVS-generated resource manager name for the LU, if the LU is registered as a communications resource manager with RRS, and is capable of supporting protected conversations. If SYNCPT=NO appears in the display, this value will be *NONE*.

TPDATA=*dsetname* A 1 to 44 character name for a data set that contains the TP profile for LU *luname*.

Line 9 of the message text:

Line 9 appears if the DISPLAY APPC,LU command includes the ALL parameter. Line 9 appears once for either:

- Each partner LU with at least one session bound to LU *luname*
- The partner LUs specified on the PLUN keyword.

PLUN=*pluname* The partner LU name. This name is network-qualified if the network ID is known.

Source: APPC/MVS

Detecting Module: ATBCODP

System Action: The system continues processing.

ATB122I *hh.mm.ss* **APPC DISPLAY [***id***]**

Explanation: In the message, the following appears:

```
LOCAL TP'S     INBOUND CONVERSATIONS    OUTBOUND CONVERSATIONS
ttttt            ccccc                  ooooo
[LTPN=tpname|X'hh'ccc | STPN=tpname|¬X'hh'ccc
    LLUN=luname    WUID=workid    CONVERSATIONS=mm    ASID=asid
    SCHED=schednm    ASNAME=adspname    TPID=tp-id]
[PTPN=tpname|X'hh'ccc
    PLUN=luname
    PROTECTED=ppp    USERID=userid    DIRECTION=dir
    VERBS=verbs    IT=nnnnnnnn    LCID=lcid
    MODE=mode    VTAMCID=cid    SYNC POINT IN PROG=sss
    LUWID=luwid]
```

The operator entered the DISPLAY APPC,TP command to display information about local transaction programs (TPs) and their conversations.

The first three lines of the message always appear.

In the first three lines of the message text:

hh.mm.ss The hour, minute, and second at which the system processed the DISPLAY command. **00.00.00** appears in this field if the time of day (TOD) clock is not working.

id A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display appears in a display area on a display console.

LOCAL TP'S *nnnnn* The number of APPC/MVS TPs that the system is currently processing, or that were selected by optional keyword parameters. This value includes the number of TPs that are being processed by APPC/MVS servers (served TPs) and TPs that have been scheduled by APPC/MVS transaction schedulers. This later group of TPs is called scheduled TPs.

INBOUND CONVERSATIONS *nnnnn* The number of inbound conversations that are currently allocated, or that were selected by optional keyword parameters.

OUTBOUND CONVERSATIONS *nnnnn* The number of outbound conversations currently allocated, or that are selected by optional keyword parameters.

Note: If the partner TP is another local APPC/MVS TP, the conversation is considered local. Unless one or both ends of a local conversation are suppressed from the display by keyword filter parameters, the system displays all local conversations twice, as follows:

- The TP that did the allocate is shown as the local TP. The allocated TP is shown as the partner.
- The allocated TP is shown as the local TP. The TP that did the allocate is shown as the partner.

If the command includes the LIST parameter, lines 4 through 6 appear for each local TP that is currently active, or a subset of these TPs, depending on whether the operator specified one or more optional filter keyword parameters on the command.

The TPs are grouped by address space, with lines 4 through 6 repeated for each local TP running in an address space. Information about TPs processed by APPC/MVS servers (served TPs) is separate from information about TPs scheduled by an APPC/MVS transaction scheduler.

Lines 4-6 appear first for a local scheduled TP, if one is running in the address space. The LTPN= variable indicates local scheduled TPs. Lines 4 through 6 appear for each served TP running in an address space, if any. The STPN= variable indicates local served TPs.

An address space can contain, at most, one local inbound scheduled TP, together with TP. An address space can, however, contain any number of served local TPs.

In lines 4 through 6 of the message text:

LTPN=*tpname***|X'***hh***'***ccc*** or STPN=***tpname***|X'***hh***'***ccc*** In the message text:

tpname The local TP name. If the TP is scheduled by a transaction scheduler, LTPN= precedes the name. If the TP is served by an APPC/MVS server, STPN= precedes the name. The TP name is 1 to 64 characters long.

¬**X'***hh***'***ccc* The systems network architecture (SNA) service TP name. In the variable text:

hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.

ccc A character string, with a maximum length of 3.

For outbound conversations, ***UNKNOWN*** appears in this field.

LLUN=*luname* The logical unit (LU) name.

WUID=*workid* The work unit identifier, which the transaction scheduler assigns to a program instance using the Unit_of_Work_ID. The value in this field is ***UNKNOWN*** if:

- The transaction scheduler does not use the associate service
- The transaction scheduler does not use the Unit_of_Work_ID parameter on the associate service
- The TP is not scheduled by a transaction scheduler

CONVERSATIONS=*nnnnn* The number of conversations in which the TP is involved. The maximum value is 99999.

ASID=*asid* The address space identifier (ASID) to which the TP is associated.

SCHED=*schdname* The name of the transaction scheduler that scheduled the TP. It is the value of a SCHED keyword in the APPCPM*xx* parmlib member. If the TP is a batch job, started task, or TSO/E user, or if the TP is running under an LU that is not associated with a transaction scheduler (NOSCHED LU), ***NONE*** appears in this field.

ASNAME=*adspname* The name of the address space with which the TP is currently associated. If the local TP is running as a batch job, the job name appears in this field. If the local TP is running under TSO/E, the TSO/E userid appears in this field. If the local TP is running in a transaction initiator, a value from the TP profile appears in this field.

TPID=*tpid* The TP identifier. It is a 16-digit hexadecimal value. The field (including TPID=) does not appear for served TPs.

If the DISPLAY APPC,TP command includes the ALL parameter, the following lines appear in the message text:

- Lines 4 through 6
- One occurrence of lines 7 through 10 for each conversation in which the local transaction program is involved.

In lines 7 through 10 of the message text:

PTPN=*tpname***|X'***hh***'***ccc* In the message text:

tpname The partner TP name. It is 1 to 64 characters long. For inbound conversations, ***UNKNOWN*** appears in this field.

¬**X'***hh***'***ccc* The systems network architecture (SNA) service TP name. In the variable text:

hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.

ccc A character string, with a maximum length of 3.

For inbound conversations, ***UNKNOWN*** appears in this field.

PLUN=*unitname* The partner LU name. This name is network-qualified if the network ID is known.

PROTECTED=*ppp* An indicator of the synchronization level of the conversation. *ppp* is one of the following:

NO The conversation was allocated with a synchronization level of either None or Confirm.

YES The conversation was allocated with a synchronization level of Syncpt; it is a protected conversation.

USERID=*userid* The userid that flowed into or out of APPC/MVS on an Allocate request for this conversation. For an inbound conversation, it is the userid of the local system TP. For an outbound conversation, it is the userid of the partner TP. If a userid was not specified, ***NONE*** appears in this field.

DIRECTION=*dir* The direction of the conversation, which is one of the following:

INBOUND The conversation is inbound. It was allocated by the partner TP.

OUTBOUND The conversation is outbound. It was allocated by the local TP.

VERBS=*nnnnnnnn* The number of APPC callable services issued by the local TP on this conversation. The maximum value is 99999999.

IT=*nnnnnnnn* The amount of time that the local TP has been waiting for data or a confirmation from the partner TP. Depending on the amount of time, *nnnnnnnn* has one of the following formats:

sss.ttt **S** The time is less than 1000 seconds.

hh.mm.ss The time is at least 1000 seconds, but less than 100 hours.

hhhhh.mm The time is at least 100 hours.

************ The time is greater than 99999 hours.

NOTAVAIL The time-of-day (TOD) clock is not working

NONE The local TP is not waiting for data or a confirmation.

In the variable text:

ttt The number of milliseconds.

sss or *ss* The number of seconds.

mm The number of minutes.

hh or *hhhhh* The number of hours.

LCID=*lcid* The local conversation identifier. It is an 8-digit hexadecimal value. For a Virtual Telecommunications Access Method (VTAM) conversation, ***NONE*** appears in this field.

MODE=*modename* The mode used by the conversation.

VTAMCID=*cid* The VTAM conversation identifier. For a VTAM conversation, this provides the link between APPC and VTAM. For a local conversation, ***NONE*** appears in this field. It is an 8-digit hexadecimal value.

SYNC POINT IN PROG=*sss* An indication of whether a sync point operation is in progress for a protected conversation. *sss* is one of the following:

NO No Commit or Backout request is in progress.

YES A Commit or Backout request is in progress for a unit of recovery of a protected conversation.

LUWID=*luwid* The logical unit of work identifier, which is one of the following depending on the type of conversation:

- For an unprotected conversation, the LUWID is a value supplied by the TP that allocated the conversation.
- For a protected conversation, the LUWID represents the processing a program performs from one sync point to the next. This LUWID can be up to 33 bytes in length; the last 16 characters are the hexadecimal representation of the instance number and sequence number.

If the TP that allocated the conversation did not supply a LUWID, and the conversation is not a protected conversation, ***NONE*** appears in the display.

ATB200I LOGICAL UNIT *luname* **FOR TRANSACTION SCHEDULER** *schedname* **IS ACTIVE, BUT WILL REJECT ALL PROTECTED CONVERSATIONS UNTIL RRS/MVS IS ACTIVE.**

Explanation: The APPL statement for the logical unit specifies that it is capable of handling protected conversations, but it is waiting for the system syncpoint manager (RRS) to become active before allowing any protected conversations to be processed by the logical unit. Protected conversations are conversations with a synchronization level of syncpt.

In the message text:

luname The name of the logical unit that is waiting for the activation of the system syncpoint manager.

schedname The name of the scheduler that uses the specified logical unit.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system continues processing. The logical unit is in active state, but rejects Allocate requests for protected conversations.

Operator Response: Notify the system programmer. At the request of the system programmer, activate RRS.

System Programmer Response: Determine why RRS is not active. If RRS should be activated, notify the operator.

ATB201I LOGICAL UNIT *luname* **FOR TRANSACTION SCHEDULER** *schedname* **NOW ACCEPTS PROTECTED CONVERSATIONS.**

Explanation: The APPC/MVS LU can now process protected conversations.

In the message text:

luname The name of the logical unit that is now accepting protected conversations.

schedname The name of the scheduler that uses the specified logical unit.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The system continues processing. The logical unit is in active state, and accepts conversations with a synchronization level of syncpt, as well as levels of none and confirm.

ATB202I LOGICAL UNIT *luname* **IS RESTARTING. BECAUSE HARDENED DATA WAS LOST, INCOMPLETE UNITS OF RECOVERY MIGHT NOT BE RESOLVED TO A CONSISTENT STATE.**

Explanation: The system syncpoint manager (RRS) has lost hardened data and, therefore, might not be able to provide APPC/MVS with data for all incomplete units of recovery for the resource manager *luname*.

In the message text:

luname The name of the logical unit that is performing resource manager restart processing.

Source: APPC/MVS

Detecting Module: ATBPCRR

System Action: The system continues processing. APPC/MVS processes units of recovery that RRS returns.

System Programmer Response: See message ATR212I.

ATB203I LOGICAL UNIT *luname* **ENCOUNTERED AN INSTALLATION ERROR FOR LOGSTREAM:** *logstream_name***. SYSTEM LOGGER RETURN CODE:** *rc***, REASON CODE:** *rsncode* **FOR THE IXGCONN SERVICE.**

Explanation: APPC/MVS is attempting to restart *luname* as a resource manager. APPC/MVS received an error from the system logger while attempting to access the APPC/MVS log stream. Action must be taken before APPC/MVS can successfully access the log stream.

In the message text:

luname The name of the logical unit that encountered the installation error.

logstream_name The name of the APPC/MVS log stream.

rc The system logger return code from the IXGCONN service.

rsncode The system logger reason code from the IXGCONN service.

Source: APPC/MVS

Detecting Module: ATBPCRR

System Action: APPC/MVS activates this LU, but does not allow it to process protected conversations (conversations with a synchronization level of syncpt).

Operator Response: Notify the system programmer.

System Programmer Response: Take the action described for the IXGCONN return and reason codes in *OS/390 MVS Programming: Authorized Assembler Services Reference ENF-IXG*. Then reactivate the LU through either:

- Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for the LUs; or
- Entering a VTAM VARY INACT command, followed by a VARY ACT command for the LUs.

ATB204I LOGICAL UNIT OF WORK *luwid* **WITH CONVERSATION CORRELATOR** *convcorr* **IS** *outcome* **AT LU** *partner_lu* **BECAUSE OF RESYNCHRONIZATION BETWEEN LU** *local_lu* **AND LU** *partner_lu***.**

Explanation: This message indicates that during resynchronization processing, the logical unit of work (identified by logical unit of work ID *luwid* and conversation correlator *convcorr*) has been committed or backed out at the participating LUs.

In the message text:

luwid A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr A value that identifies the conversation that is being resynchronized.

outcome One of the following:

COMMITTED The overall outcome for the distributed unit of recovery is committed.

BACKED OUT The overall outcome for the distributed unit of recovery is backed out.

partner_lu The name of the logical unit that is the target of the resynchronization exchange.

local_lu The name of the logical unit that initiated the resynchronization exchange.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: Resynchronization processing completes by informing the system syncpoint manager (RRS) of the outcome of the expression of interest for the logical unit of work.

ATB205I RESYNCHRONIZATION FOR LOGICAL UNIT OF WORK *luwid* **WITH CONVERSATION CORRELATOR** *convcorr* **HAS COMPLETED, BUT RESOURCES FOR LOCAL LU** *local_lu* **AND PARTNER LU** *partner_lu* **HAVE NOT BEEN BROUGHT TO A CONSISTENT STATE.**

Explanation: APPC/MVS detected an out-of-synchronization condition that cannot be corrected by resynchronization. During resynchronization with a partner resource manager, APPC/MVS received an unexpected response that resulted from a heuristic decision made prior to or during resynchronization processing. Heuristic damage has been detected for the logical unit of work identified by *luwid* and conversation correlator *convcorr*.

More than one LU might be affected by the error reported in this message. If so, this message is displayed once for each affected LU.

In the message text:

luwid A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr A value that identifies the conversation that is being resynchronized.

local_lu The name of the logical unit that initiated the resynchronization exchange.

partner_lu The name of the logical unit that is the target of the resynchronization exchange.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: The system has detected the out-of-synchronization condition. A heuristic mixed state will be propagated to the initiator (if any) of the syncpoint operation for the logical unit of work.

Operator Response: Take installation-defined action to resynchronize the specified out-of-synchronization resource with the other participants in this logical unit of work.

ATB206E **LU** *luname1* **DETECTED A PROTOCOL VIOLATION MADE BY LU** *luname2* **DURING RESYNCHRONIZATION. THE RESYNCHRONIZATION HAS FAILED. SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL THE PROBLEM IS RESOLVED. REASON:** *description-of-protocol-violation*

Explanation: This message is issued during APPC/MVS resynchronization processing or exchange log name processing when an error is detected by *luname1* in the data sent by *luname2* during the transaction exchange.

In the message text:

luname1 The name of the logical unit that detected the protocol violation.

luname2 The name of the logical unit that generated the protocol violation.

description-of-protocol-violation One of the following:

COMPARE STATES GDS VARIABLE NOT RECEIVED During a resynchronization exchange, the partner did not send a Compare States GDS variable reply containing the state of the logical unit of work at the partner LU.

UNEXPECTED DATA RECEIVED FROM INITIATOR Unexpected data was received from a partner who was initiating a cold-start exchange log name transaction.

DEALLOCATE ABEND OF CONVERSATION NOT RECEIVED A deallocation of the exchange log name or resynchronization transaction conversation from the initiator was expected, but not received.

UNEXPECTED STATUS DATA RECEIVED FROM PARTNER Unexpected status data was received from a partner who was replying to an exchange log name or resynchronization transaction initiated by the local LU.

NO DATA RECEIVED FROM THE PARTNER During a resynchronization or exchange log name transaction exchange, the partner responded but failed to send GDS variable data containing the state of the partner LU.

UNEXPECTED DATA RECEIVED FROM PARTNER Unexpected data was received from a partner who was replying to an exchange log name or resynchronization transaction initiated by the local LU.

INVALID STATUS DATA RECEIVED FROM THE PARTNER Status data that was invalid for the reply was received by the initiator of the exchange log name or resynchronization transaction.

NO DATA RECEIVED FROM THE INITIATOR The initiator of the SNA service TP request failed to send GDS variable data describing the request.

TOO MUCH DATA RECEIVED FROM THE INITIATOR The initiator of the SNA service TP request sent more than the expected amount of GDS variable data for the request.

INVALID STATUS DATA RECEIVED FROM THE INITIATOR Status data that was invalid for the request was received by the partner of the exchange log name or resynchronization transaction.

SYNCPT CAPABILITIES NEGOTIATION NOT ALLOWED The partner attempted to negotiate syncpt capabilities while there was outstanding resynchronization work to be performed between the local and partner LUs.

UNEXPECTED COLD START REQUEST RECEIVED A cold-start exchange log name request was received from a partner LU while sessions were still active between the local and partner LUs. The request was rejected.

SYNCPT CAPABILITIES DO NOT MATCH The syncpt capabilities sent in an exchange log name GDS variable for a warm-start exchange do not match the capabilities previously negotiated by the the local and partner LUs.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: If this message is issued during APPC/MVS resynchronization processing to resolve incomplete units of recovery, resynchronization does not continue. Resynchronization will be attempted again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the warm/cold mismatch can be resolved.

Operator Response: Contact the operator at LU *luname2* to determine the cause of the error.

System Programmer Response: Examine the logrec data set of the local LU's system. When a protocol violation is detected during the transaction exchange of Exchange Log Names GDS variables or Compare States GDS variables, APPC/MVS records diagnostic information pertaining to the protocol violation made by the partner LU system. APPC/MVS sends message ATB70051I or ATB70056I to the partner system as log data when deallocating the resynchronization conversation abnormally.

ATB207I EXCHANGE LOG NAME PROCESSING HAS COMPLETED SUCCESSFULLY BETWEEN LOCAL LU *luname* **AND PARTNER LU** *pluname* **LOCAL LOG:** *local-log* **PARTNER LOG:** *partner-log*

Explanation: An APPC/MVS LU and its partner LU have successfully completed an exchange log name transaction, which must precede the allocation of protected conversations (conversations with a synchronization level of syncpt).

In the message text:

luname The name of the local LU that initiated the exchange log name transaction.

pluname The name of the logical unit that is the target of the exchange log name transaction.

local-log The name of the Local LU log.

partner-log The name of the partner LU log.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: The system continues processing. The local and partner LU pair can accept and process requests to allocate conversations with a synchronization level of syncpt between the LU pair.

Operator Response: None.

System Programmer Response: None.

ATB208I LOGICAL UNIT *luname* **FOR TRANSACTION SCHEDULER** *schedname* **WILL REJECT ALL PROTECTED CONVERSATIONS. THE RESOURCE MANAGER EXITS HAVE BEEN UNSET. NOTIFICATION EXIT REASON=***rsncode***.**

Explanation: Because of the reason indicated by *rsncode*, the resource manager notification exit for this logical unit has been unset. The LU can no longer accept protected conversations (conversations with a synchronization level of syncpt).

In the message text:

luname The name of the logical unit that can no longer accept protected conversations.

schedname The name of the scheduler that uses the specified logical unit.

rsncode The value passed to the resource manager notification exit for this LU. This value indicates why the resource manager exits have been unset. For an explanation of these values, see the description of field **value2** in the parameter list for the NOTIFICATION exit routine in *OS/390 MVS Programming: Resource Recovery*.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: The LU continues processing conversations with a synchronization level of none or confirm. Protected conversations (conversations with a synchronization level of syncpoint) are terminated at the time the exits are unset. APPC/MVS will attempt to reset this LU's resource manager exits, so the LU can resume processing protected conversations.

ATB209I LOGICAL UNIT *lu_name* **DETECTED A MAXBUFSIZE VALUE THAT IS TOO SMALL FOR THE APPC/MVS LOG STREAM** *logstream_name***. APPC/MVS EXPECTS A BUFFER SIZE OF AT LEAST 65276 BYTES.**

Explanation: APPC/MVS is attempting to restart this LU as a resource manager. APPC/MVS expects a buffer size of at least 65,276 bytes. The MAXBUFSIZE value returned from the IXGCONN service is smaller than 65,276.

In the message text:

lu_name The name of the LU that APPC/MVS is attempting to restart.

logstream_name The name of the APPC/MVS log stream.

Source: APPC/MVS

Detecting Module: ATBPCRR

System Action: APPC/MVS activates this LU, but does not allow it to process protected conversations (conversations with a synchronization level of syncpt).

Operator Response: Notify the system programmer.

System Programmer Response: Do the following:

1. Redefine the structure for the APPC/MVS log stream to have a MAXBUFSIZE value of at least 65,276 bytes.
2. Redefine the APPC/MVS log stream using the utilities provided by the system logger, and restart the LUs.
3. Reactivate the LU through either:
   - Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for the LUs; or
   - Entering a VTAM VARY INACT command, followed by a VARY ACT command for the LUs.

ATB210E A LOG NAME EXCHANGE INITIATED BY LU *luname1* **WITH LU** *luname2* **HAS FAILED. LU** *luname3* **DETECTED A WARM/COLD MISMATCH. AS A RESULT, SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL THE MISMATCH IS RESOLVED. REASON:** *reason*

Explanation: This message is issued during an exchange log name transaction when the local LU or partner LU has detected a warm/cold log status mismatch. An exchange log name transaction is

initiated following a session failure or at first session initiation after system restart.

In the message text:

luname1 The name of the logical unit that initiated the log name exchange

luname2 The name of the logical unit that is the target of the exchange log name

luname3 The name of the logical unit that detected the exchange log name error.

reason One of the following:

COLD LOG STATUS REJECTED BY INITIATOR The initiator of an exchange log name transaction rejected the local LU cold-log status because the initiating LU has incomplete units of work on its log that require resynchronization with the local LU.

RESYNC WORK EXISTS WITH THE PARTNER LU The initiator of an exchange log name transaction detected that the partner LU has reported a cold-log status. The cold-log status is rejected because the initiating LU has incomplete units of work on its log that require resynchronization with the partner LU.

COLD LOG STATUS REJECTED BY PARTNER The partner in an exchange log name transaction rejected the initiator LU cold-log status because the partner LU has incomplete units of work on its log that require resynchronization with the initiating LU.

RESYNC WORK EXISTS WITH THE INITIATOR LU The partner in an exchange log name transaction detected that the initiating LU has reported a cold-log status. The cold-log status is rejected because the partner LU has incomplete units of work on its log that require resynchronization with the initiating LU.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: If this message is issued during APPC/MVS resynchronization processing to resolve incomplete units of recovery, resynchronization does not continue. If APPC/MVS is the initiator of resynchronization processing, APPC/MVS will attempt resynchronization again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the warm/cold mismatch can be resolved.

Symptom records are written to the logrec data set to record the error condition and record diagnostic data.

Operator Response: Notify the system programmer.

System Programmer Response: For complete information on resolving this problem, see the description of how to handle warm/cold mismatch in *OS/390 MVS Planning: APPC/MVS Management*.

ATB211E A LOG NAME EXCHANGE INITIATED BY LU *luname1* WITH LU *luname2* HAS FAILED. LU *luname3* DETECTED A LOG NAME MISMATCH. AS A RESULT, SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL THE MISMATCH IS RESOLVED. REASON: *reason*

Explanation: A log name mismatch was detected during an exchange log name request by *luname3* during conversation allocation processing between *luname1* and *luname2* or during a resynchronization exchange between *luname1* and *luname2* to bring distributed units of recovery to a consistent state after a session or system failure.

reason further describes the cause of the log name mismatch.

In the message text:

luname1 The name of the LU that initiated the log name exchange

luname2 The name of the LU that is the target of the exchange log name

luname3 The name of the LU that detected the mismatch

reason One of the following:

PARTNER XLN REPLY LOG NAME DOES NOT MATCH LOCAL LOG The log name sent by the partner LU in reply to the exchange log name request does not match what is stored by the local LU in its log.

ABNORMAL REPLY RECEIVED FROM PARTNER LU The initiator of an exchange log name transaction received an abnormal reply from the partner LU. The most likely cause of this abnormal reply is a mismatch between the log name sent by the local LU in the exchange log name GDS variable, and the log name for the initiator LU stored in the partner's log.

PARTNER XLN REQUEST LOG NAME DOES NOT MATCH LOCAL LOG The log name sent by the initiator LU in the exchange log name request does not match what is stored by the local LU in its log.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: If this message is issued during APPC/MVS resynchronization processing to resolve incomplete units of recovery, resynchronization does not continue. Resynchronization will be attempted again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the log name mismatch can be resolved.

Symptom records are written to the logrec data set to record the error condition and record diagnostic data.

Operator Response: Ensure that the local system has restarted with the correct system logs, including the correct RRS log group name (GNAME parameter specified on the RRS cataloged procedure).

Contact the operator for the partner system to ensure that the partner system restarted with the correct system logs.

Make sure to provide the complete text of message ATB227I, if it is issued.

System Programmer Response: The cause of the log name mismatch may be due to:

- The incorrect system log being used on the local or partner system.
- An internal error in APPC/MVS logging or in the logging function of the partner system.

If an incorrect system log caused the problem, attempt to correct the log name mismatch problem on the partner system using the partner system's local log name mismatch recovery procedures. For complete information on resolving this problem, see the description of how to handle log name mismatch in *OS/390 MVS Planning: APPC/MVS Management*.

ATB212E **LU** *luname1* **DETECTED A PROTOCOL VIOLATION IN THE EXCHANGE LOG NAME DATA SENT BY LU** *luname2***. SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL THE PROBLEM IS RESOLVED.**

Explanation: This message is issued during APPC/MVS resynchronization or exchange log name processing when an error is detected by *luname1* in the negotiated syncpoint capabilities sent by *luname2*. The partner responded with an indication that it supports a capability that APPC/MVS does not support.

In the message text:

luname1 The name of the LU that detected the protocol violation.

luname2 The name of the LU that generated the protocol violation.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: If this message is issued during APPC/MVS resynchronization processing to resolve incomplete units of recovery, resynchronization does not continue. Resynchronization will be attempted again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the protocol violation can be corrected.

Operator Response: Contact the operator at LU *luname2* to determine the cause of the error.

System Programmer Response: Examine the logrec data set of the local LU's system. When a protocol violation is detected during the transaction exchange of Exchange Log Names GDS variables or Compare States GDS variables, APPC/MVS records diagnostic information pertaining to the protocol violation made by the partner LU system. APPC/MVS sends message ATB70051I or ATB70056I to the partner system as log data when deallocating the resynchronization conversation abnormally.

ATB213I **LOGICAL UNIT OF WORK** *luwid* **WITH CONVERSATION CORRELATOR** *convcorr* **REQUIRED RESYNCHRONIZATION ON** *mm/dd/yyyy* **AT** *resynctime***. TO RESOLVE THE LOGICAL UNIT OF WORK, RESYNCHRONIZATION HAS STARTED BETWEEN LOCAL LU** *luname* **AND PARTNER LU** *pluname***.**

Explanation: This message notifies the operator that APPC/MVS detected a need for resynchronization of a logical unit of work involving APPC/MVS logical unit *luname* and logical unit *pluname*.

In the message text:

luwid A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr A value that identifies the conversation that is being resynchronized.

mm/dd/yyyy The date on which resynchronization was initiated for the distributed unit of recovery identified by *luwid* and *convcorr*.

resynctime The time at which resynchronization was initiated for the distributed unit of recovery identified by *luwid* and *convcorr*.

luname The name of the LU that initiated the resynchronization exchange.

pluname The name of the LU that is the target of the resynchronization exchange.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: Resynchronization has been scheduled for the specified logical unit of work.

Operator Response: Note this message for future reference. It might be needed for problem determination.

ATB214I **THE RESYNCHRONIZATION OF LOGICAL UNIT OF WORK** *luwid* **WITH CONVERSATION CORRELATOR** *convcorr* **IS BEING SUSPENDED ON** *mm/dd/yyyy* **AT** *resynctime***. RESYNCHRONIZATION WAS STARTED BY LOCAL LU** *luname* **ON** *mm/dd/yyyy* **AT** *resynctime* **FOR THE LOGICAL UNIT OF WORK. THE LOCAL LU WILL TRY AGAIN TO RESYNCHRONIZE WITH LU** *pluname* **TO RESOLVE THE LOGICAL UNIT OF WORK.**

Explanation: This message indicates an attempt to resynchronize logical unit of work represented by the ID *luwid* and conversation correlator *convcorr*. Resynchronization can be delayed by the inability to establish connections with the conversation partner, a log name mismatch or a protocol violation that requires operator intervention. APPC/MVS periodically retries resynchronization after encountering such recoverable errors.

In the message text:

luwid A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr A value that identifies the conversation that is being resynchronized.

mm/dd/yyyy The date on which resynchronization is being suspended due to a failure to complete a resynchronization exchange for logical unit of work *luwid* and *convcorr* with LU *pluname*.

resynctime The time at which:

- Resynchronization is suspended because of a failure to complete a resynchronization exchange for *luwid* and *convcorr* with *pluname*, or
- Resynchronization originally began for *luwid* and *convcorr* with *pluname*.

luname The name of the LU that initiated the resynchronization exchange.

partner_lu The name of the LU that is the target of the resynchronization exchange.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: Resynchronization has been scheduled for the specified logical unit of work; after the APPC/MVS-defined time-out period, APPC/MVS will begin resynchronization again.

Operator Response: If resynchronization continues to be delayed, you might need to communicate with other operators (if the resources are supported at different locations), or contact the system programmer.

System Programmer Response: The error that caused resynchronization for the logical unit of work to fail has been recorded by a symptom record written to the logrec data set. Keep the symptom record for future reference; you might need it for problem determination.

ATB215E LOGICAL UNIT *pluname* HAS ISSUED A DEALLOCATE OF TYPE DEALLOCATE_ABEND TO ABNORMALLY TERMINATE THE RESYNCHRONIZATION TRANSACTION EXCHANGE.

Explanation: This message is issued during initialization processing of exchange log names or APPC/MVS resynchronization recovery processing if the partner in the resynchronization transaction issues a deallocate type of abend on the resynchronization conversation. The partner might do so because of a protocol violation in exchange log name data, or compare states data sent by the local system and detected by the partner.

An appropriate message indicating the cause of the error may be displayed on the partner LU system.

In the message text:

pluname The name of the LU that deallocated the resynchronization conversation abnormally.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: If this message is issued during exchange log name processing for an allocate request or an inbound attach request, the protected conversation allocate request or inbound attach request fails.

If this message is issued during resynchronization processing, initiated by APPC/MVS, the resynchronization attempt fails and APPC/MVS will attempt resynchronization for the logical unit of work at a later time.

System Programmer Response: Examine the log of the partner LU's system. If a protocol violation was detected in the local system's Exchange log Names GDS variable or Compare States GDS variable, the remote system may have generated diagnostic information itself. This information may help to diagnose the cause of a protocol violation.

ATB216E PROTOCOL VIOLATION DETECTED IN THE RESYNCHRONIZATION OF LOGICAL UNIT OF WORK *luwid* WITH CONVERSATION CORRELATOR *convcorr*. LOGICAL UNIT OF WORK STATE SENT WAS *state* AND LOGICAL UNIT OF WORK STATE RECEIVED FROM LU *luname* WAS *state*.

Explanation: Resynchronization processing detected a response that violates the resynchronization protocol during resynchronization of logical unit of work *luwid*. Resynchronization support in the syncpoint manager at LU *luname* probably has a program error.

In the message text:

luwid A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr A value that identifies the conversation that is being resynchronized.

state One of the following:

RESET
IN DOUBT
COMMITTED
HEURISTIC RESET
HEURISTIC COMMITTED
HEURISTIC MIXED

luname The name of the partner LU that participated in the resynchronization transaction and the protocol violating state value was received from.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: APPC/MVS suspends the resynchronization for the logical unit of work with the specified LU, and issues message ATB214I. A resynchronization request for the logical unit of work will be attempted at a later time.

Operator Response: Make inquiries to determine the state of the resources. Take installation-defined action to resynchronize the resources. Installation-defined action may include removing APPC/MVS's interest for the logical unit of work. For information on removing interest in RRS units of recovery, see *OS/390 MVS Programming: Resource Recovery*.

ATB217I EXCHANGE LOG NAME PROCESSING INITIATED BY LU *luname1* WITH LU *luname2* HAS FAILED ON *mm/dd/yyyy* AT *resynctime*. THE LOCAL LU WILL TRY AGAIN TO COMPLETE A SUCCESSFUL EXCHANGE LOG NAME WITH LU *pluname*. SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL AN EXCHANGE LOG NAME TRANSACTION COMPLETES.

Explanation: This message is issued during resource manager restart processing, prior to initiation of resynchronization recovery processing for incomplete units of recovery returned by the system syncpoint manager (RRS). During the exchange log name interchange, an error prevented the exchange log name transaction from completing successfully.

In the message text:

luname1 The name of the LU that initiated the log name exchange

luname2 The name of the LU that is the target of the exchange log name

mm/dd/yyyy The date on which the exchange log name process is suspended.

resynctime The time at which the exchange log name process is suspended.

pluname The name of the LU that is the target of the resynchronization exchange.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: APPC/MVS suspends resynchronization recovery processing for incomplete units of recovery returned during resource manager restart processing, until an exchange log name transaction completes successfully between *luname1* and *luname2*. *luname1* will try again to complete an exchange log name transaction with *luname2*.

Operator Response: Contact the operator at *luname2* to determine the status of *luname2*.

ATB218E PROTOCOL VIOLATION DETECTED IN THE *gds-variable-name* **DATA SENT BY LU** *luname***. THE RESYNCHRONIZATION HAS FAILED.**

Explanation: This message is issued during APPC/MVS exchange log name processing or APPC/MVS resynchronization recovery processing. If this message is issued during exchange log processing, it indicates that a format error was detected in the exchange log name data sent by another communications resource manager.

If this message is issued during APPC/MVS resynchronization recovery, it indicates that a format error was detected in the exchange log name data or the compare states data that is sent by a communications resource manager as part of resynchronization recovery.

In the message text:

gds-variable-name One of the following:

- EXCHANGE LOG NAMES GDS VARIABLE
- COMPARE STATES GDS VARIABLE

luname The name of the LU that sent a GDS variable containing a protocol violation in its format.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: If this message is issued during APPC/MVS resynchronization processing to resolve incomplete units of recovery, resynchronization does not continue. Resynchronization will be attempted again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the protocol violation can be corrected.

Operator Response: Contact the operator at LU *luname* to determine the cause of the error.

System Programmer Response: Examine the logrec data set of the local LU's system. When a protocol violation is detected during the transaction exchange of Exchange Log Names GDS variables or Compare States GDS variables, APPC/MVS records diagnostic information pertaining to the protocol violation made by the partner LU system. APPC/MVS sends message ATB70051I or ATB70056I to the partner system as log data when deallocating the resynchronization conversation abnormally.

ATB219E APPC/MVS, AS INITIATOR OF A RESYNCHRONIZATION, HAS RECEIVED AN ERROR REPLY IN THE COMPARE STATES DATA FROM LU *luname***. THE RESYNCHRONIZATION HAS FAILED.**

Explanation: A resynchronization interchange originated by APPC/MVS has received an error reply in the compare states data from its partner.

The error reply resulted because the partner LU detected a violation in the compare states data that was sent by APPC/MVS.

In the message text:

luname The name of the LU that sent a GDS variable that contains an abnormal reply indication.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: APPC/MVS suspends resynchronization with the partner LU and issues message ATB214I. After a system-specified time interval, APPC/MVS will initiate the resynchronization exchange again.

Operator Response: Contact the operator at LU *luname* to determine the cause of the error. Manual intervention might be required to finish the resynchronization and allow the unit of recovery to complete.

System Programmer Response: Examine the log of the partner LU's system. If a protocol violation was detected in the local system's Exchange log Names GDS variable or Compare States GDS variable, the remote system may have generated diagnostic information itself. This information may help to diagnose the cause of a protocol violation.

ATB220I PROTOCOL VIOLATION MADE BY LU *luname1* **WAS DETECTED BY LU** *luname2* **IN THE SYNCPOINT PROCESSING OF LUWID** *luwid* **WITH CONVERSATION CORRELATOR** *convcorr***.** *syncpoint-message-in-error***. THE SYNCPOINT PROCESSING WAS TERMINATED.**

Explanation: The local LU has detected a response sent by the partner LU that violates the syncpoint exchange protocol during the syncpoint processing of a logical unit of work.

In the message text:

luname1 The network-qualified name of the partner LU that violated the syncpoint exchange protocol

luname2 The network-qualified name of the LU that detected the protocol violation

luwid A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr A value that uniquely identifies the branch of the transaction tree for which the syncpoint exchange is being conducted.

syncpoint-message-in-error One of the following:

NO PS HEADER WAS RECEIVED
EXPECTED PS HEADER WAS NOT RECEIVED
EXPECTED STATUS WAS NOT RECEIVED

UNEXPECTED RETURN CODE WAS RECEIVED
UNEXPECTED DATA WAS RECEIVED
CONVERSATION STATE WAS INVALID

Source: APPC/MVS

Detecting Module: ATBPCBO, ATBPCCM, ATBPCDS, ATBPCEF, ATBPCEU ATBPCPR

System Action: Syncpoint processing continues, but APPC/MVS deallocates the protected conversation and the state of the distributed resources is unknown; a heuristic condition might exist. If the TPs involved in the deallocated conversation use the Error_Extract service, they will receive message ATB80134I, which indicates why the conversation was terminated during the syncpoint operation.

Operator Response: Notify the system programmer or the operator at *luname1* to determine the cause of the protocol violation.

ATB221I AN ATRSUSI CALL ISSUED TO SET *side_information* **HAS FAILED. INTERNAL REASON CODE =** *rsncode***.**

Explanation: APPC/MVS issued a call to the ATRSUSI service, which is a service of the system syncpoint manager (RRS). The call failed. When such a failure is detected during a syncpoint exchange, the system cannot perform logical unit of work management (that is, back out the next LUWID, or dismantle the syncpoint tree), as specified by the LU 6.2 syncpoint architecture.

In the message text:

side_information One of the following:

DRIVE BACKOUT
BREAK TREE

rsncode The code returned by the ATRSUSI service. Codes from this service are documented in *OS/390 MVS Programming: Resource Recovery*.

Source: APPC/MVS

Detecting Module: ATBPCBO, ATBPCCM, ATBPCDS, ATBPCEF, ATBPCEU, ATBPCPR

System Action: APPC/MVS terminates the syncpoint processing for the logical unit of work luwid with the conversation correlator convcorr.

Application Programmer Response: The application program should backout all local resources associated with the next unit of recovery and abnormally deallocate all APPC/MVS protected conversations associated with the next unit of recovery to cause all remote resources associated with the local application to backout also.

Operator Response: Notify the system programmer.

System Programmer Response: Search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center, and provide the dump that was taken when the error occurred.

ATB222I LOGICAL UNIT *luname* **ATTEMPTED A SYSTEM LOGGER SERVICE FOR A LOGSTREAM THAT HAS NOT BEEN DEFINED. THE LOGSTREAM NAME IS:** *logstream_name***.**

Explanation: APPC/MVS received an error from system logger while attempting to access the APPC/MVS log stream. The system logger return and reason codes indicate that the APPC/MVS log stream has not been defined to the system. Without a log stream, APPC/MVS cannot process protected conversations (conversations with a synchronization level of syncpt).

In the message text:

luname The APPC/MVS LU that attempted to access the log stream.

logstream_name The name of the APPC/MVS log stream.

Source: APPC/MVS

Detecting Module: ATBPCRR

System Action: APPC/MVS logical units continue processing conversations with a synchronization level of none or confirm, but cannot process any protected conversations.

Operator Response: Notify the system programmer.

System Programmer Response: To correct the problem, define the APPC/MVS log stream as documented in *OS/390 MVS Planning: APPC/MVS Management*. Then, reactivate the LU through either:

- Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for this LU; or
- Entering a VTAM VARY INACT command, followed by a VARY ACT command for this LU.

ATB223I APPC/MVS ENCOUNTERED INTERNAL ERRORS WHILE ISSUING A LOGGING SERVICE. LOGGING SERVICES ARE NOT AVAILABLE.

Explanation: This message is issued when an APPC/MVS internal error occurs while initializing the logging service or performing logging of protected conversation information. Because the logging service is not available, APPC/MVS cannot process any protected conversations (conversations with a synchronization level of syncpt).

Source: APPC/MVS

Detecting Module: ATBPCLT

System Action: APPC/MVS issues an SVC dump. APPC/MVS logical units continue processing conversations with a synchronization level of none or confirm, but cannot process any protected conversations.

Operator Response: Notify the system programmer.

System Programmer Response: Search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center, and provide the dump that was taken when the error occurred.

ATB224I BECAUSE OF AN INTERNAL ERROR, LOGICAL UNIT *luname* **IS ACTIVE, BUT WILL REJECT ALL PROTECTED CONVERSATIONS.**

Explanation: An internal error occurred while APPC/MVS was initializing the logical unit *luname*. A system dump might accompany this message.

The LU can process only conversations with a synchronization level of none or confirm.

In the message text:

luname The name of the logical unit that APPC/MVS was initializing.

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: APPC/MVS activates the LU, which is capable of processing only conversations with a synchronization level of none or confirm.

Operator Response: Notify the system programmer.

System Programmer Response: To correct the problem, follow the responses for the ATB message or EC7 abend reason code that accompanies ATB224I. Then, reactivate the LU through either:

- Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for this LU; or
- Entering a VTAM VARY INACT command, followed by a VARY ACT command for this LU.

If the error persists, search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center with the dump that was taken when the error occurred.

ATB225I LOGICAL UNIT *luname* **IS ACTIVE, BUT WILL REJECT ALL PROTECTED CONVERSATIONS BECAUSE OF A FAILURE RETURN CODE FROM THE** *service* **SERVICE. RETURN CODE IS** *retcode***.**

Explanation: While trying to initialize a logical unit, APPC/MVS received an error return code from registration services or from an RRS service.

In the message text:

luname The name of the logical unit that APPC/MVS was initializing

service The name of the registration service or RRS service that returned the non-zero return code

retcode The return code from the registration service

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: APPC/MVS activates the LU, but it can process only conversations with a synchronization level of none or confirm.

Operator Response: Notify the system programmer.

System Programmer Response: To correct the problem, follow the response for the registration service reason code, which is described in *OS/390 MVS Programming: Resource Recovery*. Then, reactivate the LU through either:

- Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for this LU; or
- Entering a VTAM VARY INACT command, followed by a VARY ACT command for this LU.

If the error persists, search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB226I LOGICAL UNIT *luname* **IS ACTIVE, BUT WILL REJECT ALL PROTECTED CONVERSATIONS UNTIL RRS/MVS NOTIFIES APPC/MVS ABOUT THE STATUS OF RESOURCE MANAGER EXITS.**

Explanation: APPC/MVS has activated an LU, but cannot allow it to process protected conversations until the system syncpoint manager (RRS) communicates the status of resource manager exits. This is a temporary condition that APPC/MVS will correct, once it receives notification from RRS.

In the message text:

luname The name of the logical unit that APPC/MVS activated

Source: APPC/MVS

Detecting Module: ATBLUPR

System Action: APPC/MVS activated the LU, but it can process only conversations with a synchronization level of none or confirm.

Operator Response: If the system does not issue an ATB201I message for this LU, notify the system programmer.

System Programmer Response: If the LU does not become capable of processing protected conversations, search the problem reporting data bases for a fix to the problem. If no fix exists, contact the IBM Support Center.

ATB227I LOCAL LU *luname* **IS** *log-status* **AS A RESOURCE MANAGER WITH RRS/MVS. LOCAL LOG:** *logname*

Explanation: Local LU *luname* has begun resource manager restart processing with the system syncpoint manager (RRS).

In the message text:

luname The name of the logical unit that is beginning resource manager restart processing with the system syncpoint manager (RRS).

log-status

COLD STARTING The local LU is cold starting because RRS is cold starting.

WARM STARTING The local LU is warm starting because RRS is warm starting.

logname The name of the local LU log.

Source: APPC/MVS

Detecting Module: ATBPCRS

System Action: The system continues processing. Upon completion of resource manager restart processing, the local LU will initiate resynchronization for incomplete units of recovery if any are returned by the syncpoint manager and will process conversations with a synchronization level of syncpt.

Operator Response: None.

System Programmer Response: None.

ATB228I LOGICAL UNIT *luname* **CONNECTED TO A SYSTEM LOGGER DASD-ONLY LOG STREAM. APPC/MVS DOES NOT SUPPORT THE DASD-ONLY LOG STREAM CONFIGURATION. ALL PROTECTED CONVERSATION REQUESTS WILL BE REJECTED.**

Explanation: During resource manager restart processing for logical unit *luname*, APPC/MVS attempted to connect to the APPC/MVS LU Lognames log stream, but discovered that the log stream is defined to System Logger as DASD-ONLY. APPC/MVS does not support DASD-ONLY configured log streams.

Source: APPC/MVS

Detecting Module: ATBPCRR

System Action: APPC/MVS disconnects from the log stream. APPC/MVS cannot process any protected conversations for logical unit luname. The logical unit remains active to process conversations with a synchronization level of none or confirm only.

System Programmer Response: Re-define the APPC/MVS LU logname's log stream so that the log stream resides in a coupling facility. For more information on defining a log stream to be resident in a coupling facility. see *OS/390 MVS Setting Up a Sysplex* and *OS/390 MVS Programming: Assembler Services Reference*.

After re-defining the log stream to reside in a coupling facility, reactivate the LU by performing an LUDEL followed by an LUADD or vary the LU inactive and then active again using the VTAM VARY command.

ATB229E APPC/MVS WAS NOT ABLE TO RESYNCHRONIZE THE INCOMPLETE UNIT OF RECOVERY *urid* IN IN-DOUBT STATE. MANUAL INTERVENTION IS REQUIRED TO RESOLVE THIS UR.

Explanation: The contents of the APPC/MVS logstream cannot be used to resolve incomplete units of recovery in in-doubt state. The logstream may have been deleted and redefined or an internal APPC/MVS error has occurred. As a result, APPC/MVS is unable to automatically resynchronize these URs when the LU is reinitialized.

In the message text:

luname The name of the logical unit that is beginning resource manager restart processing with the system syncpoint manager (RRS).

Source: APPC/MVS

Detecting Module: ATBPCRR

System Action: The unit of recovery remains in in-doubt state until manual intervention resolves it. APPC/MVS will not not perform resynchronization for this UR.

Operator Response: None.

System Programmer Response: Go to the RRS administration panels and resolve the in-doubt UR identified by urid. For more information on how to use these panels, see *OS/390 MVS Programming: Resource Recovery*.

ATB275I SIDEINFO KEYWORD WAS NOT PROCESSED DUE TO SYSTEM ERROR. REASON CODE=*reason-code*

Explanation: The Advanced Program-to-Program Communication (APPC) side information file could not be used because of a system error.

In the message text:

reason-code The hexadecimal reason code from dynamic allocation.

Source: APPC/MVS

Detecting Module: ATBSD93

System Action: If the error occurs while the system is processing a START command, the system does not process allocate requests that require side information. If the error occurs while the system is processing a SET command, the system continues processing with the side information file it was using before the operator entered the SET command.

Operator Response: Enter the START or SET command again. If the error occurs again, notify the system programmer.

System Programmer Response: If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB277E SIDEINFO KEYWORD IGNORED. DATA SET WAS NOT OPENED SUCCESSFULLY.

Explanation: To process a SET or START command, the system tried to process an OPEN macro. While the system was processing the OPEN macro, an error occurred.

Source: APPC/MVS

Detecting Module: ATBDF30

System Action: If the error occurs while the system is processing a START command, the system does not process requests that require side information. If the error occurs while the system is processing a SET command, the system continues processing with the side information file it was using before the operator entered the SET command.

Operator Response: Enter the START or SET command again.

System Programmer Response: Ensure that the Systems Application Architecture (SAA) common programming interface (CPI) communications side information data set specified in parmlib is correct.

ATB278E LOGICAL UNIT *unitname* NOT ADDED. TP PROFILE DATA SET WAS NOT OPENED SUCCESSFULLY.

Explanation: To process a SET or START command, the system tried to process an OPEN macro. While the system was processing the OPEN macro, an error occurred.

Source: APPC/MVS

Detecting Module: ATBDF30

System Action: The system does not add or modify the LU in the system configuration.

Operator Response: After the system programmer corrects the problem, enter the SET command again.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB279I SIDEINFO KEYWORD IGNORED. DATA SET SPECIFIED IS ALREADY THE ACTIVE SIDEINFO DATA SET.

Explanation: An Advanced Program-to-Program Communication (APPC) side information file is already active on the system. The file was processed by a previous SET command.

Source: APPC/MVS

Detecting Module: ATBSD93

System Action: The system continues processing.

ATB280E SIDEINFO KEYWORD IGNORED. SIDEINFO DATA SET WAS NOT ALLOCATED. REASON CODE=*reason-code*

Explanation: The system could not allocate the side information file.

In the message text:

reason-code The hexadecimal reason code from dynamic allocation.

Source: APPC/MVS

System Action: The system continues processing.

ATB281E LOGICAL UNIT *unitname* NOT ADDED. TP PROFILE DATA SET WAS NOT ALLOCATED. REASON CODE=*reason-code*

Explanation: To process a SET or START command, the system tried to open the transaction program (TP) data set. The TP data set was not allocated.

In the message text:

unitname The logical unit (LU) name.

reason-code The hexadecimal reason code from dynamic allocation.

Source: APPC/MVS

Detecting Module: ATBDF30

System Action: The system does not add or modify the LU in the system configuration.

Operator Response: After the system programmer corrects the problem, enter the SET command again.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB300E Message *msgid* not found.

Explanation: The APPC/MVS administration utility encountered an internal error.

Source: APPC/MVS

Detecting Module: ATBCMPC, ATBFMAX, ATBFMFP, ATBVEAT, ATBMISO

System Action: The APPC/MVS administration utility does not perform the request.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the following:

- The associated transaction program (TP) profile data set or side information file. Both these files are Virtual Storage Access Method (VSAM) key sequenced data sets (KSDS). For information about copying the VSAM KSDS, see *DFSMS/MVS Access Method Services for ICF*.
- A copy of APPC/MVS administration utility processing job that was running when the system issued this message.

ATB301I *data*

Explanation: The APPC/MVS administration utility encountered an incorrect delimiter.

In the message text:

data The line containing the error.

Source: APPC/MVS

System Action: The request fails. The APPC/MVS administration utility continues processing the job. preceding messages further describe the error.

User Response: Follow the user response for the preceding message(s).

ATB302I *Request* **request syntax checked successfully - no warning message(s) issued.**

Explanation: The APPC/MVS administration utility scanned a request for syntax errors before running the utility processing job.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The system continues processing.

ATB303I APPC administration utility has begun.

Explanation: The APPC/MVS administration utility started successfully.

Source: APPC/MVS

System Action: The system continues processing.

ATB304I APPC not present. TPADD and TPMODIFY syntax checked only.

Explanation: Because APPC is not present, the APPC/MVS administration utility only performs syntax checking on the TPADD and TPMODIFY requests.

Source: APPC/MVS

System Action: The system continues processing.

ATB305I APPC not present. JCL of TPADD and TPMODIFY requests not checked.

Explanation: Because APPC is not present, the APPC/MVS administration utility only performs syntax checking on the TPADD and TPMODIFY requests. It does not check the JCL syntax.

Source: APPC/MVS

System Action: The system continues processing.

ATB306I Only syntax checking will be performed on request(s).

Explanation: An APPC/MVS administration utility job was requested with TYPRUN=SCAN specified.

Source: APPC/MVS

System Action: The APPC/MVS administration utility only checks syntax. It does not perform the requests. The APPC/MVS administration utility issues message ATB302I when syntax checking is complete.

ATB307I APPC administration utility processing completed - one or more requests failed.

Explanation: The APPC/MVS administration utility encountered one or more errors in the utility processing job.

Source: APPC/MVS

System Action: The APPC/MVS administration utility fails the requests associated with the errors and completes the others. Preceding messages further describe the errors.

User Response: Follow the user response for the preceding message(s). Correct and resubmit the failing requests.

ATB308I APPC admin. utility processing terminated - a severe error was encountered.

Explanation: The APPC/MVS administration utility encountered an internal error.

Source: APPC/MVS

System Action: The job fails. The utility processes no more requests. The system may issue an SVC dump.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump if one is issued.

ATB309I *Request* **request completed successfully.**

Explanation: The APPC/MVS administration utility successfully completed the request.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The system continues processing.

ATB310I *Request* **completed successfully - warning message(s) issued.**

Explanation: The APPC/MVS administration utility completed the request, but issued attention messages.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The APPC/MVS administration utility issues a message explaining the error.

User Response: See the following message for an explanation of the problem. Correct the keyword and resubmit the request.

ATB311I *Request* **request failed.**

Explanation: The APPC/MVS administration utility could not successfully complete the specified request.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The request fails but the job continues processing. The APPC/MVS administration utility issues messages explaining the error.

User Response: See the preceding messages for an explanation of the problem. Correct the error and resubmit the request.

ATB312I **Severe error processing** *request* **request.**

Explanation: The APPC/MVS administration utility encountered an internal error while processing a request.

Source: APPC/MVS

System Action: The job fails. The system may issue an SVC dump.

User Response: If necessary, resubmit the job without the failing request.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the following:

- The associated transaction program (TP) profile data set or side information file. Both these files are Virtual Storage Access Method (VSAM) key sequenced data sets (KSDS). For information about copying the VSAM KSDS, see *DFSMS/MVS Access Method Services for ICF*.
- A copy of the APPC/MVS administration utility processing job that was running when the system issued this message.
- The SVC dump, if issued.
- The text of this message.

ATB313I **APPC administration utility processing completed successfully.**

Explanation: The APPC/MVS administration utility successfully completed processing a job.

Source: APPC/MVS

System Action: The system continues processing.

ATB314I **APPC administration utility processing completed - warning message(s) issued.**

Explanation: The APPC/MVS administration utility completed a request but issued attention messages.

Source: APPC/MVS

System Action: The APPC/MVS administration utility issues a message explaining the error and providing the name of the failed keyword.

User Response: See the following message for an explanation of the problem. If necessary, correct the error and run the job again.

ATB317I Start of statement image records.

Explanation: This message marks the start of statement image records in the job output for a TPADD or TPMODIFY request's JCL.

Source: APPC/MVS

System Action: The system continues processing.

ATB318I End of statement image records.

Explanation: This message marks the end of statement image records in the job output for a TPADD or TPMODIFY request.

Source: APPC/MVS

System Action: The system continues processing.

ATB319I No JCL error messages encountered by APPC administration utility.

Explanation: The APPC/MVS administration utility did not encounter any JCL errors while processing the job.

Source: APPC/MVS

System Action: The system continues processing.

ATB322I No output returned by APPC administration utility for *request*.

Explanation: The APPC/MVS administration utility did not generate any output for this request. The SYSSDOUT data set is empty.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The system continues processing.

ATB323I Processing of *request* request has begun.

Explanation: The APPC/MVS administration utility has begun processing a request.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The system continues processing.

ATB324I *Request* request syntax checked successfully - warning message(s) issued.

Explanation: An APPC/MVS administration utility job was requested with TYPRUN=SCAN specified. The APPC/MVS administration utility issued attention messages.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The system continues processing. Preceding messages further describe the error.

User Response: Correct the request syntax and resubmit the request.

ATB326I *Request* request syntax checking failed.

Explanation: The APPC/MVS administration utility could not complete syntax checking.

Source: APPC/MVS

System Action: The job fails.

User Response: See *OS/390 MVS Planning: APPC/MVS Management* for more information.

ATB327I Error freeing APPC administration utility storage - Freemain RC: *rc*.

Explanation: The APPC/MVS administration utility encountered an error while attempting to free storage.

In the message text:

rc The return code from the FREEMAIN macro (in decimal).

Source: APPC/MVS

System Action: The APPC/MVS administration utility job ends.

Operator Response: Notify the system programmer. Obtain an ABEND dump.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the ABEND dump and the FREEMAIN macro return code.

ATB328I *Request* **not performed due to TYPRUN=APPC and APPC not present.**

Explanation: Because APPC is not present and TYPRUN=APPC was specified, the APPC/MVS administration utility does not perform the request. Syntax checking only is performed.

Source: APPC/MVS

System Action: The APPC/MVS administration does not process the request but continues processing with the next request.

ATB330I **Error deleting load module** *module* **- Delete RC:** *rc*

Explanation: The APPC/MVS administration utility encountered an error while attempting to delete the non-APPC transaction scheduler syntax checking exit.

In the message text:

module The name of the load module that could not be deleted.

rc The reason code from the DELETE macro (in decimal).

Source: APPC/MVS

System Action: The request fails but the job continues processing.

User Response: Report the problem to your system administrator.

ATB332I **APPC administration utility failed to free storage.**

Explanation: The APPC/MVS administration utility encountered an internal error.

Source: APPC/MVS

System Action: The job fails.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB333I **Error closing file** *ddname* **- Close RC:** *rc***.**

Explanation: The APPC/MVS administration utility encountered an error while trying to close a data set.

In the message text:

ddname The name of the data set that the APPC/MVS administration utility could not close is one of the following:

- SYSSDLIB
- SYSSDOUT
- SYSPRINT

rc The return code from the CLOSE macro (in decimal).

Source: APPC/MVS

System Action: The job fails.

User Response: If the data set is SYSSDLIB, it is the Virtual Storage Access Method (VSAM) key sequenced data set (KSDS) that contains the transaction program (TP) profile or side information entries. For information about closing a VSAM KSDS see *DFSMS/MVS Managing Catalogs*.

ATB335I **Warning - GENERIC_ID ignored.**

Explanation: The APPC/MVS administration utility encountered a generic userid being used for a standard transaction program (TP). Generic userids are for multi-trans TPs only.

Source: APPC/MVS

System Action: The system continues processing.

User Response: If necessary, correct the error and resubmit the request.

ATB336I **Warning - ")" expected following keyword value:**

Explanation: A keyword was entered without the closing parenthesis.

Source: APPC/MVS

System Action: The request continues with a closing parenthesis assumed after the keyword.

User Response: Message ATB301I follows this message showing the line with the missing closing parenthesis. If necessary, correct the line and resubmit the request.

ATB337I **Warning - Extra data on** *request* **line ignored:**

Explanation: The APPC/MVS administration utility encountered extra information on a request line. Each request must be on a line by itself.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The system continues processing.

User Response: If necessary, correct the error and resubmit the request.

ATB338I **Warning - No requests to process.**

Explanation: A job submitted for APPC/MVS administration utility processing was empty.

Source: APPC/MVS

System Action: The system continues processing.

User Response: If necessary, correct the error and resubmit the request.

ATB339I **Warning - No match found for the following TPSCHED_DELIMITER value:**

Explanation: The APPC/MVS administration utility found an end delimiter missing in the input while processing a request. The APPC/MVS administration utility requires an end delimiter to process the request.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process the request containing the error, but does process the next request, if one exists. The APPC/MVS administration utility issues message ATB301I after this message showing the start delimiter that is missing a matching end delimiter.

User Response: Add the end delimiter to the input and resubmit the request.

ATB340I Warning - Data following last ")" on line is ignored:

Explanation: The APPC/MVS administration utility encountered data after the last parenthesis on a line.

Source: APPC/MVS

System Action: The APPC/MVS administration utility continues processing but ignores the data. Message ATB301I follows this message showing the line with the extra data.

User Response: If necessary, correct the error and resubmit the request.

ATB341I Syntax checking of *request* begun.

Explanation: The APPC/MVS administration utility has started syntax checking for request *request*.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The system continues processing.

ATB342I Start of JCL messages.

Explanation: This message marks the start of the JCL messages for the APPC/MVS administration utility.

Source: APPC/MVS

Detecting Module: ATBSDFMR

System Action: The system continues processing.

ATB343I End of JCL messages.

Explanation: This message marks the end of the JCL messages for the APPC/MVS administration utility.

Source: APPC/MVS

Detecting Module: ATBSDFMR

System Action: The system continues processing.

User Response: If all preceding JCL messages for the APPC/MVS administration utility are informational, no action is necessary. Otherwise, correct any errors in the JCL and resubmit the request.

ATB345I *keyword* keyword must not be entered as part of Scheduler Data.

Explanation: The APPC/MVS administration utility encountered a keyword in the wrong place in the transaction program (TP) scheduler section of the request. See *OS/390 MVS Planning: APPC/MVS Management* for more information on the placement of keywords.

In the message text:

keyword The APPC/MVS administration utility found the ACTIVE keyword in the wrong place.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process the request containing the out of place keyword. Processing continues with the next request.

User Response: Correct the placement of the ACTIVE request and resubmit it.

ATB346I Error - GENERIC_ID required when TPSCHED_TYPE is MULTI-TRANS.

Explanation: An attempt was made to add a MULTI_TRANS transaction program (TP) Profile without giving a GENERIC_ID.

Source: APPC/MVS

System Action: The request fails.

User Response: Resubmit the request with a GENERIC_ID.

ATB347I Error - SYSTEM, USERID and GROUPID keywords are mutually exclusive.

Explanation: Two or more of the following mutually exclusive keywords have been entered:

- GROUPID
- SYSTEM
- USERID

Source: APPC/MVS

System Action: The request fails but the job continues processing.

User Response: Change the job to contain only one of the keywords.

ATB348I Required keyword(s) missing from *request* request.

Explanation: The APPC/MVS administration utility cannot process a request because one or more required keywords are missing.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

For example, SIADD requires the DESTNAME, MODENAME, PARTNER_LU, and TPNAME keywords. If any of these keywords is missing, message ATB348I is issued. For information on required keywords, see *OS/390 MVS Planning: APPC/MVS Management*.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process the request but continues processing with the next request.

User Response: Include the required keywords in the request and resubmit the job.

ATB349I Unrecognized line encountered:

Explanation: The APPC/MVS administration utility encountered unexpected input.

Source: APPC/MVS

System Action: The request fails but the job continues processing.

User Response: This message is followed by message ATB301I indicating the line in error. Correct the line and resubmit the request.

ATB350I Unrecognized keyword on *request* line:

Explanation: The APPC/MVS administration utility encountered an incorrect keyword while processing a request.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process this request but continues processing with the next request. Message ATB301I follows this message showing the line containing the incorrect keyword.

User Response: If necessary, correct the request containing the incorrect keyword and resubmit it.

ATB351I Operation expected - unrecognized line encountered:

Explanation: The APPC/MVS administration utility encountered unrecognized data on the first line of an APPC/MVS administration utility job. The first line of an APPC/MVS administration utility job has to be a request.

Source: APPC/MVS

System Action: The request fails, but processing continues with the next request. The APPC/MVS administration utility issues message ATB301I to display the unrecognized data.

User Response: Ensure that the first line in the APPC/MVS administration utility job is a request. Resubmit the job.

ATB352I *keyword* keyword must be entered as part of Scheduler Data.

Explanation: A keyword was entered outside of the Scheduler Data section of the transaction program (TP) Profile.

In the message text:

keyword The keyword that must be entered as part of Scheduler Data is one of the following:

- CLASS
- DATA_CLASS
- DATASET_STATUS
- GENERIC_ID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- STORAGE_CLASS
- TAILOR_SYSOUT
- TAILOR_ACCOUNT

Source: APPC/MVS

System Action: The request fails but the job continues processing.

User Response: Move the specified keyword to the Scheduler Data section by placing it between the TPSCHED_DELIMITER(*xxxx*) and the delimiter end.

ATB353I Maximum length allowed for *keyword* is *length*.

Explanation: Data given for the specified keyword exceeds the maximum allowable length.

In the message text:

keyword The keyword that was specified incorrectly is one of the following:

- ACTIVE
- CLASS
- DATA_CLASS
- DATASET_STATUS
- DBTOKEN
- DESTNAME
- GENERIC_ID
- GROUPID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNAME
- TPSCHED_EXIT
- TPSCHED_DELIMITER
- USERID

length The maximum allowable length for the keyword.

Source: APPC/MVS

System Action: The request fails but the job continues processing.

User Response: See *OS/390 MVS Planning: APPC/MVS Management* for information on the keyword. Correct the keyword and resubmit the request.

ATB354I Minimum length allowed for *keyword* is *length*.

Explanation: Data given for the specified keyword is shorter than the minimum allowable length.

In the message text:

keyword The keyword that was specified incorrectly is one of the following:

- ACTIVE
- CLASS
- DATA_CLASS
- DATASET_STATUS
- DBTOKEN
- DESTNAME
- GENERIC_ID
- GROUPID
- JCL_DELIMITER

- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNAME
- TPSCHED_EXIT
- TPSCHED_DELIMITER
- USERID

length The minimum allowable length for the keyword.

Source: APPC/MVS

System Action: The request fails. APPC/MVS administration utility processing continues.

User Response: See *OS/390 MVS Planning: APPC/MVS Management* for information on the keyword. Correct the keyword and resubmit the request.

ATB355I Keyword value is not valid for *keyword* keyword:

Explanation: The data given for the specified keyword is not valid.

In the message text:

keyword The keyword that was specified incorrectly is one of the following:

- ACTIVE
- CLASS
- DATA_CLASS
- DATASET_STATUS
- DBTOKEN
- DESTNAME
- GENERIC_ID
- GROUPID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- SYSTEM
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNAME
- TPSCHED_EXIT
- TPSCHED_DELIMITER
- TPSCHED_TYPE
- USERID

Source: APPC/MVS

System Action: The request fails but the job continues processing.

User Response: Correct the keyword and resubmit the request. Refer to *OS/390 MVS Planning: APPC/MVS Management* for a description of the allowable data for the specified keyword.

ATB356I Duplicate entry found for *keyword* keyword.

Explanation: The APPC/MVS administration utility encountered the specified keyword twice.

In the message text:

keyword The keyword that was encountered twice is one of the following:

- ACTIVE
- CLASS
- DATA_CLASS
- DATASET_STATUS
- DBTOKEN
- DESTNAME
- GENERIC_ID
- GROUPID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- SYSTEM
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNAME
- TPSCHED_EXIT
- TPSCHED_DELIMITER
- USERID

Source: APPC/MVS

System Action: The request fails. The APPC/MVS administration utility continues processing the job.

User Response: Remove one of the duplicate keywords. Resubmit the request.

ATB357I Keyword not recognized for *request* request:

Explanation: The APPC/MVS administration utility encountered a keyword that is incorrect for the given request.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The request fails. The APPC/MVS administration utility continues processing the job. The system issues message ATB301I showing the keyword that is incorrect.

User Response: Refer to *OS/390 MVS Planning: APPC/MVS Management* for the expected keywords for requests. Correct the syntax of the request and resubmit it.

ATB358I *keyword* keyword may not have an associated parameter:

Explanation: The APPC/MVS administration utility encountered a keyword with an associated parameter. The keyword may not have an associated parameter.

In the message text:

keyword The keyword in error is the SYSTEM keyword.

Source: APPC/MVS

System Action: The request fails. The APPC/MVS administration utility continues processing the job. The system issues message ATB301I showing the keyword that is incorrect.

User Response: Refer to *OS/390 MVS Planning: APPC/MVS Management* for the correct syntax for the SYSTEM keyword. Correct the syntax of the request and resubmit it.

ATB360I Failed to locate Alternate Transaction Scheduler Exit: *module*

Explanation: While processing a TPADD or TPMODIFY request of a non-ASCH transaction program (TP) Profile, the system could not locate the alternate transaction scheduler exit specified with the TPSCHED_EXIT keyword.

In the message text:

module The name of the alternate transaction scheduler exit that could not be found.

Source: APPC/MVS

System Action: The request fails. The APPC/MVS administration utility continues processing the job.

User Response: Ensure that the alternate transaction scheduler exit is not misspelled. Contact the system programmer for further help.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB361I Alternate Transaction Scheduler Exit is not authorized: *module***.**

Explanation: The alternate transaction scheduler exit specified with the TPSCHED_EXIT keyword is not authorized.

The transaction scheduler exit must meet all the following conditions:

- Reside in LPA or in the LINKLIST concatenation (for example, SYS1.LINKLIB)
- Be in an APF-authorized STEPLIB
- Be linkedited with attributes reusable and reentrant.

In the message text:

module The name of the alternate transaction scheduler exit

Source: APPC/MVS

System Action: The request fails but the job continues processing.

User Response: Contact the system programmer for assistance.

ATB362I TP ALIAS already exists.

Explanation: The APPC/MVS administration utility encountered a transaction program (TP) alias that was already in use for this TP NAME.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not add the requested alias for this TP name but continues processing the rest of the job.

User Response: If necessary, choose another alias for this TP name.

ATB363I Severe error returned from APPC administration utility.

Explanation: The APPC/MVS administration utility encountered an internal error.

Source: APPC/MVS

System Action: The job fails, but the APPC administration tries processing the next job. The system issues an SVC dump.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

ATB364I TP profile already exists.

Explanation: The APPC/MVS administration utility encountered a request to add a transaction program (TP) profile for a TP name and level that already exists.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not add the requested TP profile. Processing continues with the next request.

User Response: Determine why there are two TP profiles with the same name and level. If necessary, choose a different name for the TP profile you are trying to add and resubmit the request.

ATB365I Side information already exists.

Explanation: The APPC/MVS administration utility encountered a request to add a side information entry that already exists to a side information file.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not add the requested side information destination name. Processing continues with the next request.

User Response: Determine why there are two identical side information entries for this side information data set. If necessary, choose a different side information destination name and resubmit the request.

ATB366I Syntax error in TP profile JCL.

Explanation: The APPC/MVS administration utility found an error in the JCL for the transaction program (TP) profile.

Source: APPC/MVS

System Action: The APPC/MVS administration utility issues messages ATB320I and ATB321I to show the start and end of the statement image records containing the JCL error. The APPC/MVS administration utility does not process this request but continues processing with the next request.

User Response: Look in the statement image records for the JCL error. Correct the error and resubmit the job.

ATB367I TP profile not added, dataset full.

Explanation: The APPC/MVS administration utility cannot add a requested transaction program (TP) profile to the TP profile data set. This problem is caused by one of the following:

- The TP profile data set is already full.
- The TP profile data set will be too full if the APPC/MVS administration utility adds this TP profile to the data set.
- The number of records for this TP profile exceeds the maximum limit defined for this TP profile data set.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not add the requested TP profile to the data set. Processing continues with the next request.

User Response: Do the following:

1. Look at the data set definition for the TP profile data set. Check to see whether the number of records for the requested TP profile exceeds the maximum. See *OS/390 MVS Planning: APPC/MVS Management* for more information.
2. If the record length of the requested TP profile fits the data set definition, use the REPRO command to copy the VSAM KSDS containing the TP profile data set into a larger object. For more information on the REPRO command, see *DFSMS/MVS Access Method Services for ICF*. Then resubmit the job using the larger VSAM KSDS.

ATB368I Side information not added, dataset full.

Explanation: The APPC/MVS administration utility cannot add the requested side information. Either the side information file is already full or would be full if the APPC/MVS administration utility adds this entry.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not add the requested side information to the data set. Processing continues with the next request.

User Response: Use the REPRO command to copy the VSAM KSDS containing the side information file into a larger object. For more information on the REPRO command, see *DFSMS/MVS Access Method Services for ICF*. Then resubmit the request using the larger VSAM KSDS.

ATB369I Insufficient authority to perform *request*.

Explanation: The APPC/MVS administration utility found that the user had no Resource Access Control Facility (RACF) authority to perform the request on this transaction program (TP) profile or side information.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User Response: If it is necessary to perform the request on this TP profile or side information, see your RACF administrator.

ATB370I Second TP profile name specified is an alias.

Explanation: The APPC/MVS administration utility encountered a request to add an alias for a transaction program (TP) name that is already an alias. You cannot have an alias for an alias.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User Response: Find out what the second TP profile name is an alias for using the TPRETRIEVE request.

ATB371I Specified TP profile not found.

Explanation: The APPC/MVS administration utility could not find the transaction program (TP) name specified in a request. This can be due to one of the following errors:

- The TP name is misspelled in the TP profile
- The APPC/MVS administration utility job specified the wrong TP profile data set
- This TP name does not exist

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User Response: Submit a TPKEYS request to retrieve all the TP names defined in this data set. If necessary, resubmit the request using a correct TP name.

ATB372I Specified side information not found.

Explanation: The APPC/MVS administration utility could not find the side information destination name specified in a request. This can be due to one of the following errors:

- The side information destination name was misspelled
- The APPC/MVS administration utility job specified the wrong side information file
- This side information destination name does not exist

System Action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User Response: Submit a SIKEYS request to find the entries defined in this data set. If necessary, correct the error and resubmit the request.

ATB374I The TP profile is registered for test.

Explanation: During processing of a TPDELETE request, the APPC/MVS administration utility found that the transaction program (TP) profile is registered for the Time Sharing Option Extensions (TSO/E) TEST command. The APPC/MVS administration utility cannot delete the TP profile until it is unregistered.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process this request, but continues processing with the next request.

User Response: Ensure that the TP profile is unregistered and then resubmit the request to delete it.

ATB375I TPMODIFY of an alias TP profile is not allowed.

Explanation: The APPC/MVS administration utility could not process a TPMODIFY request to modify an alias transaction program (TP) profile. You cannot modify an alias TP profile name. A TPMODIFY is only valid for the TP profile itself.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process this request, but continues processing with the next request.

User Response: Change the TPMODIFY request to modify the TP profile rather than the alias and resubmit the request.

ATB376I SCHED_EXIT may not be changed from non-ASCH to ASCH.

Explanation: The APPC/MVS administration utility encountered a TPMODIFY request that is not valid. You cannot use a TPMODIFY request to change the scheduler for a TP profile.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User Response: Delete the TP profile and then submit a TPADD request with the new scheduler name for this TP profile.

ATB378E Error getting APPC administration utility storage - Getmain RC: *rc***.**

Explanation: The APPC/MVS administration utility encountered an error while attempting to obtain storage.

In the message text:

rc The return code from the GETMAIN macro (in decimal).

Source: APPC/MVS

System Action: The APPC/MVS administration utility job ends.

Operator Response: Notify the system programmer. Obtain an ABEND dump.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the ABEND dump and the GETMAIN macro return code.

ATB380E APPC admin. utility error - Keyword table contains unknown type for *keyword***.**

Explanation: An internal error has occurred in the APPC administration utility.

Source: APPC/MVS

System Action: The request fails. The APPC/MVS administration utility continues processing the job.

User Response: Obtain an ABEND dump if possible. Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the ABEND dump, if available.

ATB381E No match found for the following *delimiter_type* **value:**

Explanation: The APPC/MVS administration utility found a delimiter missing in the input while processing a request. The APPC/MVS administration utility cannot process the request without the missing delimiter.

In the message text:

delimiter_type The delimiter missing from the input can be one of the following types:

TPSCHED_DELIMITER Marks the start and end of scheduler statements in the input.

JCL_DELIMITER Marks the start and end of the JCL in the input.

Source: APPC/MVS

System Action: The APPC/MVS administration utility does not process the request containing the error, but does process the next request, if one exists. The APPC/MVS administration utility issues message ATB301I after this message showing the JCL delimiter that is missing its matching delimiter.

User Response: Add the missing JCL delimiter to the TP profile JCL and resubmit the request.

ATB383E Unknown error from APPC administration utility for *request* **: RC =** *rc***.**

Explanation: The APPC/MVS administration utility encountered an internal error.

In the message text:

request The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

rc The reason code for the error.

Source: APPC/MVS

System Action: The job fails, but processing continues with the next job. The system issues an SVC dump.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the text of this message.

ATB384E APPC admin. utility error - unexpected output returned for keyword *keyword***.**

Explanation: The APPC/MVS administration utility encountered an internal error.

In the message text:

keyword The APPC/MVS administration utility keyword found is one of the following:

- ACTIVE
- CLASS
- DATA_CLASS
- DATASET_STATUS
- DBTOKEN
- DESTNAME
- GENERIC_ID
- GROUPID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- SYSTEM
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNAME
- TPSCHED_EXIT
- TPSCHED_DELIMITER
- TPSCHED_TYPE
- USERID

Source: APPC/MVS

System Action: The job fails, but processing continues with the next job. The system issues an SVC dump.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

ATB386E APPC administration utility error - keyword not recognized:

Explanation: The APPC/MVS administration utility encountered an internal error.

Source: APPC/MVS

System Action: The job fails, but processing continues with the next job. The APPC/MVS administration utility issues message ATB301I after this message to display the unrecognized data where a keyword was expected. The system issues an SVC dump.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the text of message ATB301I.

ATB389E Error opening *ddname* file.

Explanation: The APPC/MVS administration utility encountered an error while trying to open a data set.

In the message text:

ddname The name of the data set that the APPC/MVS administration utility could not open is one of the following:

- SYSSDLIB
- SYSSDOUT
- SYSPRINT

Source: APPC/MVS

System Action: The job fails.

User Response: If the data set is SYSSDLIB, it is the Virtual Storage Access Method (VSAM) key sequenced data set (KSDS) that contains the transaction program (TP) profile or side information entries. For information about opening a VSAM KSDS, see *DFSMS/MVS Access Method Services for ICF*.

ATB390E Required *ddname* file is not allocated.

Explanation: The APPC/MVS administration utility could not allocate a data set.

In the message text:

ddname The name of the data set that the APPC/MVS administration utility could not allocate is one of the following:

- SYSSDLIB
- SYSSDOUT
- SYSPRINT

Source: APPC/MVS

System Action: The job fails.

User Response: This problem may be due to a typographical error. Check the data set names in the job stream. Otherwise, notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB391E Allocation for SYSSDLIB failed. Reason Code = *rc*.

Explanation: The APPC/MVS administration utility encountered an internal error.

In the message text:

rc The return code from SVC 99 (in decimal).

Source: APPC/MVS

System Action: The job fails.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB392E Error reading record from dataset: *ddname*.

Explanation: The APPC/MVS administration utility encountered an error while trying to read from a data set.

In the message text:

ddname The name of the data set from which the APPC/MVS administration utility could not read is one of the following:

- SYSSDLIB
- SYSSDOUT
- SYSPRINT

Source: APPC/MVS

System Action: The job fails.

User Response: If the name of the data set is SYSSDLIB, ensure that the keyed sequential data set (KSDS), to which SYSSDLIB is pointing, is not corrupted.

Issue the DIAGNOSE command to determine the error. For more information, see *DFSMS/MVS Managing Catalogs*.

ATB393E Error writing to dataset: *ddname*.

Explanation: The APPC/MVS administration utility encountered an error while trying to write to a data set.

In the message text:

ddname The name of the data set to which the APPC/MVS administration utility could not write is one of the following:

- SYSSDLIB
- SYSSDOUT
- SYSPRINT

Source: APPC/MVS

System Action: The job fails.

User Response: If the name of the data set is SYSSDLIB, make sure that the keyed sequential data set (KSDS), to which SYSSDLIB is pointing, is not corrupted.

Issue the DIAGNOSE command to determine the error. For more information, see *DFSMS/MVS Managing Catalogs*.

ATB394E APPC administration utility error - I/O action requested is not valid: *action***.**

Explanation: The APPC/MVS administration utility encountered an I/O error.

In the message text:

action The requested I/O action that failed, one of the following:

I Read-type operation

O Write-type operation

Source: APPC/MVS

System Action: The job fails. The system issues other messages further describing the error.

User Response: Follow the user response(s) in the accompanying message(s).

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB396E Error loading *module* **- Module Load RC:** *rc***.**

Explanation: An error occurred while trying to load the alternate transaction scheduler exit.

In the message text:

module The module that could not be loaded.

rc The return code from the LOAD macro (in decimal).

Source: APPC/MVS

System Action: The request fails. The APPC/MVS administration utility continues processing the job.

User Response: Contact the system programmer for assistance.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB397E ATBSDFMU input PARM not recognized: TYPRUN.

Explanation: An input parameter on the TYPRUN statement was not recognized. The parameter must be one of the following:

- APPC
- RUN
- SCAN

RUN is the default if no parameter is specified.

Source: APPC/MVS

System Action: The system continues processing.

User Response: Put a valid parameter on the TYPRUN statement. Resubmit the job.

ATB400I APPC/MVS TEST SERVICES UNAVAILABLE. REASON= *xxxxxxxx***.**

Explanation: Because errors occurred in the test services initialization process, test services will not be available until the next time Advanced Program-to-Program Communication (APPC) is started.

In the message text:

xxxxxxxx The reason code.

Source: APPC/MVS

Detecting Module: ATBTEIT

System Action: The system continues processing without test services.

Operator Response: Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ATB498I API TRACES STARTED WITH THE DATA SET *dsname* **IN USE BY** *user* **WERE STOPPED BECAUSE OF A SEVERE INTERNAL ERROR**

Explanation: The system encountered a severe error while processing an application program interface (API) trace record, and stopped the trace. Any API trace entries that were collected but not written to the data set might be lost. The error might be an I/O error, or an error in APPC/MVS.

In the message text:

dsname The data set for which all the API traces were stopped.

user The user ID under which the ATBTRACE START request was issued for this data set.

Source: APPC/MVS

Detecting Module: ATBVSTW

System Action: The system stops all active API traces associated with the data set. For an I/O error, the system issues messages with the prefix AHL, IEC, or IOS, along with this message. If no AHL, IEC, or IOS messages accompany ATB498I, the error is in APPC/MVS, and the system issues a dump of the APPC address space.

Operator Response: Provide the system programmer with the dump or the I/O-related error messages. If possible, notify the user of the data set that API tracing activity has stopped.

System Programmer Response: If an I/O error was encountered, follow the instructions for the accompanying AHL, IEC, or IOS messages to correct the problem. Otherwise, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center, and provide the dump.

Application Programmer Response: If API tracing is still required, submit the ATBTRACE START request again. If an I/O error was encountered for the data set, allocate another data set on a different device and resubmit the ATBTRACE START request, specifying the name of the new data set.

ATB499I APPC/MVS TRACE ROUTINE IS NOT AVAILABLE BECAUSE OF AN APPC/MVS INTERNAL ERROR. ANY ACTIVE API TRACES WERE STOPPED.

Explanation: The system encountered a severe error while processing an ATBTRACE START or STOP request. APPC/MVS is not able to continue processing application program interface (API) trace requests because it has brought down the trace routine.

Source: APPC/MVS

Detecting Module: ATBVSTT

System Action: The system stops all active API traces for all data sets, and requests a dump of the APPC address space.

Operator Response: Provide the system programmer with the dump. If requested by the system programmer, bring down the APPC address space and restart APPC.

System Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center, and provide the dump. If API tracing is still required, ask the operator to bring down the APPC address space and restart APPC.

ATB500E APPC INTERNAL ERROR. REASON CODE=*rc*

Explanation: An internal error occurred.

In the message text:

rc A reason code associated with the error.

Source: APPC/MVS

System Action: The system issues an SVC dump. The system continues processing.

Operator Response: Delete the current logical units. This action will prevent any new transaction programs (TPs) from entering the system while the TPs in progress quiesce. Once all the TPs have quiesced, restart APPC.

System Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the reason code issued in this message.

ATR Messages

ATR001I SYSRRS COMPONENT TRACE OPTIONS ERROR. EXPECTED *expected* **BEFORE** *seen*

Explanation: The OPTIONS keyword provided on the TRACE command contained syntax errors.

In the message text:

expected
is text that should have been specified.

seen
is the last recognized text.

Source: Resource recovery services (RRS)

Detecting Module: ATRVMLEX

System Action: RRS continues processing, but the SYSRRS component trace is not started.

Operator Response: Correct any syntax errors in the OPTIONS keyword and issue the TRACE command again.

System Programmer Response: If component trace messages (prefix ITT) accompany this message, see the system programmer response for the ITT messages.

ATR002I SYSRRS COMPONENT TRACE OPTIONS ERROR. FOUND *keyword* **INSTEAD OF ONE OF THESE EXPECTED KEYWORDS:** *keyword1 keyword2 keyword3 keyword4 keyword5 keyword6 keyword7 keyword8 keyword9 keyword10*

Explanation: The operator issued the TRACE command to request RRS component tracing, but none of the expected keywords were found. The following list identifies keywords that might appear in the message and the kind of data expected:

NAME	Resource manager name was expected
LUWID	Logical unit of work identifier was expected
USER	User identifier was expected
END_OF_FILE	Indicates that text was found beyond the expected end of the input string.

In the message text:

keyword
is the text that was found.

keyword1...keyword10
is an expected keyword.

Source: Resource recovery services (RRS)

Detecting Module: ATRVMLEX

System Action: RRS processing continues, but the SYSRRS component trace is not started.

Operator Response: Correct any syntax errors in the OPTIONS keyword and issue the TRACE command again.

System Programmer Response: If component trace messages (prefix ITT) accompany this message, see the system programmer response for the ITT messages.

ATR003I SYSRRS COMPONENT TRACE FAILED DUE TO A SERVICE ERROR.

Explanation: RRS was unable to activate its component trace because it encountered an error in one of the services it uses.

Source: Resource recovery services (RRS)

Detecting Module: ATRVMINT

System Action: RRS initialization continues, but the SYSRRS component trace is not active. A symptom record is written to capture the error.

Operator Response: If the SYSRRS component trace is required, use SETRRS CANCEL to cancel RRS, then restart it. Notify the system programmer.

System Programmer Response: If the problem recurs, provide the symptom record to the IBM Support Center.

ATR004I SYSRRS COMPONENT TRACE FAILED USING PARMLIB MEMBER *member*, **RC=***ctracerc* **RSN=***ctracersn*. **USING DEFAULT OPTIONS.**

Explanation: RRS was unable to activate its component trace using the parmlib member named in the message.

In the message text:

member
is the name of the CTnRRSxx parmlib member name that contains SYSRRS component trace options.

ctracerc
is the return code from the CTRACE DEFINE macro.

ctracersn
is the reason code from the CTRACE DEFINE macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRVMINT

System Action: RRS tries to activate its component trace using default component options.

Operator Response: None

System Programmer Response: Verify that the specified parmlib member exists and contains no syntax errors. For explanation of the return and reason codes, see the description of the CTRACE macro in *OS/390 MVS Programming: Authorized Assembler Services Reference ALE-DYN*. If the parmlib member is correct, provide this message text to the IBM Support Center.

ATR005I SYSRRS COMPONENT TRACE FAILED USING DEFAULT OPTIONS, RC=*return-code* **RSN=***reason-code*

Explanation: RRS was unable to activate its component trace using the default options.

In the message text:

return-code
is the return code from the CTRACE DEFINE macro.

reason-code
is the reason code from the CTRACE DEFINE macro .

Source: Resource recovery services (RRS)

Detecting Module: ATRVMINT

© Copyright IBM Corp. 1988, 1999

System Action: RRS initialization continues without the SYSRRS component trace support.

Operator Response: None

System Programmer Response: Provide this message text to the IBM Support Center. For explanation of the return and reason codes, see the description of the CTRACE macro in *OS/390 MVS Programming: Authorized Assembler Services Reference ALE-DYN*.

ATR006I SYSRRS COMPONENT TRACE START FAILED, MAXIMUM NUMBER OF RESOURCE MANAGER NAMES EXCEEDED.

Explanation: The OPTIONS parameter (in the CTnRRSxx parmlib member or the reply for a TRACE command) provided more than 16 resource manager names.

Source: Resource recovery services (RRS)

Detecting Module: ATRVMRMN

System Action: RRS processing continues, but the SYSRRS component trace is not started.

Operator Response: If the TRACE command was used to start the SYSRRS component trace, reduce the list of resource manager names to 16 and issue the TRACE command again.

System Programmer Response: If a parmlib member was used to start the SYSRRS component trace, reduce the list of resource manager names to 16, then issue the TRACE command again.

ATR007I SYSRRS COMPONENT TRACE START FAILED, MAXIMUM NUMBER OF LUWIDS EXCEEDED.

Explanation: The OPTIONS parameter (in the CTnRRSxx parmlib member or the reply for a TRACE command) provided more than 16 logical unit of work identifiers (LUWIDs).

Source: Resource recovery services (RRS)

Detecting Module: ATRVMLID

System Action: RRS processing continues, but the SYSRRS component trace is not started.

Operator Response: If the TRACE command was used to start the SYSRRS component trace, reduce the list of LUWIDs to 16 and issue the TRACE command again to start the SYSRRS component trace.

System Programmer Response: If a parmlib member was used to start the component trace, reduce the list of LUWIDs to 16, then issue the TRACE command again.

ATR008I SYSRRS COMPONENT TRACE START FAILED, MAXIMUM NUMBER OF USERIDS EXCEEDED.

Explanation: The OPTIONS parameter (in the CTnRRSxx parmlib member or the reply for a TRACE command) provided more than 16 user identifiers.

Source: Resource recovery services (RRS)

Detecting Module: ATRVMUID

System Action: RRS processing continues, but the SYSRRS component trace is not started.

Operator Response: If the TRACE command was used to start the SYSRRS component trace, reduce the list of USERIDs to 16 and issue the TRACE command again to start the SYSRRS component trace.

System Programmer Response: If a parmlib member was used to start the component trace, reduce the list of USERIDs to 16, then issue the TRACE command again.

ATR010I SYSRRS COMPONENT TRACE START FAILED, MAXIMUM NUMBER OF EIDS EXCEEDED.

Explanation: The OPTIONS parameter (in the CTnRRSxx parmlib member or the reply for a TRACE command) provided more than 16 Enterprise identifiers (EIDs).

Source: Resource recovery services (RRS)

Detecting Module: ATRVMEID

System Action: RRS processing continues, but the SYSRRS component trace is not started.

Operator Response: If the TRACE command was used to start the SYSRRS component trace, reduce the list of EIDs to 16 and issue the TRACE command again to start the SYSRRS component trace.

System Programmer Response: If a parmlib member was used to start the component trace, reduce the list of EIDs to 16, then issue the TRACE command again.

ATR011I SYSRRS COMPONENT TRACE FAILED DUE TO AN RRS INTERNAL ERROR.

Explanation: RRS was unable to activate its component trace because it encountered an internal error.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRVMINT

System Action: RRS initialization continues, but the SYSRRS component trace is not active. A dump was taken to capture the error.

Operator Response: If the SYSRRS component trace is required, use SETRRS CANCEL to cancel RRS and then restart it. Notify the system programmer.

System Programmer Response: If the problem recurs, provide the symptom record to your IBM Support Center.

ATR101I CANCEL REQUEST WAS RECEIVED FOR RRS.

Explanation: The system has received the SETRRS CANCEL command the operator issued and is now processing the request.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMSFR

System Action: SETRRS CANCEL processing continues with syntax verification.

Operator Response: None.

System Programmer Response: None.

ATR102I SETRRS OPTIONS SYNTAX ERROR. EXPECTED *expected* **BEFORE** *known*

Explanation: The SETRRS command contains text that RRS does not recognize as valid input.

In the message text:

expected
is the expected input.

known
is the last known text.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMSLA

System Action: The SETRRS command is not processed.

Operator Response: Correct the syntax and issue the SETRRS command again.

System Programmer Response: None

ATR103I SETRRS OPTIONS SYNTAX ERROR. FOUND *keyword* INSTEAD OF ONE OF THESE EXPECTED KEYWORDS: *keyword1 keyword2 keyword3*

Explanation: The operator issued the SETRRS CANCEL command, but the command did not contain an expected keyword.

In the message text:

keyword
is the text that was found.

keyword1...keyword3
is an expected keyword.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMSLA

System Action: The system rejects the SETRRS command. RRS remains active.

Operator Response: Correct the syntax and issue the SETRRS command again.

System Programmer Response: None

ATR120I RRS LOGSTREAM DISCONNECT HAS FAILED FOR LOGSTREAM: *logstreamname*. RC=*return-code*, RSN=*reason-code*

Explanation: When trying to disconnect from the specified log stream. RRS encountered an error.

In the message text:

logstreamname
is the name of the log stream in error.

return-code
is the return code from the IXGCONN macro.

reason-code
is the last encountered reason code from the IXGCONN macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMSFR

System Action: RRS processing continues; it remains connected to the specified log stream.

Operator Response: Inform the system programmer.

System Programmer Response: Verify that the specified log stream has been correctly defined. If the error disconnecting from it is expected based upon other related system events that indicate similar errors encountered with this log stream, no action might be needed. Otherwise, provide this information to your IBM Support Center.

ATR121I SETRRS CANCEL HAS FAILED. CALLRTM RC=*return-code*

Explanation: When trying to stop the RRS address space, SETRRS CANCEL processing has encountered an error.

In the message text:

return-code
is the return code value from the CALLRTM macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMSFR

System Action: SETRRS CANCEL processing is ended. RRS remains active.

Operator Response: Inform the system programmer.

System Programmer Response: For an explanation of the return code, see the description of CALLRTM in *OS/390 MVS Programming: Authorized Assembler Services Reference ALE-DYN*. Contact your IBM Support Center.

ATR130I RRS LOGSTREAM CONNECT HAS FAILED FOR MANDATORY LOGSTREAM *logstreamname*. RC=*return-code*, RSN=*reason-code*

Explanation: RRS initialization has encountered an error connecting to the named log stream, which is required for normal RRS processing.

In the message text:

logstreamname
is the log stream in error.

return-code
is the return code from the IXGCONN macro.

reason-code
is the most recent reason code from the IXGCONN macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS, which cannot function without this log stream, stops its initialization process. The RRS address space is therefore not available for use.

Operator Response: Contact the system programmer for help with solving the problem.

System Programmer Response: For an explanation of the return and reason codes, see the description of IXGCONN in *OS/390 MVS Programming: Assembler Services Reference*. Verify that all RRS log streams are defined correctly. If necessary, redefine the log streams correctly and reissue the START command for RRS.

ATR131I RRS RESTART DENIED - RRS IS ALREADY ACTIVE

Explanation: RRS initialization has determined that an RRS subsystem is already active on this MVS image. This message appears only when the name of the newly started RRS subsystem does not match that of the currently active RRS subsystem.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: Initialization of the new RRS subsystem is ended. The current RRS subsystem continues processing.

Operator Response: If possible, use the currently active RRS subsystem. If you do need to stop the current subsystem, issue the SETRRS CANCEL command. If the RRS subsystem was already cancelled via the SETRRS CANCEL command, RRS termination may be delayed. Check SYSLOG for an ATR167I message that is issued when RRS termination completes. If this message is not found, check SYSLOG for messages ATR165I and ATR166I. If you find an ATR165I without an ATR166 that has the same ASID and JOBNAME, RRS is waiting for SRB exits in that space to be purged. You can CANCEL/FORCE that space to allow RRS termination to continue. Contact the system programmer for help with solving the problem.

System Programmer Response: Verify any required operator actions.

ATR132I RRS LOGSTREAM CONNECT HAS FAILED FOR OPTIONAL LOGSTREAM *logstreamname***. RC=***return-code***, RSN=***reason-code*

Explanation: RRS initialization cannot connect to the specified optional log stream.

In the message text:

logstreamname
is the name of the log stream that RRS tried to connect to.

return-code
is the most recent return code from the IXGCONN macro.

reason-code
is the most recent reason code from the IXGCONN macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization continues without the optional log stream.

Operator Response: None.

System Programmer Response: For an explanation of the return and reason codes, see the description of IXGCONN in *OS/390 MVS Programming: Assembler Services Reference*. Verify that all RRS log streams are defined correctly. Take any steps required to ensure that the problem does not recur.

ATR133I RRS COULD NOT REGISTER AS A RESOURCE MANAGER. RC=*return-code*

Explanation: RRS initialization cannot register itself as a resource manager.

In the message text:

return-code
is the most recent return code for the Register_Resource_Manager callable service.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization stops. The RRS address space is not available for use.

Operator Response: Inform your system programmer.

System Programmer Response: For an explanation of the return code from the service, see the description of Register_Resource_Manager in *OS/390 MVS Programming: Resource Recovery*. Provide the information to your IBM Support Center.

ATR134I RRS COULD NOT REGISTER AS AN EXIT MANAGER. RC = *return-code*

Explanation: RRS initialization cannot register itself as an exit manager.

In the message text:

return-code
is the return code from the Set_Exit_Information service.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization is stopped. The RRS address space is not available for use.

Operator Response: Inform your system programmer.

System Programmer Response: For an explanation of the return code from the service, see the description of Set_Exit_Information in *OS/390 MVS Programming: Resource Recovery*. Provide this information to your IBM Support Center.

ATR135I RRS RESMGR COULD NOT BE ESTABLISHED, RESMGR RC = *return-code*

Explanation: RRS initialization cannot establish the RTM resource manager routine it needs to monitor the RRS address space.

In the message text:

return-code
is the return code from the RESMGR macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization backs out all processing and brings down the RRS address space. RRS is not available.

Operator Response: Contact your system programmer.

System Programmer Response: For an explanation of the return code, see the description of the RESMGR macro in *OS/390 MVS Programming: Authorized Assembler Services Reference LLA-SDU*. Provide the information to your IBM Support Center.

ATR137I RRS ATTEMPT TO SET EXITS WITH CONTEXT SERVICES HAS FAILED, RC = *return-code*

Explanation: RRS initialization, having registered RRS as both a resource manager and an exit manager, cannot set exits for RRS.

In the message text:

return-code
is the return code from the Set_Exit_Information service.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization backs out all processing and brings itself down.

Operator Response: Notify the system programmer. Examine the return code to determine the error. If it is correctable, correct it and restart RRS. If it is not correctable, inform the system programmer.

System Programmer Response: For an explanation of the return code, see the description of Set_Exit_Information in *OS/390 MVS Programming: Resource Recovery*. Determine if the error is correctable and, if so, correct it and restart RRS. Otherwise, contact your IBM Support Center.

ATR138I ATTEMPT TO BRING UP RRS FAILED, DIAG =*return-code*

Explanation: RRS initialization cannot activate RRS because of an internal system error.

In the message text:

return-code
is IBM internal diagnostic information

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization backs out all processing and brings RRS down.

Operator Response: Contact your system programmer.

System Programmer Response: Provide this information to your IBM Support Center.

ATR139I RRS WAS UNABLE TO REGISTER FOR AUTOMATIC RESTART. RC = *return-code*, **RSN =** *reason-code*

Explanation: RRS initialization was unable to register with the automatic restart manager.

In the message text:

return-code
is the return code from the IXCARM macro.

reason-code
is the reason code from the IXCARM macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization continues, but the automatic restart manager will not restart RRS if RRS fails.

Operator Response: Notify the system programmer.

System Programmer Response: For an explanation of the return and reason codes, see the description of IXCARM in *OS/390 MVS Programming: Sysplex Services Reference*. Examine the return and reason codes to determine the problem. If you need automatic restart and you can fix the problem, use the SETRRS CANCEL command to stop RRS, fix the problem, and then restart RRS. If you cannot fix the problem, contact your IBM Support Center.

ATR140I RRS READY ATTEMPT FOR ARM HAS FAILED, RC = *return-code*, **RSN =** *reason-code*

Explanation: RRS was unable to mark itself with the automatic restart manager as ready to receive work.

In the message text:

return-code
is the return code from the IXCARM macro.

reason-code
is the reason code from the IXCARM macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization continues, but the automatic restart manager will not restart RRS if RRS fails.

Operator Response: Notify the system programmer.

System Programmer Response: For an explanation of the return and reason codes, see the description of IXCARM in *OS/390 MVS Programming: Sysplex Services Reference*. Examine the return and reason codes to determine the problem. If you need automatic restart and you can fix the problem, use the SETRRS CANCEL command to stop RRS, fix the problem, and then restart RRS. If you cannot fix the problem, contact your IBM Support Center.

ATR141I RRS WILL NOT AUTOMATICALLY RESTART.

Explanation: The automatic restart manager will not restart RRS if RRS fails.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: Message ATR139I or ATR140I accompanies this message. RRS initialization continues, but the automatic restart manager will not restart RRS if it fails.

Operator Response: Notify the system programmer.

System Programmer Response: Respond as described for the message that accompanies this message.

ATR142I RRS WAS UNABLE TO DEREGISTER FROM ARM, RC = *return-code*, **RSN =** *reason-code*

Explanation: SETRRS CANCEL processing tried to deregister itself from the automatic restart manager but was unable to do so.

In the message text:

return-code
is the return code from the IXCARM macro.

reason-code
is the reason code from the IXCARM macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMSFR

System Action: RRS cancel processing continues.

Operator Response: None.

System Programmer Response: Provide this information to your IBM Support Center.

ATR143I RRS HAS BEEN DEREGISTERED FROM ARM.

Explanation: RRS has been deregistered from the automatic restart manager.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS continues processing; if the RRS address space comes down, it will not be automatically restarted.

Operator Response: None.

System Programmer Response: Examine any accompanying messages. If these messages indicate that the automatic restart manager is not available and that RRS is still available, determine if you need automatic restart. If so, either wait for automatic restart manager to become available, or take action to make it available, as determined by the response to other accompanying messages related to the automatic restart manager. Once the automatic restart manager is available, issue the SETRRS CANCEL command to stop RRS, followed by the START command to restart RRS.

ATR144I RRS ENF TYPE 48 LISTENER EXIT COULD NOT BE ESTABLISHED, RC = *return-code*

Explanation: RRS could not establish a type 48 listener exit to monitor system logger events.

In the message text:

return-code
is the return code from the ENFREQ macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS stops the RRS address space because the ENF type 48 listener exit is essential to the use of all RRS log streams.

Operator Response: Notify your system programmer.

System Programmer Response: Provide this information to the IBM Support Center. For an explanation of the code, see the description of ENFREQ in *OS/390 MVS Programming: Authorized Assembler Services Reference ENF-IXG*.

ATR145I RRS ENF TYPE 38 LISTENER EXIT COULD NOT BE ESTABLISHED, RC = *return-code*

Explanation: RRS could not establish a type 38 listener exit to monitor automatic restart manager events.

In the message text:

return-code
is the return code from the ENFREQ macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS continues processing without the listener exit. If, however, the automatic restart manager fails, RRS will be implicitly deregistered from the automatic restart manager. If the RRS address space ends unexpectedly, it will not be automatically restarted.

Operator Response: None.

System Programmer Response: Provide this information to your IBM Support Center. For an explanation of the code, see the description of ENFREQ in *OS/390 MVS Programming: Authorized Assembler Services Reference ENF-IXG*.

ATR149I RRS INITIALIZATION HAS FAILED. SYSTEM LOGGER IS UNAVAILABLE FOR THIS IPL.

Explanation: In its attempt to connect to log streams, RRS has determined that system logger services will not be available for the duration of this IPL.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization backs out all processing and brings down the RRS address space.

Operator Response: Inform your system programmer.

System Programmer Response: If RRS processing is required, system logger must be available. Investigate and resolve the logger problem, then re-IPL the systems and restart RRS.

ATR150E RRS PROCESSING IS DELAYED PENDING SYSTEM LOGGER SIGNAL. RC=*return-code***, RSN=***reason-code*

Explanation: Through its attempt to connect to a log stream, RRS has determined that the system logger is temporarily unable to process the request.

In the message text:

return-code
is the most recent return code from the IXGCONN macro.

reason-code
is the most recent reason code from the IXGCONN macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS issues message ATR151A to request input and waits for the reply.

Operator Response: Inform your system programmer.

System Programmer Response: Use the explanation of the return and reason codes, which you can find in the description of IXGCONN in *OS/390 MVS Programming: Assembler Services Reference*, to resolve the error.

ATR151A SYSTEM LOGGER DELAY WAS NOT RESOLVED. RESOLVE THE DELAY OR REPLY TERMINATE TO TERMINATE RRS.

Explanation: RRS tried to connect to a log stream but could not. After waiting for system logger to process its request, RRS issued the request again and again received a response indicating that system logger is temporarily unable to process this connect request. Message ATR150E accompanies this message.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS waits for system logger to resume handling requests, at which time RRS will retry the connect request, or a reply of TERMINATE, at which time RRS initialization will back out all processing and bring down the RRS address space.

Operator Response: Inform your system programmer.

System Programmer Response: To make RRS services available, you need to resolve the error condition. See message ATR150E, which accompanies this message, to obtain more information about the error. Once the error is resolved, RRS can begin to process requests.

If you decide you do not need RRS services at this time, or if you cannot resolve the error condition, reply TERMINATE to end RRS initialization and bring down the RRS address space.

If the reply is incorrect, the system issues message ATR152I to notify the operator, then reissues message ATR151A.

ATR152I THE RESPONSE TO MESSAGE *message* **IS INCORRECT:** *reply*

Explanation: The operator entered an incorrect response to the specified message.

In the message text:

message
The message identifier.

reply
The incorrect response.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: The system reissues the message that received an incorrect reply.

Operator Response: See the operator response for the indicated message and respond accordingly, if applicable.

System Programmer Response: None.

ATR153I OPERATOR REQUEST TO BACKOUT RRS INITIALIZATION WAS RECEIVED.

Explanation: The operator responded TERMINATE to message ATR152A.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization backs out all processing and brings down the RRS address space.

Operator Response: None.

System Programmer Response: None.

ATR154I RRS RECONNECTION TO MANDATORY LOGSTREAM: *logstreamname* **HAS FAILED. IXGCONN RC=***return-code***, RSN=***reason-code*

Explanation: Following the restored availability of the system logger address space, RRS cannot successfully reconnect to the specified log stream.

In the message text:

logstreamname
is the name of the log stream in error.

return-code
is the most recent return code from the IXGCONN macro.

reason-code
is the most recent reason code from the IXGCONN macro.

Source: Resource recovery services (RRS)

Detecting Module: ATRBMTME

System Action: If the return and reason code combination from logger indicates that the connect attempt failed so that RRS cannot wait for system logger to notify RRS when the log stream is available, RRS will take a dump and bring itself down. In this event, message ATR156I will accompany this one.

If, however, the failure to reconnect was due to a logger problem that might be temporary, RRS will again try to reconnect to the log stream.

Operator Response: If RRS comes down, inform your system programmer, otherwise,'no action is required.

System Programmer Response: If possible, use the logger return and reason code combination to diagnose and solve the problem that caused the failure. In the system log, see message IXG231I for the named log stream. Message IXG231I provides more detailed information about the reason for the failure. Once the problem has been resolved, use the START command to restart RRS. If you cannot resolve the problem, supply the accompanying dump and system log to your IBM Support Center.

ATR155I RRS RECONNECTION TO OPTIONAL LOGSTREAM: *logstreamname* **HAS FAILED. IXGCONN RC=***return-code***, RSN=***reason-code*

Explanation: In an attempt to reconnect to the RRS log streams, from which RRS has been disconnected by either system logger or hardware action, RRS has received a response from system logger indicating that the reconnection was not successful. Message IXG231I, issued to the system log, provides more detailed information about the reason for this failure.

In the message text:

logstreamname
is the name of the log stream in error.

return-code
is the most recent return code from the IXGCONN service.

reason-code
is the most recent reason code from the IXGCONN service.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRBMTME

System Action: RRS remains completely operational but does not use the named log stream.

Operator Response: Inform your system programmer.

System Programmer Response: If you want RRS to use this log stream, you need the logger return and reason codes to diagnose the problem that caused the failure. In the system log, locate message IXG231I for the named log stream; the message contains more detailed information about the reason for the failure. Resolving the problem might require clearing and/or redefining the log stream in question, which, in turn, means you will first need to bring down RRS. After you fix the log stream problem, you can use the START RRS command to make RRS active again.

ATR156I RRS CANCEL PROCESSING INITIATED DUE TO UNAVAILABILITY OF THE *logstreamname* **LOGSTREAM.**

Explanation: RRS could not reinstate its connection to the named log stream.

In the message text:

logstreamname
is the name of the log stream in error.

Source: Resource recovery services (RRS)

Detecting Module: ATRBMTME

System Action: RRS ends its processing and requests a dump. Message ATR154I accompanies this message.

Operator Response: Inform your system programmer.

System Programmer Response: See the response for message ATR154I. If you cannot solve the problem, provide this information and the associated dump to your IBM Support Center.

ATR157E RRS INITIALIZATION IS UNABLE TO PROCEED. SYSTEM LOGGER IS UNAVAILABLE.

Explanation: In its attempt to connect to its log streams, RRS has determined that the system logger address space is not active.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS is suspended until system logger becomes available. Message ATR162A accompanies this message.

Operator Response: Examine the hardcopy log to determine why system logger is not active. If the problem is simply that system logger has not been started, issue the START IXGLOGR command to activate system logger. If there is another reason why system logger is not available, inform your system programmer.

System Programmer Response: Determine why system logger has not started. If it is not possible to bring up system logger, respond TERMINATE to message ATR162A to halt RRS initialization, then provide this information to your IBM Support Center.

ATR158I RRS INITIALIZATION IS UNABLE TO PROCEED. THE *lstype* **LOGSTREAM** *lsname* **HAS A MAXIMUM BUFFER SIZE OF** *actualmaxbufsize* **WHICH IS NOT EQUAL TO THE MAXIMUM BUFFER SIZE OF** *requiredmaxbufsize* **FOR THE MAIN UR LOGSTREAM** *mainlsname***.**

Explanation: When connecting to log stream *lsname*, RRS detected that the actual maximum buffer size, *actualmaxbufsize*, for the log stream was not equal to the maximum buffer size, *requiredmaxbufsize*, for the MAIN UR log stream, *mainlsname.* To support the log block size that could be written into the log stream, the actual maximum buffer size must be at least as large as the required maximum buffer size for the MAIN UR log stream.

In the message text:

lstype
One of the following:

DELAYED UR
DELAYED UR log stream.

RESTART
RESTART log stream.

lsname
name of the log stream in error.

actualmaxbufsize
maximum buffer size of the log stream in error

requiredmaxbufsize
maximum buffer size of the RRS MAIN UR log stream.

mainlsname
name of the RRS MAIN UR log stream.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRAMINI

System Action: RRS backs out of initialization.

Operator Response: Inform your system programmer.

System Programmer Response:

1. Examine the rules for defining the logging structure for the RRS log stream *logstreamname*. See *OS/390 MVS Programming: Resource Recovery*.
2. Change the LOGR policy to ensure that the logging structure for log stream *logstreamname* meets the requirement. See *OS/390 MVS Setting Up a Sysplex*.
3. Restart RRS.

ATR159I RRS INITIALIZATION IS UNABLE TO PROCEED. LOGSTREAM *logstreamname* HAS A MAXIMUM BUFFER SIZE OF *actualmaxbufsize* WHICH IS LESS THAN THE MINIMUM SIZE OF *minimummaxbufsize*.

Explanation: When connecting to the named log stream, RRS detected that the actual maximum buffer size for the log stream was less than the minimum allowable maximum buffer size.

In the message text:

logstreamname
is the name of the log stream.

actualmaxbufsize
is the actual maximum buffer size.

minimummaxbufsize
is the minimum allowable maximum buffer size required to support the minimum log block size that could be written into the log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS backs out of initialization.

Operator Response: Inform your system programmer.

System Programmer Response:

1. Verify the requirement for defining the log structure for the RRS log stream *logstreamname*. See *OS/390 MVS Programming: Resource Recovery*.
2. Change the LOGR policy to ensure that the logging structure for log stream *logstreamname* meets the requirement. See *OS/390 MVS Setting Up a Sysplex*.
3. Restart RRS.

ATR160I LOGSTREAM *logstreamname* HAS A MAXIMUM BUFFER SIZE OF *actualmaxbufsize* WHICH IS LESS THAN THE MINIMUM SIZE OF *minimummaxbufsize*. LOG RECORDS MAY BE TRUNCATED.

Explanation: After connecting to the named log stream, RRS determined that the actual maximum buffer size for the log stream was less than the minimum required maximum buffer size. Log records that exceed the actual maximum buffer size will be truncated when written to the log.

In the message text:

logstreamname
is the name of the log stream.

actualmaxbufsize
is the actual maximum buffer size.

minimummaxbufsize
is the minimum allowable buffer size required to support the maximum log block size that could be written into the log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization continues.

Operator Response: Inform your system programmer.

System Programmer Response: Determine whether the potential truncation of log records is acceptable.

If it is not acceptable,

1. Verify the requirements for defining the log structure for log stream *logstreamname*. See *OS/390 MVS Programming: Resource Recovery*.
2. Across the sysplex, stop each RRS group member that is using the log stream.
3. Change the LOGR policy to ensure that the log structure for *logstreamname* meets the requirement. See *OS/390 MVS Setting Up a Sysplex*.
4. Across the sysplex, restart each RRS group member that was stopped to change the LOGR policy.

ATR161I RRS TERMINATING DUE TO FAILURE OF *task*

Explanation: A task critical to RRS operation has failed and cannot be reinstated.

In the message text:

task
One of the following:

RRS SERIALIZATION SERVER
RRS MASTER SERVER
NON-RRS MASTER SERVER
RRS TERMINATION SERVER
RRS SERVER ETXR

Source: Resource Recovery Services (RRS)

Detecting Module: ATRBMETX

System Action: RRS terminates. An ABEND and dump can accompany this message. The automatic restart manager (ARM) will, if possible, restart RRS.

Operator Response: Capture the dump, if one is issued. Notify your system programmer. If RRS does not restart automatically, use the START command to restart RRS.

System Programmer Response: Review the dump and logrec to identify the original error. Supply this information to the IBM Support Center.

ATR162A START THE SYSTEM LOGGER ADDRESS SPACE OR REPLY TERMINATE TO TERMINATE RRS.

Explanation: RRS initialization cannot proceed because the system logger address space is not available.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization is suspended, waiting for the system logger address space to start.

Once the system logger address space starts, this message is deleted.

Operator Response: Inform your system programmer.

System Programmer Response: To make RRS services available, you need to resolve the error condition. See message ATR157E, which accompanies this message, to obtain more information about the error. Once the error is resolved, RRS can begin to process requests.

If you decide you do not need RRS services at this time, or if you cannot resolve the error condition, reply TERMINATE to end RRS initialization and bring down the RRS address space.

If the reply is incorrect, the system issues message ATR152I to notify the operator, then reissues message ATR162A.

ATR163E RRS HAS DETECTED A POSSIBLE PROBLEM WITH STRUCTURE *structurename* **FOR LOGSTREAM** *logstreamname* **INTERVENTION MAY BE REQUIRED. RRS WILL CONTINUE TO ATTEMPT LOGSTREAM RECONNECTION.**

Explanation: In an attempt to reconnect to the RRS log streams, from which RRS has been disconnected by either system logger or hardware action, RRS has received a response from system logger indicating a structure problem on the couple data set. Message ATR154I will accompany this message.

In the message text:

structurename
is the name of the couple data set structure.

logstreamname
is the name of the log stream.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRBMTME

System Action: RRS continues to try to reconnect to the log streams, but any outstanding RRS requests are suspended until RRS can reconnect.

Operator Response: Notify your system programmer if this message remains outstanding for a significant amount of time (more than 10-15 minutes, for example).

System Programmer Response: If this message has remained outstanding for a significant amount of time, you might need to define the RRS log stream(s) to another structure. Once the structure problem has been resolved, RRS will reconnect to the desired log streams without any further intervention.

If you want to stop the suspension of RRS requests, issue the SETRRS CANCEL command, which will stop RRS and not allow automatic restart. When you have resolved the structure problem, issue the START RRS command to restart RRS.

ATR164I RRS DOES NOT SUPPORT DASD-ONLY LOGSTREAMS

Explanation: RRS connected to its log streams and found at least one was a DASD-only log stream. RRS does not support DASD-only log streams.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRAMINI

System Action: The RRS address space terminates.

Operator Response: Start RRS with coupling facility log streams or notify your system programmer.

System Programmer Response: Define coupling facility log streams for RRS.

ATR165I RRS EXITS FOR *jobname* **IN ASID** *asid* **ARE BEING PURGED.**

Explanation: The RRS address space has terminated. RRS RESMGR processing is attempting to purge the outstanding SRB exits that RRS scheduled to the named jobname/ASID.

In the message text:

jobname
is the jobname.

asid
is the ASID.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRAMRM

System Action: The RRS RESMAG waits for the purge to complete.

Operator Response: None.

System Programmer Response: None.

ATR166I RRS EXITS FOR *jobname* **IN ASID** *asid* **ARE BEING PURGED. DIAG=***diag*

Explanation: RRS RESMGR processing has completed purging the outstanding SRB exits that RRS scheduled to the named jobname/ASID. A zero DIAG value indicates a successful purge. A non-zero DIAG value indicates that the target space is terminating or has terminated and only SRBs that have been scheduled, but not dispatched, have been purged.

In the message text:

jobname
is the jobname.

asid
is the ASID.

diag
is an internal diagnostic code.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRAMRM

System Action: RRS RESMAG processing continues.

Operator Response: None.

System Programmer Response: None.

ATR167I RRS RESMGR PROCESSING COMPLETED.

Explanation: RRS RESMGR processing is complete.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRAMRM

System Action: RRS address space termination is complete and RRS is no longer active.

Operator Response: None.

System Programmer Response: None.

ATR201I RRS COLD START IS IN PROGRESS.

Explanation: RRS is cold starting.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMRRS

System Action: RRS clears out its logs to eliminate any work that might have been active.

Operator Response: None.

System Programmer Response: None.

ATR202D GAP FOUND IN *logstreamname*. REPLY RETRY TO RETRY OR ACCEPT TO ACCEPT THE DATA LOSS

Explanation: RRS has encountered a gap in the named log stream. Possible reasons for the gap are:

- At least one of the DASD volumes that back up the named log stream is offline.
- Incorrect SHAREOPTIONS were specified when the log stream data sets or staging data sets were defined. If you have multiple systems in the sysplex and you use SMS to manage DASD data sets, you must specify VSAM SHAREOPTIONS(3,3) for log stream data sets and staging area data sets.

In the message text:

logstreamname
is the name of the affected log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMRRS

System Action: RRS waits for your reply. If you reply RETRY, RRS assumes the log stream gap has been repaired; it will retry the function. If you reply ACCEPT, RRS will treat the gap as a loss of data, which might cause mixed outcome transactions, or if the gap is in the RM.DATA log stream, RRS will terminate.

Operator Response: Reply RETRY if the log stream gap has been fixed, reply ACCEPT if the gap cannot be fixed, or contact the system programmer.

If the gap is in the RM.DATA log stream, replying ACCEPT will cause RRS to terminate, as RRS cannot tolerate a data loss in the RM.DATA log stream.

System Programmer Response: Try to fix the gap in the named log stream. For example, verify that all the required backup DASD volumes are online, then reply RETRY. If you cannot fix the gap, reply ACCEPT.

If the gap is in the RM.DATA log stream and you cannot fix the gap, remember that replying ACCEPT will cause RRS to terminate. You will then have to repair the RM.DATA log stream and cold start RRS.

ATR203I RRS COULD NOT READ FROM THE RM DATA LOG.

Explanation: RRS was unable to read data from the RM.DATA log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMRRS

System Action: RRS initialization ends, and RRS is stopped. The system writes a LOGREC entry to describe the failure and issues message ATR215I to the system log to provide details on the error.

Operator Response: Notify the systems programmer.

System Programmer Response: To determine why RRS failed while reading from the RM.DATA log stream, obtain the LOGREC entry for this failure. If possible, fix the problem and restart RRS. Otherwise, notify the IBM Support Center.

ATR204I RRS COULD NOT WRITE TO THE RM DATA LOG.

Explanation: RRS was unable to write data to the RM.DATA log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMRRS

System Action: RRS initialization ends, and RRS is stopped. The system writes a LOGREC entry to describe the failure and issues message ATR215I to the system log to provide details on the error.

Operator Response: Notify the systems programmer.

System Programmer Response: To determine why RRS failed while writing to the RM.DATA log stream, obtain the LOGREC entry for this failure. If possible, fix the problem and restart RRS. Otherwise, notify the IBM Support Center.

ATR205I RRS COULD NOT CLEAR THE *logstreamname* LOGSTREAM

Explanation: RRS was unable to clear the data from the named log stream.

In the message text:

logstreamname
is the name of the affected log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMRRS

System Action: RRS initialization ends, and RRS is stopped. The system writes a LOGREC entry to describe the failure and issues message ATR302I to the system log to provide details on the error.

Operator Response: Notify the systems programmer.

System Programmer Response: To determine why RRS failed while clearing the named log stream, obtain the LOGREC entry for this failure. If possible, fix the problem and restart RRS. Otherwise, delete and redefine the log stream and restart RRS.

ATR206I RRS COULD NOT SUCCESSFULLY PERFORM LOG TAKEOVER FOR THIS SYSTEM

Explanation: RRS was unable to process the outstanding units of recovery for this system.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMRRS

System Action: RRS initialization ends, and RRS is stopped. A LOGREC entry is written to describe the failure.

Operator Response: Notify the systems programmer.

System Programmer Response: To determine why RRS failed, obtain the LOGREC entry for this failure. If possible, fix the problem and restart RRS. Otherwise, contact your IBM Support Center.

ATR207I RRS COULD NOT CREATE NAME TOKEN PAIR. RC = *return-code*

Explanation: RRS initialization has been unable to create a name/token pair to hold the RRS STOKEN.

In the message text:

return-code
is the return code from the IEANTCR service

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization ends The RRS address space is not available.

Operator Response: Inform your system programmer.

System Programmer Response: Report the problem and the diagnostic information in the message to your IBM Support Center.

ATR208I RRS HAS DETECTED A LOG DATA LOSS ON *lstype* LOGSTREAM *lsname* AFTER CONNECTING TO A NEW VERSION OF THE LOGSTREAM. OLD VERSION: *oldlsversion* NEW VERSION: *newlsversion*

Explanation: RRS has detected a log data loss as a result of connecting to a new version of the log stream identified in the message. RRS changed to a new version of the log stream because the log stream definition in the LOGR policy for *lsname* was deleted and then redefined.

In the message text:

lstype
is one of the following:

MAIN UR
The RRS MAIN.UR log stream.

DELAYED UR
The RRS DELAYED.UR log stream.

RESTART
The RRS RESTART log stream.

lsname
is the name of the log stream.

oldlsversion
identifies the version of the log stream RRS expected to connect to. The identifier is the GMT timestamp created when the log stream was defined.

newlsversion
identifies the version of the log stream RRS connected to. The identifier is the GMT timestamp created when the log stream was defined.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: The system action depends on which log stream encountered the version mismatch.

MAIN UR
Each resource manager that might have had data in the MAIN.UR log stream is marked as having potentially lost log data. During resource manager restart, RRS issues a unique return code to inform the resource manager of the possible data loss.

RRS initialization continues.

DELAYED UR
Each resource manager that might have had data in the DELAYED.UR log stream is marked as having potentially lost log data. During resource manager restart, RRS issues a unique return code to inform the resource manager of the possible data loss.

Additionally, RRS marks all UR state log entries in the MAIN.UR log as heuristic mixed, and it issues message ATR219I whenever it marks URs as heuristic mixed during log takeover processing.

RRS initialization continues.

RESTART
Each resource manager that might have had data in the RESTART log stream is marked as having potentially lost log data. During resource manager restart, RRS issues a unique return code to inform the resource manager of the possible data loss.

RRS initialization continues.

RRS issues message ATR209I whenever it marks a resource manager as having lost log data.

Operator Response: Inform your system programmer.

System Programmer Response: Check the hardcopy log to see if messages ATR209I and ATR219I were issued as a result of this error. Follow the system programmer response for whichever additional message that was issued.

ATR209I RESOURCE MANAGER *rmname* MAY HAVE LOST LOG DATA.

Explanation: RRS has detected inaccessible data in its logs, and the lost data potentially affects the named resource manager.

Message ATR208I or ATR212I provides more information about why the RRS log data was inaccessible.

In the message text:

rmname
is the resource manager name.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMTLE

System Action: Whenever the named resource manager restarts with RRS, it will be notified that RRS has lost log data in which the resource manager had interest.

Operator Response: Inform your system programmer.

System Programmer Response: Use any accompanying message to determine what caused RRS to lose log data for this resource manager.

ATR210E INACCESSIBLE LOG DATA DETECTED ON THE RRS RM DATA LOGSTREAM *lsname*

Explanation: RRS has encountered inaccessible log data in the named RM.DATA log stream. RRS cannot access the log data either because data has been lost or there is an uncorrectable gap in the log data.

In the message text:

lsname
is the name of the log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: The system issues message ATR218I, which will explain the effects on the system.

Operator Response: Inform your system programmer.

System Programmer Response: To clear the problem with the RM.DATA log, you must cold start each member of the RRS group. The RRS group name is the second qualifier of the log stream name.

ATR211I RRS DETECTED AN ATTEMPT TO COLD START WHILE RRS WAS ACTIVE. REASON: *reason*

Explanation: RRS detected an attempt to cold start RRS while RRS was active. The condition that caused RRS to detect the cold start request is indicated by *reason*.

In the message text:

reason
is one of the following:

LOGSTREAM VERSION MISMATCH.
RRS detected a different version of the RM.DATA log stream from the one to which RRS was previously connected.

LOGSTREAM EMPTY.
RRS detected an empty RM.DATA log stream after a cold start.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: The RRS address space ends.

Operator Response: Inform your system programmer.

System Programmer Response:

Depending on the *reason*, determine why the problem occurred:

LOGSTREAM VERSION MISMATCH
Determine whether deleting and redefining the RM.DATA log stream definition in the LOGR policy was intentional. If so, to avoid this message in the future, cancel all active RRS members in the RRS group before redefining the RM data log stream.

If it was not intentional, rework your procedures for redefining the RRS RM.DATA log stream to avoid the problem in the future.

LOGSTREAM EMPTY
Determine if an application other than RRS could have deleted log data from the RM.DATA log stream. If so, either change the application or remove its authorization to update the log stream. Only RRS should have update authority to the RM.DATA log stream.

If there were no applications in the installation that could have deleted log data from the RM.DATA log stream, contact your IBM Support Center.

ATR212I RRS DETECTED LOG DATA LOSS ON LOGSTREAM *lsname* **DUE TO INACCESSIBLE LOG DATA. LOG DATA FROM** *lowgmt* **TO** *highgmt* **ARE AFFECTED.**

Explanation: RRS detected inaccessible log data on the named log stream. RRS cannot access the log data either because data has been lost or there is an uncorrectable gap in the log data.

In the message text:

lsname
is the name of the log stream.

lowgmt
is either the GMT timestamp of the last valid log data before the inaccessible range of log data or ********** if there was no valid log data before the inaccessible range.

highgmt
is the GMT timestamp of the first accessible log data after the inaccessible range of log data or the GMT time when the message was issued if there is no valid log data after the inaccessible range.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: The message reports the fact that RRS detected inaccessible log data. Subsequent messages provide more specific information about how the error affects processing.

The subsequent messages that RRS might issue are ATR209I, ATR210E, ATR218I or ATR219I.

Operator Response: Inform your system programmer.

System Programmer Response: Determine if message ATR209I, ATR210E, ATR218I, or ATR219I was issued in addition to this message. Follow the system programmer response provided for the additional message.

ATR213I ARCHIVE FAILED FOR LOGSTREAM *lsname* **DUE TO THE LACK OF A CONNECTED ARCHIVE LOG.**

Explanation: RRS did not move the log entries from log stream *lsname* to the ARCHIVE log during an RRS cold start because RRS was not connected to the ARCHIVE log stream.

In the message text:

lsname
is the name of the log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMFLG

System Action: RRS continues cold start processing, but all entries in the named log stream are deleted.

Operator Response: Inform your system programmer.

System Programmer Response: This message records the fact that RRS was unable to move existing UR state log entries from log stream *lsname* to the ARCHIVE log stream when RRS cold started.

ATR214I RRS FAILED TO FLUSH ALL LOG DATA FOR LOGSTREAM *lsname* DUE TO INACCESSIBLE LOG DATA. LOG DATA FROM *lowgmt* TO *highgmt* ARE AFFECTED.

Explanation: While moving entries to the archive log during an RRS cold start, RRS encountered inaccessible log data in the named log stream. RRS cannot access the log data either because data has been lost or there is an uncorrectable gap in the log data.

In the message text:

lsname
is the name of the log stream.

lowgmt
is either the GMT timestamp of the last valid log data before the inaccessible range of log data or ********** if there was no valid log data before the inaccessible range.

highgmt
is the GMT timestamp of the first accessible log data after the inaccessible range of log data or the current GMT time when the message was issued if there is no valid log data after the inaccessible range.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMFLG

System Action: RRS moves the accessible entries in log stream *lsname* to the archive log and writes an entry to the archive log that describes the time range of the log data that might be missing. This information is displayed to a user of the RRS ISPF panels when browsing the archive log stream.

The RRS address space continues cold start processing.

Operator Response: Inform your system programmer.

System Programmer Response: This message records the fact that, during a cold start, RRS was unable to move existing UR state log entries from log stream *lsname* to the archive log.

ATR215I RRS ENCOUNTERED AN ERROR READING LOGSTREAM *lsname* RETURN CODE: *return-code* REASON CODE: *reason-code* DIAGNOSTIC INFORMATION: *diag1 diag2 diag3 diag4*

Explanation: While reading log stream *lsname*, RRS encountered the error this message reports. Additional messages will describe how the error affects processing.

This message includes the return code and reason code from the system logger browse service, IXGBRWSE, as well as additional diagnostic information that system logger returns.

In the message text:

lsname
is the name of the log stream.

return-code
is the return code from IXGBRWSE.

reason-code
is the reason code from IXGBRWSE.

diag1
is the diagnostic field, ANSAA_DIAG1, from the IXGBRWSE answer area. For the meaning of this field, see the description of the return code and reason code from IXGBRWSE in *OS/390 MVS Programming: Assembler Services Reference*.

diag2
is the diagnostic field, ANSAA_DIAG2, from the IXGBRWSE answer area. For the meaning of this field, see the description of the return code and reason code from IXGBRWSE in *OS/390 MVS Programming: Assembler Services Reference*.

diag3
is additional diagnostic information for the use of the IBM Support Center.

diag4
is additional diagnostic information for the use of the IBM Support Center.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS returns the error to the function that requested the log read.

Operator Response: Inform your system programmer.

System Programmer Response: Use the description of IXGBRWSE in *OS/390 MVS Programming: Assembler Services Reference* to determine the reason for the error and the action required for the specific error.

ATR216I RRS ENCOUNTERED AN ERROR WRITING TO LOGSTREAM *lsname* RETURN CODE: *return-code* REASON CODE: *reason-code* DIAGNOSTIC INFORMATION: *diag1 diag2 diag3 diag4*

Explanation: While trying to write to log stream *lsname*, RRS encountered the error this message reports. Additional messages will describe how the error affects processing.

This message includes the return code and reason code from the system logger write service, IXGWRITE, as well as additional diagnostic information that system logger returns.

In the message text:

lsname
is the name of the log stream.

return-code
is the return code from IXGWRITE.

reason-code
is the reason code from IXGWRITE.

diag1
is the diagnostic field, ANSAA_DIAG1, from the IXGWRITE answer area. For the meaning of this field, see the description of the return code and reason code from IXGWRITE in *OS/390 MVS Programming: Assembler Services Reference*.

diag2
is the diagnostic field, ANSAA_DIAG2, from the IXGWRITE answer area. For the meaning of this field, see the description of the return code and reason code from IXGWRITE in *OS/390 MVS Programming: Assembler Services Reference*.

diag3
is additional diagnostic information for the use of the IBM Support Center.

diag4
is additional diagnostic information for the use of the IBM Support Center.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS returns the error to the function that requested the log write.

Operator Response: Inform your system programmer.

System Programmer Response: Use the description of IXGWRITE in *OS/390 MVS Programming: Assembler Services Reference* to determine the reason for the error and the action required for the specific error. If you cannot resolve the problem, contact the IBM Support Center.

ATR217I RRS DETECTED A NEW VERSION OF THE *lstype* **LOGSTREAM** *lsname* **AFTER RECONNECTING TO THE LOGSTREAM. OLD VERSION:** *oldlsversion* **NEW VERSION:** *newlsversion*

Explanation: RRS reconnected to a new version of the log stream identified in the message. RRS changed to a new version of the log stream because the log stream definition in the LOGR policy for *lsname* was deleted and then redefined.

In the message text:

lstype
One of the following:

RM DATA
The RRS RM.DATA log stream.

MAIN UR
The RRS MAIN.UR log stream.

DELAYED UR
The RRS DELAYED.UR log stream.

RESTART
The RRS RESTART log stream.

lsname
is the name of the log stream.

oldlsversion
identifies the version of the log stream RRS expected to connect to. The identifier is the GMT timestamp created when the log stream was defined.

newlsversion
identifies the version of the log stream RRS connected to. The identifier is the GMT timestamp created when the log stream was defined.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: The RRS address space ends so that a restart of RRS can resolve the log stream version change and the resulting log data loss.

Operator Response: Restart RRS.

System Programmer Response: None.

ATR218I *processname* **PROCESS HAS FAILED DUE TO INACCESSIBLE LOG DATA IN LOGSTREAM** *lsname***.**

Explanation: The named RRS process has failed because inaccessible log data was found in the named RM.DATA log stream.

Message ATR210E accompanies this message.

In the message text:

processname
One of the following:

INITIALIZATION
RRS address space initialization.

TAKEOVER
RRS log takeover for a failed peer instance of RRS.

RM RESTART
Resource manager begin restart.

RETRIEVE LOGNAME
Resource manager retrieve logname.

SET LOGNAME
Resource manager set logname.

RM DATA LOG COMPRESSION
RM.DATA log compression.

MAIN UR LOG COMPRESSION
MAIN.UR log compression.

DELAYED UR LOG COMPRESSION
DELAYED.UR log compression process.

RECONNECT
Log stream reconnection.

lsname
is the name of the log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: The system action depends on the process that failed, as follows:

INITIALIZATION
RRS initialization has failed. All subsequent attempts to restart RRS will fail.

TAKEOVER
Log takeover processing has failed. Takeover processing has been disabled on this system.

RM RESTART
Resource manager restart processing has failed. Resource manager restart processing has been disabled on this system.

RETRIEVE LOGNAME
An attempt by a resource manager to retrieve a logname has failed. All subsequent logname retrieval attempts will fail.

SET LOGNAME
An attempt by a resource manager to set its logname has failed. All subsequent attempts to set a resource manager logname will fail.

RM DATA LOG COMPRESSION
Log stream compression for the RM.DATA log stream *lsname* has failed. Compression processing for the RM.DATA log stream has been disabled.

MAIN UR LOG COMPRESSION
Log stream compression for the MAIN.UR log stream has failed. Compression processing for the MAIN.UR log stream has been disabled.

DELAYED UR LOG COMPRESSION
Log stream compression for the DELAYED.UR log stream has failed. Compression processing for the DELAYED.UR log stream has been disabled.

RECONNECT
The RRS address space failed because there is inaccessible log data in the RM.DATA log named *lsname*.

Operator Response: Inform your system programmer and provide the *processname*.

System Programmer Response: To clear the error in the RM data log stream, you must cold start all the RRS members in the RRS group. The RRS group name is the second qualifier in the log stream name.

ATR219I RRS HAS MARKED SOME UR STATE LOG ENTRIES AS HEURISTIC MIX WHILE PERFORMING LOG TAKEOVER FOR *sysname*

Explanation: RRS has marked one or more URs as heuristic mixed because it detected inaccessible log data while performing log takeover for system *sysname*.

The state of the resources associated with the UR might be questionable.

In the message text:

sysname
is the system name of the system for which RRS is performing takeover.

Source: Resource recovery services (RRS)

Detecting Module: ATRTMTLE

System Action: RRS has marked as heuristic mixed any URs that were **in-prepare** or **in-doubt** that might be missing more recent log entries.

Log takeover processing continues.

Operator Response: Inform your system programmer.

System Programmer Response: Ensure that the resources are returned to a consistent state.

ATR220A GAP FOUND IN *logstreamname***. REPAIR THE GAP AND REPLY TO ATR202D**

Explanation: RRS has encountered a gap in the named log stream.

In the message text:

logstreamname
is the name of the affected log stream.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRTMRRS

System Action: RRS waits for the reply to message ATR202D. If the reply is RETRY, RRS assumes the gap has been repaired and will retry the function. If the reply is ACCEPT, RRS will proceed with processing the loss of data.

Operator Response: In response to message ATR202D, reply RETRY if the gap condition has been fixed or reply ACCEPT if the gap condition can not be fixed, or notify the system programmer.

System Programmer Response: Try to fix the gap in the named log stream, then reply RETRY. Otherwise, reply ACCEPT.

ATR221I RRS IS JOINING RRS GROUP *groupname* **ON SYSTEM** *sysname*

Explanation: RRS is starting on the named system and joining the RRS log group identified by *groupname*.

In the message text:

groupname
is the RRS log group name.

sysname
is the name of system on which this instance of RRS is running.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS initialization continues.

Operator Response: If the log group name is correct, none. Otherwise, notify the system programmer.

System Programmer Response: If the log group name is not correct, you might need to stop RRS and restart it with the correct log group name.

ATR222I LOG TAKEOVER FOR SYSTEM *sysname* **HAS COMPLETED SUCCESSFULLY.**

Explanation: The system issuing this message has detected that RRS on the named system is not active and moved the RRS UR State log entries for the named system into the RRS Restart logstream. This allows the resource managers that were active on the named system to restart with RRS on some other system.

In the message text:

sysname
is the system name of the system whose log entries are being taken over.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRTMLTK

System Action: Processing continues.

Operator Response: None.

System Programmer Response: None.

ATR223I LOG TAKEOVER FOR SYSTEM *sysname* **HAS FAILED.**

Explanation: RRS failed to complete log takeover for system *sysname*.

In the message text:

sysname
is the system name of the system whose log entries are being taken over.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRTMLTK

System Action: Processing continues. RRS will continue to attempt log takeover for *sysname* until it is successful, at which point message ATR222I is issued.

Operator Response: None.

System Programmer Response: Check the hardcopy log to determine if a subsequent attempt to take over the log entries for system *sysname* was successful. RRS issues message ATR222I whenever log takeover completes successfully.

If log takeover continues to fail, contact IBM service and provide the diagnostic data from the message.

ATR224I UNRECOVERABLE ERRORS HAVE OCCURRED WHILE PROCESSING THE UR, UR IS MARKED DAMAGED. URID = *uridentifier*.

Explanation: RRS has encountered one or more unrecoverable errors while processing the unit of recovery (UR) identified in the message; RRS cannot process subsequent sync-point requests for the UR.

In the message text:

uridentifier
is the identifier of the UR marked as damaged.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRSMSPT

System Action: RRS continues processing, but it has marked the UR as damaged.

Operator Response: None

User Response: None

System Programmer Response: There is no specific response to this message, which generally appears as part of an RRS problem described in other messages. Respond to the problem the other messages describe, which might require manual intervention to ensure resource consistency.

ATR225D CANCEL DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: An operator issued the CANCEL command for an application, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery). Before CANCEL command processing can continue, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR.

Source: Resource recovery services (RRS)

Detecting Module: ATRSMSPT

System Action: The system delays CANCEL command processing until the UR is resolved. When the UR is resolved, the system processes the CANCEL command.

Operator Response: Notify the system programmer.

User Response: None.

System Programmer Response: Reply WAIT to cause RRS to wait for the distributed sync-point manager (DSRM) to resolve the **in-doubt** UR. If replying WAIT does not work, you can use the RRS panels to resolve the **in-doubt** UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want RRS to wait for the DSRM, reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR226D MEMTERM DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: The system tried to end an address space, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery). Before the address space can end, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR.

Source: Resource recovery services (RRS)

Detecting Module: ATRSMSPT

System Action: The system does not end the address space; it delays ending the address space until the UR is resolved. When the UR is resolved, the system ends the address space.

Operator Response: Notify the system programmer.

User Response: None.

System Programmer Response: Reply WAIT to cause RRS to wait for the distributed sync-point manager (DSRM) to resolve the **in-doubt** UR. If replying WAIT does not work, you can use the RRS panels to resolve the **in-doubt** UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want RRS to wait for the DSRM, reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR227D CANCEL DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: An operator issued the CANCEL command for an application, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery), and the program needed to resolve the **in-doubt** UR is no longer available. Before CANCEL command processing can continue, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR

Source: Resource recovery services (RRS)

Detecting Module: ATRAMAPT

System Action: The system delays CANCEL command processing until the UR is resolved. When the UR is resolved, the system processes the CANCEL command.

Operator Response: Notify the system programmer.

User Response: None.

System Programmer Response: Reply WAIT to cause RRS to wait for the distributed sync-point manager (DSRM) to resolve the **in-doubt** UR. If replying WAIT does not work, you can use the RRS panels to resolve the **in-doubt** UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want RRS to wait for the DSRM, reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR228D MEMTERM DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: The system tried to end an address space, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery), and the program needed to resolve the **in-doubt** UR is no longer available. Before the address space can end, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR (unit of recovery).

Source: Resource recovery services (RRS)

Detecting Module: ATRSMSPT

System Action: The system does not end the address space; it delays ending the address space until the UR is resolved. When the UR is resolved, the system ends the address space.

System Programmer Response: Restart the required resource manager and reply WAIT to cause RRS to wait for the distributed sync-point manager (DSRM) to resolve the **in-doubt** UR. If replying WAIT does not work, you can use the RRS panels to resolve the **in-doubt** UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want to wait for the DSRM, reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR229D CANCEL DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: An operator issued the CANCEL command for an application, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery). Before CANCEL command processing can continue, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR.

Source: Resource recovery services (RRS)

Detecting Module: ATRBMECY

System Action: The system delays CANCEL command processing until the UR is resolved. When the UR is resolved, the system processes the CANCEL command.

Operator Response: Notify the system programmer.

User Response: None.

System Programmer Response: Reply WAIT to cause RRS to wait for the server distributed sync-point manager (SDSRM) to resolve the **in-doubt** UR. If replying WAIT does not work, you can use the RRS panels to resolve the **in-doubt** UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want RRS to wait for the SDSRM to resolve the UR, reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR230D MEMTERM DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: The system tried to end an address space, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery). Before the address space can end, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR.

Source: Resource recovery services (RRS)

Detecting Module: ATRBMECY

System Action: The system does not end the address space; it delays ending the address space until the UR is resolved. When the UR is resolved, the system ends the address space.

Operator Response: Notify the system programmer.

User Response: None.

System Programmer Response: Reply WAIT to cause RRS to wait for the server distributed sync-point manager (SDSRM) to resolve the **in-doubt** UR. If replying WAIT does not work, you can use the RRS panels to resolve the **in-doubt** UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want RRS to wait for the SDSRM to resolve the UR, reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR231D CANCEL DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: An operator issued the CANCEL command for an application, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery), and the program needed to resolve the **in-doubt** UR is no longer available. Before CANCEL command processing can continue, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR

Source: Resource recovery services (RRS)

Detecting Module: ATRBMECY

System Action: The system delays CANCEL command processing until the UR is resolved. When the UR is resolved, the system processes the CANCEL command.

Operator Response: Notify the system programmer.

User Response: None.

System Programmer Response: Restart the required server distributed sync-point resource manager (SDSRM) and reply WAIT to cause RRS to wait for the SDSRM to resolve the **in-doubt** UR. If replying WAIT does not work, you can use the RRS panels to resolve the **in-doubt** UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want RRS to wait for the SDSRM to resolve the UR, reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR232D MEMTERM DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: The system tried to end an address space, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery), and the program needed to resolve the **in-doubt** UR is no longer available. Before the address space can end, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR (unit of recovery).

Source: Resource recovery services (RRS)

Detecting Module: ATRBMECY

System Action: The system does not end the address space; it delays ending the address space until the UR is resolved. When the UR is resolved, the system ends the address space.

System Programmer Response: Restart the required server distributed sync-point manager (SDSRM) and reply WAIT to cause RRS to wait for the SDSRM to resolve the **in-doubt** UR. If replying WAIT does not work, you can use the RRS panels to resolve the **in-doubt** UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want RRS to wait for the SDSRM to resolve the UR, reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR233D CANCEL DELAYED. REPLY BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: An operator issued the CANCEL command to cancel the server distributed sync-point resource manager (SDSRM), but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery), and the SDSRM being cancelled is the program needed to resolve the **in-doubt** UR. Before CANCEL command processing can continue, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR

Source: Resource recovery services (RRS)

Detecting Module: ATRBMECY

System Action: The system delays CANCEL command processing until the UR is resolved. When the UR is resolved, the system processes the CANCEL command.

Operator Response: Notify the system programmer.

User Response: None.

System Programmer Response: Reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

IBM recommends that you do not use the FORCE command when this message is outstanding.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR234D MEMTERM DELAYED. REPLY BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR. URID=uridentifier

Explanation: The system tried to end an address space where the server distributed sync-point resource manager (SDSRM) program was running, but there is a sync-point operation in progress for an **in-doubt** UR (unit of recovery), and the SDSRM being ended is the program needed to resolve the **in-doubt** UR. Before the address space can end, the **in-doubt** UR must be resolved.

In the message text:

uridentifier
UR identifier for the **in-doubt** UR

Source: Resource recovery services (RRS)

Detecting Module: ATRBMECY

System Action: The system does not end the address space; it delays ending the address space until the UR is resolved. When the UR is resolved, the system ends the address space.

Operator Response: Notify the system programmer.

User Response: None.

System Programmer Response: Reply either:

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

IBM recommends that you do not use the FORCE command when this message is outstanding.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

ATR301E RRS IS UNABLE TO COMPRESS *lstype* **LOGSTREAM** *lsname*

Explanation: RRS cannot compress the log stream identified in the message because of unexpected errors from the system logger.

Message ATR216I, ATR302I, or ATR303I, issued to the hardcopy log, provides additional information about the error.

In the message text:

lstype
One of the following:

MAIN UR
the RRS MAIN.UR log stream.

DELAYED UR
the RRS DELAYED.UR log stream.

RM DATA
the RRS RM DATA log stream.

RESTART
the RRS RESTART log stream.

lsname
the name of the log stream.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS is unable to delete log data from the *lstype* log stream. The log stream will continue to increase in size until the error condition is corrected.

Once RRS is again able to compress the log stream, or if the RRS address space terminates, this message is deleted.

Operator Response: Locate message ATR216I, ATR302I, or ATR303I, in the hardcopy log and inform the system programmer.

System Programmer Response: To determine the error and take appropriate action, locate message ATR216I, ATR302I, or ATR303I in the hardcopy log. Use the system programmer response to correct the error condition, if possible.

Otherwise, monitor the size of the log stream by using the system logger policy utility to list the number of data sets in the log stream. To prevent the *lsname* log stream from encountering a log stream full condition, you might need to provide data set directory extent records in the system logger couple data set.

ATR302I RRS ENCOUNTERED AN ERROR COMPRESSING LOGSTREAM *lsname* **RETURN CODE:** *return-code* **REASON CODE:** *reason-code* **DIAGNOSTIC INFORMATION:** *diag1 diag2 diag3 diag4*

Explanation: While compressing the log stream named in the message, RRS encountered an error. No log data is deleted from this log stream until the error is corrected. Message ATR301E accompanies this message.

In the message text:

lsname
is the name of the log stream.

return-code
is the return code from the system logger delete service, IXGDELET.

reason-code
is the reason code from the system logger delete service, IXGDELET.

diag1
is the diagnostic field, ANSAA_DIAG1, from the IXGDELET answer area. For the meaning of this field, see the description of the return code and reason code from IXGDELET in *OS/390 MVS Programming: Assembler Services Reference*.

diag2
is the diagnostic field, ANSAA_DIAG2, from the IXGDELET answer area. For the meaning of this field, see the description of the return code and reason code from IXGDELET in *OS/390 MVS Programming: Assembler Services Reference*.

diag3
is additional diagnostic information for the use of the IBM Support Center.

diag4
is additional diagnostic information for the use of the IBM Support Center.

Source: Resource recovery services (RRS)

Detecting Module: ATRAMINI

System Action: RRS cannot delete log data from the log stream until the error is corrected.

The log stream will continue to increase in size until the error condition is corrected.

Operator Response: Inform your system programmer.

System Programmer Response: Use the description of IXGDELET in *OS/390 MVS Programming: Assembler Services Reference* to determine the reason for the error and the action required for the specific error.

ATR303I RRS ENCOUNTERED AN ERROR COMPRESSING LOGSTREAM *logstreamname* **RETURN CODE:** *return-code* **REASON CODE:** *reason-code* **DIAGNOSTIC INFORMATION:** *diag1 diag2 diag3 diag4 diag5*

Explanation: RRS encountered an error while either reading or updating the delete point for a system in log stream *logstreamname*.

No log data is deleted from this log stream until the error is corrected. Message ATR301E is also issued for this condition.

In the message text:

logstreamname
is the name of the log stream.

return-code
is the return code from the system logger service.

reason-code
is the reason code from the system logger service.

diag1
is the diagnostic field, ANSAA_DIAG1, from the IXGWRITE answer area. For the meaning of this field, see the description of the return code and reason code from IXGWRITE in *OS/390 MVS Programming: Assembler Services Reference*.

diag2
is the diagnostic field, ANSAA_DIAG2, from the IXGWRITE answer area. For the meaning of this field, see the description of the return code and reason code from IXGWRITE in *OS/390 MVS Programming: Assembler Services Reference*.

diag3
is diagnostic information for IBM use only.

diag4
is diagnostic information for IBM use only.

diag5
is diagnostic information for IBM use only.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRAMINI

System Action: RRS is unable to delete log data from the log stream until the condition is resolved.

The log stream will continue to grow in size until the error condition that is preventing RRS from deleting log data is corrected.

Operator Response: None.

System Programmer Response: Use the description of IXGWRITE in *OS/390 MVS Programming: Assembler Services Reference* to determine the reason for the error and the action required for the specific error.

If you are unable to determine the cause of the error, contact IBM support and provide this message.

ATR304E RRS ON *systemname* **IS UNABLE TO JOIN RRS GROUP** *groupname*

Explanation: RRS on *systemname* is unable to join, or determine if it needs to join the RRS group *groupname* because of an error from the system logger.

In the message text:

systemname
is the name of the system from which RRS attempted to join the RRS group.

groupname
is the name of the RRS group that the 'system attempted to join.

Source: Resource Recovery Services (RRS)

Detecting Module: ATRAMINI

System Action: RRS does not allow any resource manager to restart until the error is fixed, at which point RRS deletes the message.

RRS issues message ATR303I to the hardcopy log. The message provides specific diagnostic information.

Operator Response: Find message ATR303I in the hardcopy log and inform the system programmer.

System Programmer Response: Use the contents of message ATR303I to identify the error condition the system logger returned. Follow the system programmer response for that message to correct the error condition, if possible, then restart the resource managers.

Otherwise, consider having this RRS join a different RRS group by changing the procedure used to start RRS. Make this decision carefully because there might be resource managers running on *systemname*. You can use the RRS ISPF Log Browse panel to determine whether resource managers that will restart on *systemname* have interests in the RESTART log of the RRS group identified in *groupname*.

ATR305E RRS IS UNABLE TO WRITE TO *lstype* **LOGSTREAM** *logstreamname* **ON SYSTEM** *sysname*

Explanation: RRS cannot write to the *lstype* log stream named *logstreamname* because RRS encountered errors when using the system logger IXGWRITE service.

Additionally, RRS issues message ATR216I, which provides specific diagnostic information.

In the message text:

lstype
Identifies the log stream type as one of the following:

MAIN UR
DELAYED UR
ARCHIVE
RM DATA
RESTART

logstreamname
is the name of the log stream.

sysname
is the system name on which the error was encountered

Source: Resource Recovery Services (RRS)

Detecting Module: ATRLMLOG

System Action: The action varies with the type of log stream that encountered the write error. The actions based upon the *lstype* are:

RM DATA
If RRS was initializing when the error occurred and RRS needed to update the log to complete initialization, then RRS initialization fails.

Otherwise, any RRS function that must update the RM DATA log stream will fail. These functions include log takeover processing for another system and RM restarts. RRS will continue to attempt to write to the RM DATA log stream on subsequent requests that require updates to the log. If a write succeeds, RRS will delete this message.

MAIN UR
RRS stops logging to the MAIN UR log stream on system *sysname*. All UR state log records for *sysname* are logged to the DELAYED UR log stream for the remainder of the life of the RRS address space on *sysname*.

DELAYED UR
RRS address space on system *sysname* terminates.

RESTART
RRS functions that must update the RESTART log fail. These functions include log takeover, remove interest, and resolve an **in-doubt** condition.

ARCHIVE
RRS stops logging to the ARCHIVE log stream on system *sysname* for the remainder of the life of the RRS address space on *sysname*.

This message will be deleted when the RRS address space terminates.

Operator Response: Find message ATR216I and inform the system programmer.

System Programmer Response: The response varies with the type of log stream, as follows:

RM DATA
You need to correct the error or cold start.

To correct the error, find message ATR216I and follow the system programmer response for that message. Once RRS can write to the RM data log stream, it will delete this message.

If you cannot correct the error, you will need to cold start the RRS group by deleting and then redefining the RM DATA log stream definition in the LOGR policy.

MAIN UR
You can either try to fix the problem or have RRS run without logging to the MAIN UR log stream.

Fixing the problem: If you try to fix the problem, you will need to determine the error condition returned by the system logger. Locate message ATR216I and follow the system programmer response for that message. Then, cancel RRS on system *sysname* and restart it to have it begin using the log stream again.

If you cannot correct the problem and you want to have RRS use the MAIN UR log stream, you will need to cancel RRS and start RRS with a different log group name.

Running without a MAIN UR log stream: If you choose to run RRS without logging to the MAIN UR log stream, consider the following:

1. Performance considerations

   Because system *sysname* is now logging all its UR state log entries to the DELAYED UR log as opposed to both the MAIN UR and DELAYED UR log streams, RRS performance may degrade as a result of the increased logging activity on the DELAYED UR log stream.

   Because system *sysname* is now logging all its UR state log entries to the DELAYED UR log stream, as opposed to both the MAIN UR and DELAYED UR log streams, the amount of data in the DELAYED UR log stream will increase. Consider monitoring the DELAYED UR log stream to ensure the log stream does not run out of log data set directory space. You can use the LOGR policy utility LIST function to monitor the log data set usage. You might also consider formatting DSEXTENT records in your LOGR couple data set if you have not already done so. This action will allow the log stream to extend its log data set directory, if necessary.

DELAYED UR
Determine the error condition returned by the system logger. Locate message ATR216I and follow the system programmer response for that message to correct the problem, then restart the RRS address space on *sysname*.

If you cannot correct the problem, consider starting RRS with a different log group name.

RESTART
Determine the error condition returned by the system logger. Locate message ATR216I and follow the system programmer response for that message to correct the problem. Once RRS can successfully write to the RESTART log stream on *sysname*, it deletes this message.

If you cannot correct the problem, consider either deleting and redefining the RESTART log stream or starting RRS with a different log group name. In either case, you will need to bring down all members of the RRS group, redefine (define) the log stream(s), and then restart the members of the RRS group.

ARCHIVE
You can either try to fix the problem or have RRS run without logging to the ARCHIVE log stream.

Fixing the problem: If you try to fix the problem, locate message ATR216I to determine the error condition the system logger returned and follow the system programmer response for that message. Then, cancel RRS on system *sysname* and restart it to have it begin using the log stream again.

If you cannot correct the problem and you want to have RRS use the ARCHIVE log stream, you will need to cancel RRS and start RRS with a different group name.

Running without an ARCHIVE log stream: If you choose to run without an ARCHIVE log stream, RRS will not log completed units of recovery (URs) to the ARCHIVE log stream.

ATR306I RESOURCE MANAGER *rmname* **CAUSED A** *hmcond* **CONDITION FOR URID =** *uridentifier*

Explanation: RRS has detected a heuristic condition while processing the unit of recovery (UR) identified in the message; RRS records this exceptional condition in LOGREC.

In the message text:

rmname
is the resource manager name.

hmcond
One of the following:

HEURISTIC-MIXED
A heuristic-mixed condition.

HEURISTIC COMMIT
A heuristic commit condition.

HEURISTIC RESET
A heuristic reset condition.

HEURISTIC-MIXED BACKOUT
A heuristic-mixed backout condition.

HEURISTIC-MIXED COMMIT
A heuristic-mixed commit condition.

OK-OUTCOME-PENDING
An OK outcome pending condition.

BACKOUT-OUTCOME-PENDING
A BACKOUT outcome pending condition.

uridentifier
is URID for the specified UR

Source: Resource Recovery Services (RRS)

Detecting Module: ATRSMEXB

System Action: The system action depends on which heuristic condition was detected.

HEURISTIC-MIXED
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

HEURISTIC COMMIT
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

HEURISTIC RESET
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

HEURISTIC-MIXED BACKOUT
RRS records this exceptional condition in LOGREC and backs out the UR.

HEURISTIC-MIXED COMMIT
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

BACKOUT-OUTCOME-PENDING
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

Operator Response: None.

System Programmer Response: Provide the symptom record to your IBM Support Center.

AVM Messages

AVM001I AVM IS INITIALIZED

Explanation: The system successfully initialized the availability manager.

Source: Availability manager

Detecting Module: AVFSR

System Action: The system continues processing.

AVM002I AVM START REJECTED, AVM IS ALREADY ACTIVE WITH ASID=*asid*

Explanation: When initializing the availability manager, the system found that another availability manager address space is active. One of the following may have caused this problem:

- A subsystem requested availability manager services.
- The system issued an internal START command in response to a request by the information management system (IMS).
- The system is ending the availability manager.
- The system ended the availability manager previously without releasing all of its resources.
- Storage containing availability manager control blocks was overlaid.

In the message text:

asid The address space identifier (ASID) of the address space where the availability manager is already active.

Source: Availability manager

Detecting Module: AVFMB

System Action: The system rejects the second START command.

Operator Response: Wait until message AVM010E appears. Then enter the START command again. If the error persists, notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AVM004I TAKEOVER IN PROGRESS FOR SUBSYSTEM *ssid*, {ACTIVE|BACKUP} ELEMENT OF RSE *rsename*

Explanation: The availability manager began a takeover for a subsystem.

In the message text:

ssid The subsystem identifier.

rsename The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.

Source: Availability manager

Detecting Module: AVFKP

System Action: The system does one of the following:

- When **ACTIVE** appears in the message, the failing active subsystem does not perform any I/O operations to the subsystem's data bases. The system displays message AVM004I on the system containing the failing active subsystem. When I/O prevention is complete, the system issues message AVM006E.
- When **BACKUP** appears in the message, the availability manager and the alternate subsystem begin takeover processing for the failing active subsystem. Message AVM004I is displayed on the system containing the alternate subsystem.

AVM005A REPLY UNLOCK WHEN I/O PREVENTION COMPLETES FOR RSE *rsename*

Explanation: An alternate subsystem is taking over for a failing active subsystem.

In the message text:

rsename The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.

Source: Availability manager

Detecting Module: AVFWA

System Action: The system issues this message on the system where the alternate subsystem is running.

Operator Response: Check if the active subsystem completed I/O prevention by looking for an occurrence of message AVM006E that contains the same RSE name specified in message AVM005A. Do one of the following:

- If you find a match, reply UNLOCK to message AVM005A.
- If you do not find a match, do one of the following to stop I/O for the failing active subsystem:
  - Switch the direct access storage device (DASD).
  - Perform a system reset.

  Then reply UNLOCK to message AVM005A.

AVM006E TELL OPERATOR AT BACKUP TO REPLY "UNLOCK" TO MESSAGE AVM005A. I/O PREVENTION IS COMPLETE FOR SUBSYSTEM *ssid*, FAILING ACTIVE ELEMENT OF RSE *rsename*.

Explanation: The availability manager completed I/O prevention for a failing active subsystem. The alternate subsystem can now provide full data access.

In the message text:

ssid The subsystem identifier.

rsename The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.

Source: Availability manager

Detecting Module: AVFIW

System Action: The availability manager completes takeover processing for the failing active subsystem.

The system does not issue message AVM005A, or deletes message AVM005A before the operator can reply, when:

- No alternate subsystem for the RSE connected to the availability manager.
- A connected alternate subsystem does not have to be notified of I/O prevention completion.

Operator Response: Delete message AVM006E from the console. If the system issues message AVM005A, reply UNLOCK on the system where the alternate subsystem is running.

© Copyright IBM Corp. 1988, 1999

AVM007I SUBSYSTEM *ssid* ASID *asid* IS NOW THE {ACTIVE|BACKUP} ELEMENT OF RSE *rsename*

Explanation: A subsystem is the either the active or the backup element of a recoverable service element (RSE).

In the message text:

ssid The subsystem identifier.

asid The address space identifier.

rsename The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.

ACTIVE One of the following occurred:

- The subsystem completed initialization and is active.
- An alternate subsystem completed takeover of a failing active subsystem.

BACKUP The alternate subsystem is ready to take over for the active subsystem, if necessary.

Source: Availability manager

Detecting Module: AVFNS

System Action: Depending on the message text, the system establishes the subsystem as the active or alternate element of the RSE.

AVM008I INVALID REPLY TO MESSAGE "AVM*nnn*"

Explanation: The operator entered an incorrect reply to message AVM*nnn*.

Source: Availability manager

Detecting Module: AVFMS

System Action: The system issues message AVM*nnn* again.

Operator Response: Enter a correct reply to message AVM*nnn*.

AVM010E AVM ENDED ABNORMALLY (ABEND=S*cde* REASON=*reason-code*)

Explanation: The availability manager address space ended abnormally.

In the message text:

S*cde* The system completion code.

reason-code The reason code. If no reason code exists, NONE appears in this field.

Source: Availability manager

Detecting Module: AVFMH

System Action: The availability manager releases its resources and ends. Data about subsystems previously defined to the availability manager may be lost. If availability manager is restarted, the subsystems must redefine themselves to the availability manager.

Operator Response: Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AVM011E ENSURE A TAKEOVER IS IN PROGRESS FOR THE {ACTIVE|BACKUP} ELEMENT OF RSE *rsename*

Explanation: The system issues this message twice after issuing message AVM004I.

In the message text:

rsename The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.

ACTIVE The message appears on the system console for the specified BACKUP element.

BACKUP The message appears on the system console for the failing ACTIVE element.

Source: Availability manager

Detecting Module: AVFKP

System Action: If **BACKUP** appears in the message text, the system deletes the message when I/O prevention is complete.

If **ACTIVE** appears in the message text, the system deletes the message when the backup subsystem takes over.

Operator Response: Do the following:

- When **BACKUP** appears in the message, ensure that a takeover is in progress for the RSE on the alternate subsystem. If a takeover is not in progress, enter the IMS SWITCH command to initiate takeover.
- When **ACTIVE** appears in the message, ensure that a takeover is in progress for the RSE on the active subsystem. If a takeover is not in progress, enter the IMS SWITCH command to start a takeover.

  If you cannot start a takeover, do one of the following to disable the system:

  – Switch the direct access storage device (DASD).

  – Perform a system reset.
- If you disabled the system, reply UNLOCK to message AVM005A.

AVM012E INITIATE MANUAL I/O PREVENTION FOR SUBSYSTEM *ssid*, FAILING ACTIVE ELEMENT OF RSE *rsename*. I/O PREVENTION COULD NOT BE INITIATED BY AVM.

Explanation: The availability manager could not prevent a failing active subsystem from performing I/O to external data base(s) shared with the backup subsystem.

In the message text:

ssid The subsystem identifier.

rsename The recoverable service element (RSE) that contains the failing subsystem.

Source: Availability manager

Detecting Module: AVFLT

System Action: The availability manager removes the failing active subsystem from the RSE. The system takes an SVC dump. The system may write a logrec data set error record.

Operator Response: Do the following:

- Disable the system on which message AVM012E appears by doing one of the following:

  – Switch the direct access storage device (DASD).

  – Perform a system reset.
- Reply UNLOCK to message AVM005A if message AVM005A was issued on the system where the alternate subsystem is running.
- Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AVM022I AVM START FAILED (ABEND=S*cde*,REASON=*reason-code*)

Explanation: The system could not build a new address space for the availability manager.

In the message text:

S*cde* The abend code.

reason-code The reason code. If no reason code exists, **NONE** appears in this field.

Source: Availability manager

Detecting Module: AVFJA

System Action: The system does not initialize a new availability manager. The system writes an SVC dump. The system may write a logrec data set error record.

Operator Response: Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AVM031I SUBSYSTEM *ssid* ASID *asid* CONNECTION TO AVM COMPLETED

Explanation: A subsystem in the specified address space successfully connected to the availability manager.

In the message text:

ssid The subsystem identifier.

asid The address space identifier (ASID) of the address space where the subsystem is running.

Source: Availability manager

Detecting Module: AVFJA

System Action: The system connects the availability manager and the subsystem. The system routes this message to the system log.

AVM032I SUBSYSTEM *ssid* ASID *asid* CONNECTION TO AVM FAILED (REASON CODE=*reason-code*)

Explanation: A subsystem failed to connect to the availability manager. When requesting the connection, the subsystem issued the CALLAVM macro with the TYPE=JOINAVM parameter.

In the message text:

ssid The subsystem identifier.

asid The identifier for the address space where the subsystem is running.

reason-code The reason code. If no reason code exists, **NONE** appears in this field.

Source: Availability manager

Detecting Module: AVFJA

System Action: The system routes this message to the system log. The system continues processing.

Operator Response: Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AVM033I SUBSYSTEM *ssid* ASID *asid* CONNECTION TO RSE *rsename* COMPLETED

Explanation: A subsystem became a member of the specified recoverable service element (RSE).

In the message text:

ssid The subsystem identifier.

asid The address space identifier (ASID) of the address space where the subsystem is running.

rsename The recoverable service element (RSE) formed by the subsystem and an alternate subsystem.

Source: Availability manager

Detecting Module: AVFJB

System Action: The system routes this message to the system log. The system continues processing.

AVM034I SUBSYSTEM *ssid* ASID *asid* CONNECTION TO RSE *rsename* FAILED (REASON CODE = *reason-code*)

Explanation: The availability manager could not make a subsystem a member of a recoverable service element (RSE). The subsystem asked to become a member of the RSE by issuing the CALLVM macro with the TYPE=JOINRSE parameter.

In the message text:

ssid The subsystem identifier.

asid The address space identifier (ASID) of the address space where the subsystem is running.

rsename The RSE for which the subsystem requested membership.

reason-code The reason code. If no reason code exists, **NONE** appears in this field.

Source: Availability manager

Detecting Module: AVFJB

System Action: The system routes this message to the system log. The system continues processing.

Operator Response: Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AVM035I SUBSYSTEM *ssid* ASID *asid* TERMINATION FROM AVM {COMPLETED|IN PROGRESS} OPTION = {NORMAL|ABEND}

Explanation: The availability manager has disconnected, or is disconnecting, a subsystem.

One of the following occurred:

- The subsystem asked to disconnect from the availability manager.
- The availability manager found that the address space containing the subsystem ended.

In the message text:

ssid The subsystem identifier.

asid The address space identifier (ASID) of the address space where the subsystem is running.

IN PROGRESS AVM is disconnecting the specified subsystem.

COMPLETED AVM successfully disconnected the specified subsystem.

NORMAL The subsystem ended normally.

ABEND The subsystem ended abnormally.

Source: Availability manager

Detecting Module: AVFLA

System Action: If **COMPLETED** appears in the message, the availability manager disconnected the subsystem. The system continues processing.

If **IN PROGRESS** appears in the message, the system removes the subsystem from a recoverable service element (RSE) if it was part of an RSE. Then the availability manager disconnects the subsystem. The system issues message AVM035I again with COMPLETED in the text.

System Action: The system routes this message to the system log. The system continues processing.

AVM036I SUBSYSTEM *ssid* **ASID** *asid* **TERMINATION FROM AVM FAILED OPTION {NORMAL|ABEND} (REASON CODE =** *reason-code***)**

Explanation: A subsystem asked to be disconnected from the availability manager. The subsystem issued the CALLAVM macro with the TYPE=LEAVEAVM parameter.

In the message text:

ssid The subsystem identifier.

asid The address space identifier (ASID) of the address space where the subsystem is running.

NORMAL The subsystem ended normally.

ABEND The subsystem ended abnormally.

Source: Availability manager

Detecting Module: AVFLA

System Action: The availability manager stops processing the request. The system routes this message to the system log.

Operator Response: Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AVM037I SUBSYSTEM *ssid* **ASID** *asid* **TERMINATION FROM RSE** *rsename* **COMPLETED, OPTION = {IOP|TAKEOVER|NORMAL}**

Explanation: To remove a subsystem from a recoverable service element (RSE), the availability manager issued the CALLAVM macro with the TYPE=LEAVERSE parameter. In the message text:

ssid The subsystem identifier.

asid The address space identifier (ASID) of the address space where the subsystem is running.

rsename The RSE from which the availability manager removed the subsystem.

NORMAL The subsystem requested a LEAVERSE with OPTION=NORMAL.

TAKEOVER The subsystem requested a LEAVERSE with OPTION=TAKEOVER.

IOP The subsystem requested a LEAVERSE with OPTION=IOP (I/O prevention).

Source: Availability manager

Detecting Module: AVFLR

System Action: The system issues message AVM037I. The system issues message AVM039I. The availability manager removes the subsystem from the RSE.

AVM038I SUBSYSTEM *ssid* **ASID** *asid* **TERMINATION FROM RSE** *rsename* **FAILED, OPTION = {NORMAL|TAKEOVER|IOP} (REASON CODE =** *reason-code***)**

Explanation: The availability manager failed to remove a subsystem from a recoverable service element (RSE). The subsystem issued a CALLAVM macro with the TYPE=LEAVRSE parameter.

In the message text:

ssid The subsystem identifier.

asid The address space identifier (ASID) of the address space where the subsystem is running.

rsename The RSE from which the availability manager removed the subsystem.

NORMAL The subsystem requested a LEAVERSE with OPTION=NORMAL.

TAKEOVER The subsystem requested a LEAVERSE with OPTION=TAKEOVER.

IOP The subsystem requested a LEAVERSE with OPTION=IOP (I/O prevention).

reason-code The reason code. If no reason code exists, **NONE** appears in this field.

Source: Availability manager

Detecting Module: AVFLR

System Action: The availability manager stops processing the request. The system routes this message to the system log.

Operator Response: Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AVM039I SUBSYSTEM *ssid* **ASID** *asid* **TERMINATION FROM RSE** *rsename* **COMPLETE**

Explanation: The availability manager removed a subsystem from a recoverable service element (RSE). The request to remove the subsystem came from one of the following:

- The subsystem itself
- The availability manager

In the message text:

ssid The subsystem identifier.

asid The address space identifier (ASID) of the address space where the subsystem is running.

rsename The RSE from which the availability manager removed the subsystem.

Source: Availability manager

Detecting Module: AVFLR

System Action: The system issues message AVM039I. The system issues message AVM037I. The system continues processing.

LAN Server Messages (BFS)

Each message produced by LAN Server on an MVS system is preceded by an 10-character prefix of the form **BFSxxxnnnns**:

BFS The LAN Server product code

xx Task identifier

nnnn Message number

s Severity code

- **E** Error. Operator action is required. LAN Server continues to function.
- **I** Information. Operator action is not required.
- **W** Warning. Operator action may be required.

LAN Server on a Front-end Processor; uses OS/2 facilities for displaying messages. With these facilities, prefixes are displayed in the form **BFSnnnn**:

BFS The LAN Server product code

nnnn Message number

Note: Some messages associated with CLAW initialization do not have prefixes. These messages are listed in alphabetic order at the end of this chapter.

BFSxx0000E LAN Server host file server program has ended abnormally with code *abend-code***.**

Explanation: LAN Server multitasking supervisor has encountered a situation it cannot handle.

Source: LAN Server

System Action: LAN Server ends. If SYSMDUMP has been allocated, a storage dump is produced.

User Response: Contact your IBM Service Representative with the abend code and the dump, if any. Restart LAN Server.

30 Request Queues were damaged.

31 Data structure of the storage manager was damaged.

40 PQE lock error.

41 PQE pipe error.

42 Timer error.

43 Fast fit buffer lock error.

44 Control block lock error.

50 Source page header failed validation.

51 Source page header was not on page boundary.

52 Source page header eyecatcher was not valid.

53 Source page header unused slot count was not valid.

54 Source page header offset to unused slot was not valid.

55 Error from allocate.

56 Header error on global block.

61 Invalid user block.

62 Lock manager error.

BFSxx0001I Your *command* **command is complete.** or **Your ERASE command is complete.** or **Your LIST command is complete.**

Explanation: A previously entered command has completed execution.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0002E Error allocating storage for task *tcbid***.**

Explanation: LAN Server could not allocate the necessary storage. The task identifier is the name of the task attempting allocation.

Source: LAN Server

System Action: None

User Response: Check storage requirements and increase the region size of the file server host program server if necessary.

BFSxx0004E LAN Server ended with a program check.

Explanation: A program check interrupt occurred.

Source: LAN Server

System Action: LAN Server ends. If SYSMDUMP has been allocated, a storage dump is produced.

User Response: Notify the system programmer so that problem determination can begin and an IBM Service Representative can be called.

BFSxx0005E Logical record length of *execname* **is greater than 1200.**

Explanation: The file *execname* was determined to have a Logical Record Length (LRECL) of greater than 1200 bytes. LAN Server supports a maximum LRECL of 1200 bytes for the EXEC command.

Source: LAN Server

System Action: The EXEC is not run. Processing continues.

User Response: Reduce the LRECL of the file *execname* to 1200 or less and reenter the command.

BFSxx0009E The LINK *fepname* **is already defined.**

Explanation: The *fepname* on the LINK configuration file record has been used in a previous LINK.

Source: LAN Server

System Action: The record is not processed.

User Response: Correct the affected configuration file record. Restart LAN Server.

BFSxx0010E *text_of_invalid_configuration_file_record*

Explanation: This message is displayed whenever a configuration file record is not processed because of an error.

Source: LAN Server

System Action: None.

User Response: See the preceding associated error message(s).

© Copyright IBM Corp. 1988, 1999

BFSxx0011E Invalid configuration type record.

Explanation: The record name of a configuration file record is not valid. The problem configuration record is displayed immediately before this message.

Source: LAN Server

System Action: The record is not processed.

User Response: Correct the affected configuration file record. Restart LAN Server.

BFSxx0012E The configuration record is out of order.

Explanation: Self-explanatory.

Source: LAN Server

System Action: The record is not processed.

User Response: Move the affected configuration file record. Restart LAN Server.

BFSxx0013E The configuration file, *configuration_file***, cannot be found.**

Explanation: The specified configuration file does not exist.

Source: LAN Server

System Action: LAN Server ends.

User Response: Create the necessary configuration file and restart LAN Server.

BFSxx0014E The LINK address is not valid.

Explanation: The address field in the LINK record of the configuration file is in error. If the error is on a LINK record of type CLAWVDO, then the address range specified (i.e. address and subchannel pair count) is in error. The possible reasons for this error are

- The address range contains addresses less than 0100.
- The address range contains addresses greater than FFFD.
- The address range contains the reserved addresses of 0FFE and 0FFF.
- The address range contains addresses on more than one channel (e.g. 03FE..0401).

Source: LAN Server

System Action: The configuration record is not processed.

User Response: Correct the affected configuration file record. Restart LAN Server.

BFSxx0015E The host internet address is not valid.

Explanation: The host internet address in the LINK record of the configuration file is in error.

Source: LAN Server

System Action: The record or command is not processed.

User Response: Correct the affected configuration file record. Restart LAN Server.

BFSxx0016E The LINK type is not valid.

Explanation: The configuration file LINK record has a type field that is not valid.

Source: LAN Server

System Action: The record is not processed.

User Response: Correct the affected configuration file record. Restart LAN Server.

BFSxx0017E The LINK address was already defined.

Explanation: A configuration file LINK record has an ADDRESS field which was defined in a previous LINK record, or the address range specified on the LINK record (i.e. address and subchannel pair count) overlaps the address range specified on a previous LINK record.

Source: LAN Server

System Action: The configuration record is not processed.

User Response: Correct the affected configuration file record. Restart LAN Server.

BFSxx0018E An SMB FEP link cannot be activated unless OLS ON is specified in the CONFIG configuration file. or **An NFS FEP link cannot be activated unless NFS ON is specified in the CONFIG configuration file.**

Explanation: Before activating a CLAW link to a front-end processor, the corresponding feature must be started by the OLS or NFS record in the CONFIG configuration file.

Source: LAN Server

System Action: This record or command is not processed.

User Response: Specify OLS ON or NFS ON in the CONFIG configuration file. Retry the FEP link activation.

BFSxx0026E Incorrect number of parameters. or **Incorrect number of parameters on** *record* **record.**

Explanation: The configuration file record contains an incorrect number of parameters.

Source: LAN Server

System Action: The record is not processed. If CODEPAGE is the record in error, LAN Server ends.

User Response: Correct the affected configuration file record. Restart LAN Server.

BFSxx0033E The value is not valid.

Explanation: The value specified on the associated configuration file record is not in the valid range.

Source: LAN Server

System Action: The record is not processed. The default value is used.

User Response: Check the valid range of values. Correct the configuration file record. Restart LAN Server.

BFSxx0035E Error code *ferror* **from reading the configuration file.** or **Error code** *ferror* **from reading the** *dsname* **file.**

Explanation: An I/O error occurred while reading or opening the data set. The error code was received from the C ferror routine. For the list of *ferror* numbers, refer to the Ferror Messages Table in the Run-Time Codes Appendix in the *OS/390 Language Environment Programming Guide*.

Source: LAN Server

System Action: LAN Server ends.

User Response: Correct the cause of the I/O error. Restart LAN Server.

BFSxx0036E The LINK record RPAGES/WPAGES value is not valid.

Explanation: The value following the RPAGES or WPAGES keyword on the LINK record in the configuration file is either missing or not within the valid range of 16 to 63. If not specified, the default value is 16.

Source: LAN Server

System Action: The value from the LINK record is not processed. The default value is used.

User Response: Correct the LINK record in the configuration file.

BFSxx0037E Invalid parameter *parm* **on the LINK record.**

Explanation: The LINK record in the configuration file contains an unknown keyword parameter.

Source: LAN Server

System Action: The record parameter is not processed. The default value is used.

User Response: Correct the LINK record in the configuration file.

BFSxx0040I LAN Server Version *version.release.level***, built** *timestamp***, is ready.**

Explanation: LAN Server is initialized and ready for use.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0041E Task *tcbid* **was posted for an unsupported service.**

Explanation: This is a system program error. The affected task has been posted for an event which it is not programmed to handle.

Source: LAN Server

System Action: The task ends.

User Response: If the problem persists, start local diagnostic procedures for handling system program problems.

BFSxx0045E "*string***" is not a valid command.**

Explanation: The expression *string* is not a valid File Server command.

Source: LAN Server

System Action: The command is not processed.

User Response: Enter the intended command in correct format.

BFSxx0046E Task *tcbid* **Return Code** *return-code* **from attach while attaching task** *task_name***.**

Explanation: System program error. An attempt to attach a new task failed with the specified return code.

Source: LAN Server

System Action: When a front-end processor service task (LCOM) could not be attached, the connecting front-end processor remains unattached but LAN Server continues to run.

User Response: Attempt to reconnect the front-end processor or restart the file server host program. If the problem persists, start local diagnostic procedures for handling system program problems.

BFSxx0047E Task *tcbid* **could not allocate storage for the** *control_block_name* **control block.**

Explanation: A new communications link was trying to be started, but LAN Server could not get the necessary storage.

Source: LAN Server

System Action: The session of the user is ended, but LAN Server continues.

User Response: Check storage requirements and increase the region size of the file server host program if necessary.

BFSxx0049E Error *ferror* **occurred on** *c_func* **to the audit file.**

Explanation: A permanent error has occurred using *c_func* to the audit file. The error code *ferror* is the value that the function returned for any C/370 I/O routines.

For the C/370 dynalloc routine, the *ferror* is the decimal format of the two-byte SVC 99 dynamic allocation information code (high order half word) and the two-byte dynamic allocation error code (low order half word). After this value has been converted to hexadecimal, the codes can be looked up in *OS/390 MVS Programming: Assembler Services Reference* (Requesting SVC 99 Functions section). If a Direct Access Device Space Management (DADSM) allocation error occurred, use the DFP publications.

Source: LAN Server

System Action: End writing to the audit file.

User Response: Determine the reason for the error and take corrective action.

BFSxx0050I *command_text*

Explanation: Displayed text of a previously entered file server command.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0051I LAN Server Version *n***, Release** *nn***, Level** *nnnn***, built** *timestamp***.**

Explanation: Response to a null command to LAN Server, giving the current release level.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0053E Error *ferror* **occurred while reading** *exec***.**

Explanation: The *ferror* value is a return code from C/370, typically indicating that the EXEC could not be found. For the list of *ferror* numbers, refer to the Ferror Messages Table in the Run-Time Codes Appendix in the *OS/390 Language Environment Programming Guide*.

Source: LAN Server

System Action: The EXEC command is not processed.

User Response: Enter the command again. If the error persists, check the *exec* file server file.

BFSxx0055E Error *ferror* **occurred while opening** *dsname***.** or
Unknown error occurred while opening *dsname***.**

Explanation: The *ferror* return code is from the C FOPEN routine, or an unknown error occurred. The DD name or data set name *dsname* was not found (for example, DD:LFSEXEC(PROFILE) where the PROFILE member does not exist); or on the COPY command, either the DCB parameters do not agree with an existing data set or the data set cannot be opened for writing while in use by another user. For the list of *ferror* numbers, refer to the Ferror Messages Table in the Run-Time Codes Appendix in the *OS/390 Language Environment Programming Guide*.

Source: LAN Server

System Action: The command is ended.

User Response: Check the *exec* DD name or data set name and enter the command again. Verify the *exec* can be accessed when the command is entered. If the error is unknown contact your system administrator.

If the message is issued from the COPY command, be sure that the DCB characteristics specified agree with the existing data set.

BFSxx0056E Invalid subcommand *name* **on** *command* **command.**

Explanation: The specified subcommand (parameter on the command line) is not valid for the specified command.

Source: LAN Server

System Action: The command is not processed.

User Response: Reenter the command with valid parameters.

BFSxx0060E FEP *fepname* **is already started.**

Explanation: The specified *fepname* was used on a START command, but that front-end processor is already started.

Source: LAN Server

System Action: The command is not processed.

User Response: Use the QUERY FEP command to find out which front-end processors are already active.

BFSxx0065E FEP *fepname* **is not active.**

Explanation: The specified *fepname* was used in a DROP or QUERY FEP command, but the front-end processor is currently not started.

Source: LAN Server

System Action: The command is not processed.

User Response: None.

BFSxx0066E QUERY FEP PROCESSING ERROR FEPNAME:
fepname **RC=***return-code*

Explanation: There was an error in processing the QUERY FEP STATUS command for FEPNAME: *fepname*. The RC in the message identifies the error.

RC=1004 FEP *fepname* has not responded to the host within three seconds. The front-end processor may be processing other requests or communications between the front-end processor and the host may have terminated. Retry the command.

RC=1008 The QUERY FEP STATUS command has timed out before the FEP responded. A reply comes back from the FEP, The message is sent to SYSLOG ,SYSPRINT data set of LFS PROC and LFS AUDIT log data set

RC=1012 The FEP does not support the QUERY FEP STATUS command.

Any other RC Notify the system programmer to start problem determination. Contact an IBM Service Representative.

Source: LAN Server

System Action: Processing continues.

User Response: See explanation

BFSxx0081I FEP *fepname* **Type CLAW Address**
first_address/*last_address* **Users** *nnnnnn status***.** or
FEP *fepname* **Type CLAWNFS Address**
first_address/*last_address* **Users** *nnnnnn status***.**

Explanation: This message is produced in response to a QUERY LINK *fepname* command. The parts of the message are as follows:

- The address values are the device numbers being used for the CLAW communications link. The full number of the *first_address* is displayed. Only the subchannel is displayed for the *last_address*. If, for example, addresses 1234 and 1235 were being used, they would be displayed as 1234/35. CLAW always uses an even/odd pair for reading and writing, respectively.
- The users value shows the number of logical links active on the CLAW connection to the front-end processor. For CLAW and CLAWNFS links, only one logical link can be active on a given front-end processor.
- The *status* value may be:

  CONNECT CLAW has established a hardware connection.

  ACTIVE A CLAW link has been started but a hardware connection has not yet been established.

  DOWN CLAW has not been started for this front-end processor.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0082E VSPOOL1 storage exhausted.

Explanation: The file server was unable to obtain required storage from VSPOOL1 for critical processing.

Source: LAN Server

System Action: None.

User Response: The file server host program does not have enough storage in VSPOOL1. Increase the VSPOOL1 size and then restart the file server host program.

BFSxx0083E Fatal update error for dataset *dataset*.

Explanation: The file server encountered a fatal error while attempting to update dataset *dataset*.

Source: LAN Server

System Action: The dataset is disabled for updates.

User Response: If this message was accompanied by one or more out of storage errors, restart the file server host program with a larger VSPOOL1 size. For any other situation contact IBM support personnel.

BFSxx0093E FEP name *fepname* was not found.

Explanation: A START or QUERY command was entered but the specified front-end processor is not defined in the CONFIG configuration file.

Source: LAN Server

System Action: None.

User Response: Verify that the front-end processor name is defined in the CONFIG configuration file. Reenter the command.

BFSxx0094I TRACE SYSTEM ON or **TRACE SYSTEM OFF**

Explanation: This message is a response to a QUERY command with the TRACE option indicating the current trace system setting.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0100I LAN Server is ending.

Explanation: LAN Server is now stopping because of a SHUTDOWN command.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0104I FEP *fepname* Address *xxxx* Status is CONNECT. or **NFS FEP *fepname* Address *xxxx* Status is CONNECT.**

Explanation: The CLAW driver has successfully established a connection to the channel adapter card in a front-end processor.

Source: LAN Server

System Action: The system is now ready to accept a Session Connect request from the front-end processor.

User Response: None.

BFSxx0238E A write error occurred on DD SYSTRACE. Tracing is stopped.

Explanation: An attempt was made to write trace data to the SYSTRACE DD when it was determined that a write error occurred.

Source: LAN Server

System Action: No more data can be written to the indicated output device. Tracing has been ended.

User Response: Reenter the original trace command to reestablish tracing. This will over-write the current contents of the data set.

BFSxx0239I The AUTHORIZ table is empty.

Explanation: In response to a QUERY AUTHORIZ command, this message indicates that there are no entries in the table.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0267I *applid* is added to the AUTHORIZ table.

Explanation: An entry for the specified VTAM APPLID has been added to the table in storage.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0268I *applid* is deleted from the AUTHORIZ table.

Explanation: The entry for the specified VTAM APPLID has been deleted from the table in storage.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0299E The file server task *tcbid* is stopping due to a program check.

Explanation: A program check occurred during execution of the associated task. The program check routine of that task has been entered.

Source: LAN Server

System Action: Dump the storage for LAN Server and end the task.

User Response: If problem persists, start local diagnostic procedures for handling system program problems.

BFSxx0312I FEP *fepname* is starting.

Explanation: A START command was entered for the specified front-end processor and the CLAW task has been initiated.

Source: LAN Server

System Action: The CLAW task is started.

User Response: None.

BFSxx0313I The file server host program system shutdown has started.

Explanation: This is an informational message indicating that the file server SHUTDOWN command has been run and processing has started.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0318I *name* **is starting.** or **Starting LAN communication task for FEP** *fepname* **on conversation id** *convid* **to server** *tpn***.** or **Starting communication task for administrator** *userid* **on conversation id** *convid* **to server** *tpn***.**

Explanation: This message indicates that the specified task is being started.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0319I Task *name* **is stopping.** or **LAN communication task serving FEP** *fepname* **on conversation id** *convid* **is stopping.** or **Communication task serving administrator** *userid* **on conversation id** *convid* **is stopping.** or **Communication task connected to** *userid* **on conversation id** *convid* **is stopping.** or **NFS Communication task connected to** *jobname* **on socket** *socknum* **is stopping.**

Explanation: This is an informational message indicating that the specified task is stopping. If an APPC task encountered a problem before establishing its APPC/VTAM path, the conversation ID is zero.

Source: LAN Server

System Action: None.

User Response: If the task is stopping because of a problem, another message accompanies this one. Any required response is indicated in the description for the accompanying message.

BFSxx0320I Attempting to re-establish TCP/IP communication.

Explanation: The file server host program is attempting to re-establish TCP/IP communication through the TCP/IP server. This message will be preceded by another message describing the condition that caused communication to be lost. Until TCP/IP communication is re-established, the file server host program will not receive any new requests from NFS clients through TCP/IP, but any other file services (for example, OS/2 LAN or administration services or any new NFS requests through NFS front-end processors) continue to be available to their clients. Once TCP/IP communication is re-established, file services will reclaim its UDP ports with the portmapper and then NFS clients may continue communicating with the file server host program through this address space.

Source: LAN Server

System Action: The file server host program continues its attempts to restart TCP/IP communication until those attempts succeed or until a SHUTDOWN command is issued.

User Response: Use the error message that precedes this message to determine the cause of the communication problem.

BFSxx0322I NFS file services are now available on socket *socknum***.**

Explanation: All initialization steps for NFS communications through the TCP/IP address space are complete. NFS clients may now communicate with the file server host program through the address space.

Source: LAN Server

System Action: None. This is an informational message.

User Response: Workstation users may now use NFS file services.

BFSxx0371E The AUDIT record size value must be from 1 to 1000.

Explanation: The SIZE value on the AUDIT configuration record or administration command is not within the valid range.

Source: LAN Server

System Action: The record or command is ignored.

User Response: Correct the affected record or command. Restart LAN Server.

BFSxx0385E *** Notify System Programmer of LAN Server DUMP *******

Explanation: LAN Server has taken a storage dump because of either a program check or a buffer manager problem, but is attempting to continue running.

Source: LAN Server

System Action: None.

User Response: Because a problem has occurred, some component of LAN Server may have been placed in a permanent wait state. If the component is critical, LAN Server may need to be shut down and restarted.

BFSxx0391E LAN Server system task *name* **has program checked.**

Explanation: LAN Server detected a program interrupt condition while the task identified in the message text was executing.

Source: LAN Server

System Action: End the system task.

User Response: Perform problem determination.

BFSxx0392I AUTH: *applid1 applid2 applid3*

Explanation: This message lists the entries in the current AUTHORIZ table. This is the response to a QUERY AUTHORIZ command.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0401W System abend code *cd* **(with reason code** *reason-code***) detected during** *actn*

or

User abend code *cd* **(with reason code** *reason-code***) detected during** *actn*

or

Return code *cd* **(with reason code** *reason-code***) detected during** *actn*

Explanation: File Services host code has detected an abend or an unexpected non-zero return code.

cd The abend code or return code.

reason-code The reason code associated with the abend code or return code.

actn The File Services action being attempting when the problem was detected.

Source: LAN Server

System Action: File Services continues execution. The operation that was in progress at the time of the failure is ended immediately. A dump is not taken.

User Response: This could be a result of a user error or a system error. Based on the *code* and *reason* and *action* provided, consult: *OS/390 MVS Programming: Authorized Assembler Services Guide* or *OS/390 MVS System Codes*.

BFSxx0501I FEP *fepname* **Blocks In** *number* **Out** *number***, Bytes In** *number* **Out** *number***, TCB addr =** *addr***, Work addr =** *addr* or **Actual BW (KB/s) Total:***totactbw* **Used:***usdactbw* **Free:***freactbw*

Explanation: This message is produced in response to a QUERY LINK *fepname* SUMMARY command. It provides a summary of traffic across a channel connection to a front-end processor. The parts of the message are as follows:

- The FEP value is the front-end processor name specified on the QUERY LINK command.
- The Blocks In, Out values are the total number of messages that have been received from, and sent to, this front-end processor, respectively, from when it was started.
- The Bytes In, Out values are the total number of bytes that have been received from, and sent to, this front-end processor, respectively, from when it was started.
- The TCB addr value is the location in virtual storage of the Task Control Block, the major work area for the task running this CLAW driver.
- The Work addr value is the location in virtual storage of the CLAW work area used by the CLAW driver.
- The Total Bandwidth value for version 2 of the message is the bandwidth value that was set on the link record in the configuration file.
- The Actual Free Bandwidth value for version 2 of the message is the amount of bandwidth that has yet to be used on the link.
- The Used Bandwidth value for version 2 of the message is the amount of total bandwidth minus the actual free bandwidth.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx0503E The AUTHORIZ table is full.

Explanation: In response to an AUTHORIZ command or configuration record, this message indicates that there are no empty entries in the table, or the server could not get storage.

Source: LAN Server

System Action: The command is not processed. Use message 1019E to record additional information in SYSPRINT.

User Response: If there are no empty entries in the table, delete an entry in the table or update the CONFIG configuration file and restart LAN Server. If the server could not get any storage, wait until storage demands are less and enter the command again.

BFSxx0505E *applid* **is already in the AUTHORIZ table.**

Explanation: The specified VTAM APPLID is already listed in the table.

Source: LAN Server

System Action: The command or configuration record is not processed.

User Response: Remove any duplicate records from the CONFIG configuration file.

BFSxx0506E *applid* **is not in the AUTHORIZ table.**

Explanation: The specified VTAM APPLID is not in the list of authorized administrators.

Source: LAN Server

System Action: The command is not processed.

User Response: You may want to enter the QUERY AUTHORIZ command to display the list of authorized administrators.

BFSxx0614E The file server is not the manager of resource *tpn* **specified in the allocation request on conversation id** *convid***.**

Explanation: LAN Server is not the manager of the resource (transaction program name) specified in the allocation request which was sent by a front-end processor or administrator. The name is not valid.

Source: LAN Server

System Action: The APPC conversation will be deallocated. No further communication will be allowed on it.

User Response: Check the OLSID and ADMINID records in the CONFIG configuration file. For front-end processor communications, check the OLSID record in the BFS.INI file on the front-end processor. For administrators, verify that the administration name specified on the LFSCMD command is correct.

BFSxx0711E Invalid state condition on APPC conversation id *convid* **from FEP** *fepname***, what received code** *whatrcv***.** or **Invalid state condition on APPC conversation id** *convid* **from Administrator** *id***, what received code** *whatrcv***.**

Explanation: The task servicing the indicated APPC conversation has received a state indication which it cannot handle.

Source: LAN Server

System Action: The LAN communication task ends and causes its partner communication task to stop, thereby severing communications to the front-end processor or administrator on the associated pair of paths.

User Response: Attempt to reconnect the front-end processor or administrator to the file server host program. If the problem persists, start local diagnostic procedures for handling system program problems.

BFSxx0718E APPC handshake error on conversation id *convid***, error type** *nn*

Explanation: The error type meanings are:

1 Initializing handshake message length is incorrect.

2 Initializing message content is not valid.

3 Initializing message specifies an invalid Send state flag.

4 Invalid path state for Receive initialization.

5 Invalid path state for Send initialization.

6 Receive path initializing message is not valid.

7 Invalid conversation type (Mapped not Basic).

Source: LAN Server

System Action: The LAN communication task ends and causes its partner communication task to end, thereby severing communications to the front-end processor/Administrator on the associated pair of paths.

User Response: Contact your IBM Service Representative.

BFSxx0935E The *command* command is not allowed when the file server host program is in SHUTDOWN mode.

Explanation: The specified command is not allowed when the file server host program has entered the SHUTDOWN processing mode.

Source: LAN Server

System Action: The command is not processed.

User Response: None.

BFSxx1001W Error opening file *file*. Processing continues.

Explanation: The system was unable to open the specified configuration file.

Source: LAN Server

System Action: Processing continues using the defaults for accounting and buffer size.

User Response: Ensure that there are no problems with the data set on which the configuration file resides. Use the administration commands to define front-end processors or resources if connection to the file server host program is desired.

BFSxx1002W No *file* file was found. Processing continues.

Explanation: The system was unable to find the specified configuration file.

Source: LAN Server

System Action: Processing continues using the defaults for accounting and buffer size.

User Response: If no configuration file exists, disregard this message. If a configuration file exists, ensure the data set name is specified correctly. Use the administration commands to define front-end processors and resources if connection to the file server host program is desired.

BFSxx1003W No valid *keyword* keyword(s) were found in file *file*. Processing continues using the default value, 'OFF'. or **No valid *keyword* keyword(s) were found in file *file*. Processing continues, using the default buffer size, '*value*'.**

Explanation: No valid *keyword* was found.

Source: LAN Server

System Action: Processing continues, using the default values for any keywords that were not specified.

User Response: If the specified configuration file does not contain the identified keyword, disregard this message. If the specified configuration file contains the identified keywords, ensure that the syntax is correct.

BFSxx1004E Error in the configuration file, line number *number*. "*keyword-value*" specifies an invalid number of bytes. Processing continues.

Explanation: The value for this keyword is not valid.

Source: LAN Server

System Action: Processing continues. This record is not processed.

User Response: Correct the value in the configuration file.

BFSxx1005E Invalid keyword '*keyword*' found.

Explanation: While processing the specified configuration file, a keyword was found which is not valid.

Source: LAN Server

System Action: The keyword is not processed. Processing continues.

User Response: Correct the keyword in the specified configuration file.

BFSxx1006W Error in the configuration file, line number *number*. SHARE '*netname*' was found before a valid FEP record. All SHARE records that follow will be skipped until a valid FEP name is found. Processing continues.

Explanation: A SHARE record was found before a valid FEP record was found.

Source: LAN Server

System Action: The SHARE record is not processed. Processing continues.

User Response: Ensure that all SHARE record(s) appear after valid FEP record(s).

BFSxx1007W Multiple occurrences of the *keyword* keyword were found in the *config* file. The last occurrence, *value*, will be used as the *keyword* value. or **Multiple occurrences of the *keyword* keyword were found in the *config* file. The first occurrence, *value*, will be used as the *keyword* value.** or **Multiple occurrences of the MSGOPTNS keyword were found. The first occurrence will be used.**

Explanation: Multiple *keyword* keywords were found while processing the configuration file. The message indicates which value will be used.

Source: LAN Server

System Action: Processing continues.

User Response: Delete any unwanted *keyword* keywords in the configuration file.

BFSxx1008E Insufficient storage to continue initialization of LAN Server. Processing ends.

Explanation: LAN Server initialization was unable to obtain enough storage to complete processing.

Source: LAN Server

System Action: Processing ends.

User Response: Increase the region size of the file server host program.

BFSxx1009E Error in the file *file*, line number *number*. *keyword-value* does not specify *value* or *value*. Processing continues using the default value *value*.

Explanation: The indicated record must specify one of the two values shown in the message. For example, in an NFSLFS configuration file:.

- The ACCOUNT record must have a value of either ON or OFF; the default value is OFF.
- The SECURITY record must have a value of either LOCAL or EXTERNAL; the default value is LOCAL.

Source: LAN Server

System Action: This record is not processed. Processing continues, using the default value.

User Response: Correct the record in the file in error.

BFSxx1010E A duplicate configuration record was found.

Explanation: A configuration record that is allowed to appear only once in a CONFIG configuration file was found more than once. The record that was duplicated is displayed under this message. The file or DD name along with the line number of the duplicate record in error is displayed with message 1400E.

Source: LAN Server

System Action: Processing continues. The duplicate record is not processed.

User Response: Remove the duplicate record from the configuration file.

BFSxx1012E Could not obtain storage for virtual storage pool *VSPOOLn*

Explanation: The storage needed for the specified file server host program virtual storage pool was not available.

Source: LAN Server

System Action: LAN Server stops.

User Response: Restart LAN Server. If the problem persists, adjust the VSPOOLn size or increase the region size of the file server host program.

BFSxx1015E The sum of the VSPOOL1 and VSPOOL2 values exceeds the region size minus 7 megabytes.

Explanation: The sum of the VSPOOL1 and VSPOOL2 values must be less than or equal to the size of the region size minus 7 megabytes.

Source: LAN Server

System Action: The VSPOOL1 and VSPOOL2 records are not processed. Processing continues.

User Response: Adjust the VSPOOL1 and VSPOOL2 record values or increase the region size of the file server host program.

BFSxx1016E Error on FEP command. front-end processor '*fepname*' is active and cannot be deleted. The FEP command is not processed.

Explanation: The front-end processor specified on the FEP command is active.

Source: LAN Server

System Action: The FEP command is not processed.

User Response: Enter the FEP command after disconnecting the front-end processor.

BFSxx1017E Connection from unauthorized front-end processor *fepname* not allowed. or **Connection from unauthorized administrator *userid* not allowed.**

Explanation: An attempt was made to connect either a:

- front-end processor that was not specified on a FEP record in the OS2LFS configuration file or created with the FEP command, or
- a file server administrator that was not specified on an AUTHORIZ record in the CONFIG configuration file or on an AUTHORIZ command.

Source: LAN Server

System Action: Connection to LAN Server is not allowed.

User Response:

- For front-end processor connections, use the QUERY FEP command to determine the current front-end processor definitions. To define a new front-end processor to LAN Server, an authorized administrator can enter the FEP command. To permanently define the front-end processor, add the appropriate FEP record to the OS2LFS configuration file.
- For administrator connections, use the QUERY AUTHORIZ command to determine the current list of authorized administrators. To define a new administrator to LAN Server, an authorized administrator can enter the AUTHORIZ command. To permanently define the administrator, add the appropriate AUTHORIZ record to the CONFIG configuration file.

Note: A change to the configuration file will not take effect until the next time the file server host program is started.

BFSxx1018E All *nnnn* User Blocks already in use.

Explanation: The number of users specified on the MAXUSERS record in the CONFIG configuration file has been reached. No more OS/2 LAN users can connect to the file server host program until other users disconnect from their file server resources.

Source: LAN Server

System Action: All requests from new OS/2 LAN requesters and front-end processors to connect to the file server host program are denied as long as all user blocks are in use. When currently connected users disconnect from their resources, new users will be allowed to connect.

User Response: To allow more users to connect, shut down LAN Server, increase the value of the MAXUSERS record in the CONFIG configuration file, and restart LAN Server.

BFSxx1019E Storage allocation for *nnnnn* bytes failed in *rtnname*, line *nnnn*.

Explanation: The specified storage allocation request could not be satisfied by the file server host program buffer manager.

Source: LAN Server

System Action: The requested service is unsuccessful. If appropriate, the problem is reflected to the front-end processor, and processing continues.

User Response: If the problem persists, shut down LAN Server, increase the value of the VSPOOL2 record in the CONFIG configuration file. Restart LAN Server.

BFSxx1020I Deallocation of APPC/VTAM conversation *convid* **occurred from FEP** *fepname***.** or **Deallocation of APPC/VTAM conversation** *convid* **occurred from Administrator** *lfsadmid***.**

Explanation: The communication task servicing the specified APPC/VTAM conversation was notified that the conversation to its communication partner was deallocated. These messages normally appear when a front-end processor or administrator requests to be disconnected from the file server host program.

Source: LAN Server

System Action: Both communication tasks serving the specified partner stop.

User Response: None.

BFSxx1024E No administration services are available from the file server host program. or **No NFS file services are available from the file server host program.** or **No OS/2 LAN file services are available from the file server host program.**

Explanation: The specified feature of the file server host program cannot be initialized and therefore is unavailable. This message is normally accompanied by another message describing the reason why the feature cannot be started.

Source: LAN Server

System Action: LAN Server continues to run, but without the specified services.

User Response: If the missing services are required, correct the problem reported by the accompanying message, shut LAN Server down, and then restart it.

BFSxx1030E Error on TRACE OLSUSER command. *value* **is an incorrect parameter or option.** or **Error on QUERY TRACE command.** *value* **is an incorrect parameter or option.** or **Error on TRACE NFSUSER command.** *value* **is an incorrect parameter or option.**

Explanation: The specified value is not a valid parameter or option.

Source: LAN Server

System Action: The command is ignored.

User Response: Enter a correct command.

BFSxx1031I No valid SHARE record(s) were found for FEP *fepname***. Processing continues. The SHARE command defines resources for this front-end processor.**

Explanation: No SHARE record(s) were found for this front-end processor. Resources will be available to the front-end processor if SHARE(s) were defined in a FEP GLOBAL record in the OS2LFS Configuration File, or through the use of the SHARE command.

Source: LAN Server

System Action: None.

User Response: If additional resources are required for this front-end processor, modify the OS2LFS configuration file, or use the SHARE command.

BFSxx1032W No valid FEP record(s) were found in the *config_file* **file. Processing continues. The FEP command can be used to define front-end processors.**

Explanation: No valid FEP records were found in the *config_file* file.

Source: LAN Server

System Action: Processing continues.

User Response: Modify the *config_file* file to contain at least one valid FEP record, or use the FEP command to define front-end processors.

BFSxx1034E Error in file *filename***, line number** *number***.** *account value* **specifies an invalid number of user requests. Processing continues using the default number of requests '***number***'.**

Explanation: The ACCOUNT record specified an invalid number of user requests.

Source: LAN Server

System Action: Processing continues using the default number of requests.

User Response: Correct the ACCOUNT record in the CONFIG configuration file before the next invocation of LAN Server. To change the accounting interval without shutting down the file server host program, use the ACCOUNT command.

BFSxx1035E Error on ACCOUNT command. *value* **specifies an invalid number of user requests. Processing continues using the default number of requests '***number***'.** or **Error on OLS ACCOUNT command. An invalid number of user requests specified:** *value***.** or **Error on NFS ACCOUNT command. An invalid number of user requests specified:** *value***.**

Explanation: The ACCOUNT command specified an invalid number of user requests.

Source: LAN Server

System Action: Processing continues using the default number of requests.

User Response: Reenter the ACCOUNT command with a valid number.

BFSxx1036E Error on ACCOUNT command. ON or OFF was not specified. Accounting information from a previous ACCOUNT command, or from the *file* **file is unchanged.**

Explanation: The ACCOUNT command must specify either ON or OFF.

Source: LAN Server

System Action: The ACCOUNT command is not processed.

User Response: Enter a correct ACCOUNT command.

BFSxx1039W Connection from front-end processor did not succeed. front-end processor *fepname* **is not defined to the file server host program.**

Explanation: A front-end processor tried to connect to LAN Server, but the front-end processor was not known.

Source: LAN Server

System Action: The connection is not completed.

User Response: Verify that the front-end processor is specified

correctly in the OS2LFS configuration file. Enter the FEP CREATE command to dynamically add the front-end processor.

BFSxx1040E Sharing of resource *name* **for front-end processor** *fepname* **did not complete. Insufficient storage in the file server host program.** or **Sharing of resource** *name* **for front-end processor** *fepname* **did not complete. Invalid internal storage.** or **Sharing of resource** *name* **for front-end processor** *fepname* **did not complete. front-end processor could not be notified.** or **Sharing of resource** *name* **for front-end processor** *fepname* **did not complete. The number of SHARE records that have been defined exceeds the MAXSHARES specification or insufficient memory on the front-end processor.** or **Sharing of resource** *name* **for front-end processor** *fepname* **did not complete. Duplicate resource name on front-end processor.** or **Sharing of resource** *name* **for front-end processor** *fepname* **did not complete. Unknown front-end processor error code** *code***.** or **Sharing of resource** *name* **for front-end processor** *fepname* **did not complete. The resource is a meta resource but the front-end processor is not at a level which supports meta resources.**

Explanation: The attempt to notify the front-end processor about a shared resource was unsuccessful for one of the following reasons:

Reason: Insufficient storage in the file server host program.

Explanation: The file server host program did not have enough storage available to complete the resource SHARE processing.

Source: LAN Server

System Action: The front-end processor is not notified about the shared resource.

User Response: If the message is the result of a SHARE ADD command, try the command again. It may complete when the file server host program is not so busy. If the message is the result of the front-end processor attempting to connect to the file server, try to connect again. It may complete when the file server is not so busy. Increase the region size of the file server host program.

Reason: Invalid internal storage.

Explanation: Some file server host program control blocks that are needed for resource sharing are damaged.

Source: LAN Server

System Action: The front-end processor is not notified about the shared resource; however, other services may function properly.

User Response: If the message is the result of a SHARE ADD command, try the command again. LAN Server might have successfully recovered its control blocks. If the message is the result of the front-end processor attempting to connect to the file server host program, try to connect again. If LAN Server system tracing is active, a trace record will be written to the file server host program trace file.

Reason: front-end processor could not be notified.

Explanation: The host could not notify the front-end processor about the shared resource.

Source: LAN Server

System Action: The front-end processor is not notified about the shared resource; however, other services may function properly.

User Response: If the message is the result of a SHARE ADD command, try the command again. If the message is the result of a front-end processor attempting to connect to the file server, try to connect again. If LAN Server system tracing is active, a trace record will be written to the file server host program trace file.

Reason: The number of SHARE records that have been defined exceeds the MAXSHARES specification or insufficient memory on the front-end processor.

Explanation: Either the MAXSHARES value is not large enough, or the front-end processor did not have enough memory available to complete the resource SHARE processing.

Source: LAN Server

System Action: The front-end processor has not added the shared resource. The resource definition has been added to the file server host program.

User Response: Increase the MAXSHARES value in the IBMLAN.INI file of the front-end processor. If the message is the result of a SHARE ADD command, enter the SHARE DELETE command to remove the file server definition and try the command again. If the message is the result of the front-end processor attempting to connect to the file server host program, try to connect again. It may complete when the file server host program is not so busy. If the connect is still unsuccessful, increase the memory on the front-end processor and try to connect again.

Reason: Duplicate resource name on front-end processor.

Explanation: The shared resource definition did not exist on the host but did exist on the front-end processor.

Source: LAN Server

System Action: The resource definition has been added to the file server; however, the definition of the resource may not match the front-end processor definition.

User Response: Check the definitions on both the file server and the front-end processor. If they do not match, enter the SHARE DELETE command to remove the definitions and try the SHARE ADD command. It is possible that someone has added resources through the LAN and not through the file server host program administrator.

Reason: Unknown front-end processor error code *code*

Explanation: The front-end processor has returned an unknown error code.

Source: LAN Server

System Action: The resource definition has been added to the file server; however, the definition on the front-end processor has probably not been added. Other services may function properly.

User Response: If the message is the result of a SHARE ADD command, enter the SHARE DELETE command to remove the definition and try the command again. If host system tracing is active, a trace record will be written to the file server host program trace file. This will be helpful to support personnel.

Reason: The resource is a meta resource but the front-end processor is not at a level which supports meta resources.

Explanation: The file server host program support on the front-end processor is not at a level that supports meta resources.

Source: LAN Server

System Action: The file server host program has not sent the resource definition to the front-end processor.

User Response: If the meta resource should be sent to the front-end processor, then the file serving support on the front-end processor should be upgraded to match the file server host program support.

If the LAN Server support on the front-end processor is at the correct level that supports meta resources, also ensure the LAN Server Ultimedia Resource Reservation System (RRS) has been started and

is operational. Start the LAN Server Ultimedia RRS product on the front-end processor before starting the file server host program.

BFSxx1041E Error on SHARE command. front-end processor '*fepname*' is not defined to the file server host program. The SHARE command is not processed.

Explanation: The front-end processor specified on the SHARE command is not defined to the file server host program.

Source: LAN Server

System Action: The SHARE command is not processed.

User Response: Reenter the SHARE command with the correct front-end processor name.

BFSxx1042E Error on SHARE command. Network name '*name*' is not defined as a shared resource for front-end processor '*fepname*'. The SHARE command is not processed. or **Error on SHARE command. Network name '*name*' is not defined as a shared resource for any front-end processor. The SHARE command is not processed.**

Explanation: The network name specified on the SHARE command is not defined to the front-end processor indicated in the message. If * was specified as the front-end processor name on the SHARE command, the network name is not defined to any front-end processor.

Source: LAN Server

System Action: The SHARE command is not processed.

User Response: Enter a correct SHARE command.

BFSxx1043E Error in file *file*, line number *number*. *Type* name '*name*' specifies no name, an invalid name, or the name is greater than *number* characters. This record is not processed. or **Error in file *file*, line number *number*. *Type* name '*name*' specifies no name, an invalid name, or the name is greater than *number* characters. This record is not processed.** or **Error in file *file*, line number *number*. Resource name '*name*' specifies no name, an invalid name, or the name is greater than *number* characters. This record is not processed.** or **Error in file *file*, line number *number*. Resource name '*name*' specifies no name, an invalid name, or the name is greater than *number* characters. This record is not processed.**

Explanation: A record in the configuration file specified an invalid name, or no name.

Source: LAN Server

System Action: Processing continues. The record(s) in error are not processed.

User Response: Correct the record(s) in the file in error.

BFSxx1044E *name* connected to *resid* resource but uses an incompatible protocol; connection severed.

Explanation: A front-end processor or administrator is connected to the specified file server VTAM APPLID, but the protocol is not recognized.

Source: LAN Server

System Action: The connection is severed. The file server host program continues.

User Response: Attempt to reconnect the front-end processor or administrator, but ensure that the connection is made to the correct VTAM APPLID.

BFSxx1045W Error in file *file*, line number *number*. Expected keyword is REMARK, however *string* was specified. The keyword is not processed. or **Error in file *file*, line number *number*. Expected keyword is PASSWORD, however *string* was specified. The keyword is not processed.**

Explanation: An unexpected keyword was encountered in the file.

Source: LAN Server

System Action: Processing continues. The invalid keyword is not processed.

User Response: Correct the record in the file in error.

BFSxx1046E Error on FEP command. *fepname* specifies an invalid FEP name. The FEP command is not processed.

Explanation: The front-end processor specified on the FEP command is a reserved name and cannot be created or deleted.

Source: LAN Server

System Action: The FEP command is not processed.

User Response: Enter a correct FEP command.

BFSxx1047W Error in configuration file, line number *number*. Remark text is greater than *number* characters. Processing continues. The remark text is truncated to *number* characters.

Explanation: The remark text is too long.

Source: LAN Server

System Action: Processing continues. The remark text is truncated.

User Response: Shorten the remark text to 128 characters or less.

BFSxx1048W Error on SHARE command. Remark text is greater than *number* characters. The SHARE command is processed, the remark text is truncated to *number* characters.

Explanation: The remark text is too long.

Source: LAN Server

System Action: Processing continues. The remark text is truncated.

User Response: None.

BFSxx1049E Error in file *file*, line number *number*. No information was found for '*dsname*'. This record is not processed.

Explanation: Information for the specified data set name was not found.

Source: LAN Server

System Action: Processing continues. This record is not processed.

User Response: Ensure that an LFSDSN record exists for the data set name in the CONFIG configuration file.

BFSxx1050E Error on *command* command. No information was found for '*dsname*'. The command is not processed.

Explanation: Information for the specified data set name was not found.

Source: LAN Server

System Action: The command is not processed.

User Response: Enter a command to define the data set name.

BFSxx1051E Network name *name* already exists for front-end processor *fepname*. The network name is not added to front-end processor *fepname*. or **Export name *exportname* already exists. The export name is not defined.**

Explanation: An attempt was made to define either a new export name that already exists or a new network name that already exists for the specified front-end processor.

Source: LAN Server

System Action: The name is not defined.

User Response: For a network name, either correct the SHARE record in the OS2LFS configuration file, or enter a correct SHARE command. For an export name, correct the export record in the EXPORTS configuration file and enter a correct EXPORTS MODIFY command.

BFSxx1052W Error in the file *file* line number *number*. Incorrect data set name in the resource name *name*. This record is not processed. or **Error in the file *file* line number *number*. Incorrect segment in the resource name *name*. This record is not processed.** or **Error in the file *file* line number *number*. *delimiter* is missing in resource name *name*. This record is not processed.**

Explanation: The resource name contains a syntax error.

Source: LAN Server

System Action: Processing continues. The record is not processed.

User Response: Correct the resource name, either in the OS2LFS configuration file or in the EXPORTS configuration file.

BFSxx1054E The maximum value of the CACHEPG record is invalid.

Explanation: The maximum value of the CACHEPG record exceeds the VSPOOL1 value minus 2 megabytes.

Source: LAN Server

System Action: The CACHEPG record is not processed and the default values are used.

User Response: If the default values are not satisfactory for the environment of the installation, shut down LAN Server, correct the CACHEPG record, and restart LAN Server. Otherwise, ensure that the CACHEPG record is corrected or removed before starting LAN Server the next time.

BFSxx1055E The minimum value of the CACHEPG record is invalid.

Explanation: The minimum value of the CACHEPG record either exceeds the maximum value or it is less than zero.

Source: LAN Server

System Action: The CACHEPG record is not processed and the default values are used.

User Response: If the default values are not satisfactory for the environment of the installation, shut down LAN Server, correct the CACHEPG record in the CONFIG configuration file, and restart LAN Server.

BFSxx1056E Insufficient storage to create group *groupid*.

Explanation: The file server host program does not have enough virtual storage to create group *groupid*.

Source: LAN Server

System Action: If this error message is displayed while processing the Access Control File during LAN Server initialization, then processing of the Access Control File ends and LAN Server ends.

If this error message is displayed in response to the OLSACCS CREATE GROUP command, the group *groupid* is not created and processing of the command ends.

User Response: If the virtual storage error occurred during LAN Server initialization, contact the file server host program administrator to increase the region size or adjust the storage configuration parameters in the CONFIG configuration file.

If the error occurred during processing of the OLSACCS administration command, the virtual storage problem may be a transient condition resulting from a heavily loaded LAN Server. Enter the OLSACCS command at a later time and see if the storage problem has been resolved. If the problem persists, increase the file server host program region size.

BFSxx1057E Insufficient storage to add user *userid.fepname* to group *groupid*.

Explanation: The file server host program does not have enough virtual storage to add user *userid.fepname* to group *groupid*.

Source: LAN Server

System Action: If this error message is displayed while processing the Access Control File during LAN Server initialization, then processing of the Access Control File ends and LAN Server stops.

If this error message is displayed in response to the OLSACCS MODIFY GROUP command, then LAN Server will finish processing the command. That is, OLSACCS MODIFY GROUP allows a LAN Server administrator to specify multiple *userid.fepname* parameters on a single command. If multiple parameters were specified, the file server host program continues processing any remaining parameters, even if this message was displayed for one or more of the parameters. After all of the parameters have been processed, processing of the command ends.

User Response: If the virtual storage error occurred during LAN Server initialization, increase the region size or adjust the storage configuration parameters for the file server host program.

If the error occurred during processing of the OLSACCS command, the virtual storage problem may be a transient condition resulting from a heavily loaded LAN Server. Enter the OLSACCS command at a later time and see if the storage problem has been resolved. If the problem persists, increase the region size or adjust the storage configuration parameters in the CONFIG configuration file for the file server host program.

BFSxx1058E Insufficient storage to update access authority for user *userid.fepname*. or **Insufficient storage to update access authority for group *groupid*.**

Explanation: The file server host program does not have enough virtual storage to update the access authority for the specified user or group.

Source: LAN Server

System Action: If this error message is displayed while processing the Access Control File during LAN Server initialization, then processing of the Access Control File ends and LAN Server ends.

If this error message is displayed in response to the OLSACCS GRANT AUTHORITY or OLSACCS REVOKE AUTHORITY commands, then the file server host program finishes processing the command. That is, OLSACCS GRANT AUTHORITY and OLSACCS REVOKE AUTHORITY allow a file server host program administrator to specify multiple *userid.fepname* and *groupid* parameters on a single command. If multiple parameters were specified, the file server continues processing any remaining parameters, even if this message was displayed for one or more of the parameters. After all of the parameters have been processed, processing of the command ends.

User Response: If the virtual storage error occurred during LAN Server initialization, increase the region size or adjust the storage configuration parameters for the file server host program.

If the error occurred during processing of the OLSACCS command, the virtual storage problem may be a transient condition resulting from a heavily loaded file server host program. Reenter the OLSACCS command at a later time and see if the storage problem has been resolved. If the problem persists, increase the region size or adjust the storage configuration parameters for the file server host program.

BFSxx1059E Insufficient storage to create access authority for resource *name*. or **Insufficient storage to create access authority for resource *name*...**

Explanation: While processing the Access Control File during initialization, the file server host program does not have enough virtual storage to create the access authority for the specified resource.

If the resource *name* is 40 characters long or less, then the entire resource *name* is displayed in the error message; otherwise, only the first 37 characters of the resource *name* are displayed, followed by an ellipsis (...).

Source: LAN Server

System Action: Processing of the Access Control File ends and LAN Server stops.

User Response: Increase the region size or adjust the storage configuration parameters in the CONFIG configuration file for the file server host program.

BFSxx1060I Authority not revoked. No profiles found for this resource. or
Purge processing started. or **Purge processing complete.**

Explanation: For the first message, no authority has been revoked via the ACCESS command as no profiles were found for the target file or directory.

For the second and third messages, LAN Server has started or completed purge processing for the ACCESS REVOKE command.

Source: LAN Server

System Action: Issue the QUERY ACCESS command to display the access control profiles for the directory or file.

User Response: None.

BFSxx1061I The Access Control File *dsname* was not found. The file server host program is continuing with no access authority defined.

Explanation: The file server host program access control data set cannot be found during file server initialization. The access controls are not initialized.

Source: LAN Server

System Action: The file server host program continues the initialization process. No users will have authority to access file server resources.

User Response: Use an access control file to define the controls for end users accessing file server resources. To define controls for starting the file server, an administrator can use the OLSACCS command.

If a Access Control File is found, stop the file server host program. Verify that the file exists as a sequential data set as specified on the ACCSCTL DD statement. Ensure that the file server host program has read/write authority to the data set. Correct the problem. Restart the file server host program.

BFSxx1062E Error processing LAN Server Access Control File *dsname*.

Explanation: LAN Server detected an error during initialization while processing the access control data set.

Source: LAN Server

System Action: Processing of the Access Control data set ends and LAN Server stops.

User Response: Examine the JCL to determine the reason for an error in accessing the file server host program Access Control data set. Verify that the file exists as a sequential data set as specified on the ACCSCTL DD statement. Ensure that the file server host program has read/write authority to the data set. Correct the problem and restart LAN Server.

BFSxx1063E Error processing LAN Server Access Control File *dsname*.

Explanation: LAN Server has encountered an error accessing the access control data set while processing an OLSACCS command.

Source: LAN Server

System Action: The change caused by the OLSACCS command will remain in effect only for this invocation of LAN Server. The temporary access control data set has been updated, but the permanent access control file has not.

User Response: Examine the JCL to determine the reason for an error in accessing the permanent file server access control data set. Ensure the file server host program has read/write authority to the data set. Correct the problem and reenter the command. Otherwise, use the temporary access control data set to rebuild the permanent access control data set. Correct the problem and restart LAN Server.

BFSxx1064E Invalid record found in LAN Server Access Control File *dsname*, **line number** *nnn*.

Explanation: This message is issued during initialization to signal an error that was found in the LAN Server Access Control File.

Although the file is written in a human-readable format to provide a log of the group and resource access authority definitions for the file server, it should not be manually edited since the file server host program expects the file to be in a special format. If errors are introduced in the file because of manual editing, the results are unpredictable and may actually cause the file server host program to stop during initialization or define the wrong authorization controls.

A LAN Server administrator should use the OLSACCS administration command to change the group and resource access authority definitions.

Source: LAN Server

System Action: Processing of the Access Control File ends and LAN Server stops.

User Response: Restore the corrupted LAN Server Access Control File from a valid backup copy and restart LAN Server. If there is no backup copy, then delete the corrupted Access Control File, allocate a new one, and restart LAN Server. The LAN Server administrator must use the OLSACCS command to redefine the access authorities for the file server host program.

BFSxx1065E Error processing temporary file *tempds* **to hold access control updates. The permanent access control file** *accsctlds* **has not been changed.**

Explanation: The file server host program writes access control changes to a temporary file prior to updating the permanent access control file. An error occurred while opening or writing to the temporary file to reflect the results of an OLSACCS command. The permanent access control file has not been changed.

Source: LAN Server

System Action: The result of the OLSACCS command will be in effect only for the current invocation of the file server. When the file server host program is stopped, the results of the command will be lost.

User Response: Determine why the file server host program was unable to update the Access Control File. Ensure that the file server host program has the proper security access to allocate and update a temporary data set. Then reenter the command to cause all updates in memory to be written to the permanent Access Control File.

BFSxx1066I Group *groupid* **has been created.**

Explanation: LAN Server has successfully created the *groupid* specified on the OLSACCS command.

Source: LAN Server

System Action: Processing of the command is complete.

User Response: None. The LAN Server administrator may now enter OLSACCS commands to add users to the *groupid* or define the access authority for the *groupid*.

BFSxx1067I Group *groupid* **has been deleted.**

Explanation: LAN Server has successfully deleted the *groupid* specified on the OLSACCS command. As a result, all access authorities that were in effect for group *groupid* were revoked.

Source: LAN Server

System Action: Processing of the command is complete.

User Response: None.

BFSxx1068E User *userid.fepname* **is not in group** *groupid*.

Explanation: LAN Server was unable to remove the user(s) specified on the OLSACCS command (*userid.fepname*) from group *groupid* because they are not in the group.

Source: LAN Server

System Action: OLSACCS MODIFY GROUP allows a LAN Server administrator to specify multiple *userid.fepname* parameters on a single command. If multiple parameters were specified, the file server host program continues processing any remaining parameters, even if this message was displayed for one or more of the parameters. After all of the parameters have been processed, processing of the command ends.

User Response: Check to ensure the *userid.fepname* and *groupid* parameters were correct. If they were specified correctly, then no action is required; otherwise reenter the OLSACCS command with the correct parameters.

BFSxx1069E Group *groupid* **already exists.**

Explanation: LAN Server was unable to create the *groupid* specified on the OLSACCS command because the group already exists.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Enter the QUERY OLSGROUP command to determine which groups already exist. To create a new group, enter the OLSACCS command and specify a *groupid* that does not already exist.

BFSxx1070E Group *groupid* **is not empty and has not been deleted.**

Explanation: LAN Server server was unable to delete the *groupid* specified on the OLSACCS command because the group still contains one or more users.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Check the *groupid* to ensure the group was specified correctly and, if not, enter the OLSACCS command with the correct *groupid*. If the *groupid* was specified correctly, then all users must be removed from the *groupid* by using the OLSACCS MODIFY command before the group can be deleted.

BFSxx1071I User *userid.fepname* **is now in group** *groupid*.

Explanation: LAN Server has successfully added the user specified on the OLSACCS command (*userid.fepname*) to group *groupid* or the user was already in group *groupid*.

Source: LAN Server

System Action: OLSACCS MODIFY GROUP allows a LAN Server administrator to specify multiple *userid.fepname* parameters on a single command. If multiple parameters were specified, the file server host program continues processing any remaining parameters, and this message will be displayed once for every parameter

that is successfully processed. After all of the parameters have been processed, processing of the command ends.

User Response: None.

BFSxx1072I User *userid.fepname* **has been removed from group** *groupid***.**

Explanation: LAN Server has successfully removed the user(s) specified on the OLSACCS command (*userid.fepname*) from group *groupid*.

Source: LAN Server

System Action: OLSACCS MODIFY GROUP allows a LAN Server administrator to specify multiple *userid.fepname* parameters on a single command. If multiple parameters were specified, the file server host program continues processing any remaining parameters, and this message will be displayed once for every parameter that is successfully processed. After all of the parameters have been processed, processing of the command ends.

User Response: None.

BFSxx1073I Access authority has been updated for user *userid.fepname***.** or **Access authority has been updated for group** *groupid***.** or **Access authority has been granted for user** *userid.fepname rights***.** or **Access authority has been granted for group** *groupid rights***.** or **Access authority has been revoked for user** *userid.fepname rights***.** or **Access authority has been revoked for group** *groupid rights***.** or **Trying to revoke** *rights* **user** *userid..fepname* **does not have.** or **Trying to revoke** *rights* **group** *groupid* **does not have.**

Explanation: For the first six messages, LAN Server has successfully updated the access authority for user *userid.fepname* or group *groupid* specified on the OLSACCS or ACCESS command.

For the last two messages, the administrator is trying to revoke *rights* the user *userid.fepname* or group *groupid* does not have.

Source: LAN Server

System Action: OLSACCS GRANT AUTHORITY and OLSACCS REVOKE AUTHORITY allow a LAN Server administrator to specify multiple *userid.fepname* and *groupid* parameters on a single command for base or undefined datasets.

ACCESS GRANT and ACCESS REVOKE allow a LAN Server administrator to specify multiple *userid.fepname* and *groupid* parameters on a single command for extended formatted datasets.

If multiple parameters were specified, the file server host program continues processing any remaining parameters, and this message will be displayed once for every parameter that is successfully processed. After all of the parameters have been processed, processing of the command ends.

User Response: Issue the QUERY OLSAUTH or QUERY ACCESS command to determine what *rights* the user or group does have.

BFSxx1074E The <PUBLIC> group cannot be modified or deleted.

Explanation: The PUBLIC group is a special group that always exists and contains all LAN users. Consequently, the OLSACCS command cannot be used to add or remove users from the special PUBLIC group or to delete the PUBLIC group.

Source: LAN Server

System Action: Processing of the command ends.

User Response: None.

BFSxx1075E User(s) *userid.fepname* **not found.** or **Group** *groupid* **not found.** or **Resource(s)** *name* **not found.** or **Resource(s)** *name***... not found.**

Explanation: The user(s), group, or resource(s) specified on the QUERY command are not known to the file server host program.

For QUERY OLSUSER this means that there are no users matching *userid.fepname* that belong to any groups or that have been granted specific access (by their *userid.fepname*) to any resources at the file server host program.

For QUERY OLSGROUP this means that group *groupid* has not been created and therefore does not exist at the host file server.

For QUERY OLSAUTH this means that the resource specified (*name*) does not have any explicit access authority defined at the host file server and therefore is classified as an unrestricted resource. Any access authority that has been defined at the file server host program for the special resource UNRESTRICTED_RESOURCES is in effect for the resource specified (*name*). If the resource name is 40 characters long or less, then the entire resource name is displayed in the error message; otherwise, only the first 37 characters of the resource name are displayed, followed by an ellipsis (...).

Source: LAN Server

System Action: Processing of the command ends.

User Response: Check to ensure the *userid.fepname*, *groupid* or resource *name* parameter was typed correctly. If it was specified correctly, then no action is required; otherwise reenter the QUERY command with the correct parameter.

BFSxx1076E No access authority to the specified resource is defined for user *userid.fepname***.** or **No access authority to the specified resource is defined for group** *groupid***.**

Explanation: LAN Server was unable to perform the OLSACCS REVOKE AUTHORITY command because no access authority to the specified resource is in effect for the *userid.fepname* or *groupid*.

Source: LAN Server

System Action: OLSACCS REVOKE AUTHORITY allows a LAN Server administrator to specify multiple *userid.fepname* and *groupid* parameters on a single command. If multiple parameters were specified, the file server host program continues processing any remaining parameters, even if this message was displayed for one or more of the parameters. After all of the parameters have been processed, processing of the command ends.

User Response: Check to ensure the *userid.fepname* or *groupid* parameter are correct. If they were specified correctly, then no action is required; otherwise reenter the OLSACCS command with the correct parameter.

BFSxx1077E Updating the access authority for group <ADMINISTRATORS> is not permitted.

Explanation: The ADMIN group is a special group that, when created, has read/write access authority to all LAN Server resources. Consequently the OLSACCS command cannot be used to update the access authority for the special ADMIN group.

Source: LAN Server

System Action: Processing of the command ends.

User Response: None.

BFSxx1078I LAN Server shutdown in progress; waiting for active work to complete...

Explanation: LAN Server is waiting for all work-in-progress to be completed before shutting down. This message may appear multiple times and is only intended to inform the LAN Server operator of shutdown progress.

Source: LAN Server

System Action: LAN Server shutdown processing continues.

User Response: None.

BFSxx1079E Deletion of shared resource *name* for front-end processor *fepname* did not complete. Insufficient storage in the file server host program. or **Deletion of shared resource *name* for front-end processor *fepname* did not complete. Invalid internal storage.** or **Deletion of shared resource *name* for front-end processor *fepname* did not complete. front-end processor could not be notified.** or **Deletion of shared resource *name* for front-end processor *fepname* did not complete. A SHARE ADD resource command is still in progress.**

Explanation: A SHARE DELETE was unsuccessful for one of the following reasons:

Reason: Insufficient memory in the file server host program.

Explanation: The file server host program did not have enough storage available to complete the SHARE DELETE command.

Source: LAN Server

System Action: The shared resource is not deleted.

User Response: Try the SHARE command again, it may complete when LAN Server is not as busy. Increase the region size of the file server host program.

Reason: Invalid internal storage.

Explanation: Some LAN Server control blocks are damaged.

Source: LAN Server

System Action: The shared resource is not deleted, however; other services may function properly.

User Response: Do not enter the SHARE command again for this resource. If LAN Server system tracing is active, a trace record will be written to the file server host program trace file.

Reason: front-end processor could not be notified.

Explanation: The host could not notify the front-end processor.

Source: LAN Server

System Action: The shared resource is not deleted, however other services may function properly.

User Response: Try the SHARE command again. If LAN Server system tracing is active, a trace record will be written to the file server host program trace file.

Reason: A SHARE ADD resource command is still in progress.

Explanation: A previous SHARE ADD command for this resource has not completed.

Source: LAN Server

System Action: The shared resource is not deleted, however other services may function properly.

User Response: Try the SHARE command again. If LAN Server system tracing is active, a trace record will be written to the file server host program trace file.

BFSxx1080W Resource *name* does not exist on front-end processor *fepname*. The resource may have been deleted from the front-end processor. The resource has been deleted from the file server host program.

Explanation: The SHARE DELETE command was entered. The resource definition existed on the file server host program but did not exist on the front-end processor.

Source: LAN Server

System Action: The resource definition has been deleted from the file server host program.

User Response: It is possible that the resource was deleted through the LAN and not through the LAN Server administrator. Verify if this is the case.

BFSxx1081E *value* specifies an invalid parameter or option.

Explanation: An invalid parameter or option was entered on the QUERY FEP command.

Source: LAN Server

System Action: The QUERY FEP command is not processed.

User Response: Correct and reenter the QUERY FEP command.

BFSxx1082I The existing LFSDSN entry for this data set has been updated.

Explanation: The LFSDSN command completed successfully by modifying the information that already existed for the specified data set.

Source: LAN Server

System Action: The LFSDSN information is updated with the new values.

User Response: None.

BFSxx1083E Error on FEP command. front-end processor '*fepname*' is not defined to the file server host program. The FEP command is not processed.

Explanation: The front-end processor specified on the FEP command is not defined to the file server host program.

Source: LAN Server

System Action: The FEP command is ignored.

User Response: Correct and reenter the FEP command.

BFSxx1084E Error on FEP command. front-end processor '*fepname*' already exists. The FEP command is not processed.

Explanation: The front-end processor specified on the FEP command already exists.

Source: LAN Server

System Action: The FEP command is not processed.

User Response: Enter a correct FEP command.

BFSxx1085E Error accessing the data set *dsname*

Explanation: While processing a command or configuration record, the file server host program detected an error allocating the Linear Data Set (LDS) *dsname*.

Source: LAN Server

System Action: The LDS will not be available to the file server host program.

User Response: Determine why the LDS could not be allocated and correct the problem. Then enter the administration command again.

BFSxx1086E No LFSDSN information is available for the Linear Data Set.

Explanation: An LDS that is not known to the file server host program was specified on a command. This means that:

- The CONFIG Configuration File contained no LFSDSN record for this data set at the time LAN Server was started, and
- No LFSDSN command has been entered for this data set.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Check the data set parameter of the command to ensure it was correct. If it was not correct, reenter the command with the correct data set parameter; otherwise, use the LFSDSN command to identify the data set to the file server host program and then reenter the command.

If the data set is to be used permanently by the file server host program add an LFSDSN record for this data set to the CONFIG configuration file, so that when the LAN Server is shut down and restarted, the data set is automatically identified.

BFSxx1087E An LDS is already allocated by another task.

Explanation: A data set specified on a command could not be allocated because another task already has an allocation to the data set that conflicts with the allocation that the file server host program or FORMATDS command is trying to obtain.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Determine what task has the conflicting allocation to the data set and have the task release its allocation to the data set or change its allocation to one that is compatible. Then, enter the command again.

BFSxx1088E The Linear Data Set is not recognized by the file server host program.

Explanation: A data set specified on a command could not be accessed because the internal data set format is not recognized by the file server host program.

Source: LAN Server

System Action: Processing of the command ends.

User Response: This error will occur when a new data set is created for the file server host program but was not formatted. All data sets that will be used by the file server host program must be formatted with the FORMATDS command prior to use. When the data set has been properly formatted, reenter the command.

BFSxx1090E An error occurred copying the following source file:

Explanation: While processing a COPY command, an error occurred copying one of the specified files.

Source: LAN Server

System Action: Additional messages will be displayed that show all of the following:

- Full directory path and name of the file that detected the error
- Indication of what kind of error was detected
- Number of files that were successfully copied before the error occurred

Processing of the command ends.

User Response: Use the additional messages to determine the cause of the error and reenter the COPY command when the problem is corrected.

BFSxx1091E *filespec* or *filespec***...**

Explanation: This error message follows message 1090E to show the full path and name of the file being processed when an error occurred on a COPY command.

If the full path and name of the file is not more than 67 characters, then it is shown on a single error message line. Otherwise, it is broken into segments and displayed on multiple lines, and each partial line ends with an ellipsis (...).

Source: LAN Server

System Action: Additional messages are displayed to show the:

- Kind of error detected
- Number of files successfully copied before the error occurred

Command processing ends.

User Response: Use the additional messages to determine the cause of the error. Reenter the COPY command when the problem is corrected.

BFSxx1092E Error releasing data set *dsname*

Explanation: While processing a command, the file server host program detected an error releasing or detaching either the source or target data set, *dsname*.

Source: LAN Server

System Action: An additional error message will be displayed indicating why the data set could not be released or detached.

User Response: Use the additional error message to determine why the data set could not be released or detached. Because the error occurred at the end of command processing, there is probably no need to reenter the command.

BFSxx1093E Insufficient storage in the file server host program to complete the file ADMIN command.

Explanation: The file server host program does not have enough storage to complete the command.

Source: LAN Server

System Action: If copying, an additional message will be displayed indicating how many files were successfully copied before the storage problem occurred. Processing of the command ends.

User Response: A storage problem may be a transient condition resulting from a heavily loaded server. Reenter the command later to check if the storage problem has been resolved. If the problem per-

sists, increase the region size or adjust the storage configuration parameters in the CONFIG configuration file for the file server host program.

BFSxx1094E The required file lock could not be obtained.

Explanation: While processing a COPY or INPUT command, the file server host program was unable to access one of the specified files because the file was locked.

Source: LAN Server

System Action: For COPY, an additional message will be displayed indicating how many files were successfully copied before the file lock error occurred. Processing of the command ends.

User Response: A file locking problem is normally just a transient condition that occurs when two or more users attempt to access a file simultaneously. Reenter the COPY or INPUT command at a later time and see if the file lock problem has been resolved. If the problem persists, determine what user is accessing the file and have the user release the file before reentering the COPY or INPUT command.

BFSxx1095E Data set *dsname* is full.

Explanation: LAN Server was unable to complete the COPY command because there is no more space on the target data set.

Source: LAN Server

System Action: An additional message will be displayed indicating how many files were successfully copied before the data set full error occurred. Processing of the command ends.

User Response: Because the target data set did not have sufficient space to hold all of the files to be copied, it may be necessary to access the full data set from a LAN workstation and delete the files that were successfully copied. The COPY command can then be reentered specifying a different target data set that has enough space to hold all of the files to be copied.

BFSxx1096E The target file already exists; use the REPLACE or APPEND option. or **The target file already exists; use the REPLACE option.** or **The target file already exists.**

Explanation: One of the following has occurred: While processing a COPY command, the file server host program was unable to copy one of the specified files because the target file already exists; or while processing an INPUT command, the file server was unable to create the asset metafile because the target file already exists on the META disk.

Source: LAN Server

System Action: For COPY, an additional message will be displayed indicating how many files were successfully copied before the existing file error occurred. Processing of the command ends.

User Response: For COPY, reenter the COPY command, specifying either the REPLACE or APPEND option to control how the existing target file should be handled. For INPUT, choose a new target name or use REMOVE command to remove the existing asset.

BFSxx1097E The file cannot be copied to itself.

Explanation: The COPY command cannot copy a file to the same data set, directory, and file name as the source file.

Source: LAN Server

System Action: An additional message displays to specify how many files were successfully copied before the error occurred. No other action is taken. Processing of the administration request ends.

User Response: Enter the COPY command again, specifying a different target data set, directory, or file name.

BFSxx1098E File not found.

Explanation: While processing an administrator command, the file server host program was unable to locate the specified files.

Source: LAN Server

System Action: No files were successfully processed. Processing of the command ends.

User Response: Enter the command again, specifying one or more existing files to be processed.

BFSxx1099E Invalid directory path specified or path not found.

Explanation: While processing a command, the file server host program was unable to locate either the source or target directory path, or a source or target directory path that is not valid was specified.

Source: LAN Server

System Action: If it was a COPY command, then an additional message will be displayed indicating that no files were successfully copied. Processing of the command ends.

User Response: Reenter the command, if necessary, with the correct source and target directory paths.

BFSxx1100E The LFSDSN is allocated with a disposition of shared.

Explanation: The file server host program was unable to complete the ADMIN command because the LFSDSN information for the target data set specifies a read/only access mode.

Source: LAN Server

System Action: If copying, an additional message will be displayed indicating that no files were successfully copied. Processing of the command ends.

User Response: Because the target disk can only be allocated read/only, it is not possible for the file server host program to perform the COPY or ACCESS command. Either reenter the command specifying a target data set that can be allocated with write access, or use the LFSDSN command to change the access mode for the target data set before reissuing the command for that data set.

BFSxx1102E Error handling extended attributes for the file or directory.

Explanation: One of the following has occurred: While processing a COPY command, the file server host program was unable to complete the COPY command because an unexpected error occurred handling the extended attributes of a file or directory that was being copied; or while processing an INPUT command, the file server was unable to create the asset metafile because an unexpected error occurred handling the extended attributes of a file or directory.

Source: LAN Server

System Action: For COPY, an additional message will be displayed indicating how many files were successfully copied before the error was detected. Processing of the command ends.

User Response: For COPY, because an error exists in the file or directory extended attributes, that file or directory cannot be copied. Reenter one or more COPY commands, if necessary, to copy any other files or directories while bypassing the problem file or directory. For INPUT, OS/2 user can use QOSEA tool to set.

BFSxx1103E An unexpected file system error occurred.

Explanation: The file server host program was unable to complete the command because of an unexpected file system error.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Verify that the FORMATDS command has been displayed against the data set of interest. If the FORMATDS command was completed, this message probably indicates an internal file server host program error. Use the TRACE SYSTEM command to collect trace data that can be used by system support personnel to diagnose the problem, and then reenter the command when the file system error has been corrected.

BFSxx1104I Please wait...

Explanation: The file server host program has started processing the COPY command. Because the COPY command can be used to copy a large number of files, it may take some time.

Source: LAN Server

System Action: When the COPY command has ended, additional messages will be displayed indicating the results of the COPY command and how many files were copied successfully, and then processing of the COPY command ends.

User Response: Wait for the completion of the COPY command.

BFSxx1105I *nnn* **file(s) copied.**

Explanation: The COPY command has ended and *nnn* files were successfully copied.

Source: LAN Server

System Action: Processing of the command ends.

User Response: None.

BFSxx1106I A command to *action* **netname** *netname* **for front-end processor** *fepname* **has been started.**

Explanation: A command to delete or add a shared resource was started for the front-end processor. All active front-end processors that may access the netname have been notified.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1107I front-end processor *fepname* **was successfully created.** or **front-end processor** *fepname* **was successfully deleted.**

Explanation: The front-end processor was created or deleted.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1108I FEP ALLOWANY was turned on. or **FEP ALLOWANY was turned off.**

Explanation: FEP ALLOWANY was turned on or off.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1110E Internal error: an invalid request buffer was received from FEP *fepname***. LAN Server will stop.**

Explanation: A request buffer received from the specified front-end processor contained damaged length values. Because of this, the file server host program can no longer guarantee the integrity of the commands currently queued in the server or the data on which they will operate.

Source: LAN Server

System Action: A dump of the address space is taken if SYSMDUMP or SYSUDUMP was specified in the startup JCL. LAN Server abnormally ends with abend code 30. Message 0000E will appear after this message.

User Response: After the dump completes, restart LAN Server. If problem persists, start local diagnostic procedures for handling system program problems.

BFSxx1111E Internal error: uid *value***, passed to the file server from FEP** *fepname***, has no associated user block. The FEP will be disconnected from LAN Server.**

Explanation: The specified front-end processor sent an internal uid value that is not valid to LAN Server. Because of this, the file server host program can no longer trust the integrity of the front-end processor.

Source: LAN Server

System Action: All paths to the front-end processor are severed, all files currently open through the front-end processor are closed, and all user blocks and other storage related to the front-end processor are cleaned up.

User Response: Reconnect the front-end processor to the file server host program. If problem persists, start local diagnostic procedures for handling system program problems.

BFSxx1112E Internal error: A non-matching FEP id, *fep_id***, was passed to the file server from FEP** *fepname***. The FEP will be disconnected from LAN Server.**

Explanation: The specified front-end processor sent an internal FEP id that is not valid to LAN Server. Because of this, the file server host program can no longer trust the integrity of the front-end processor.

Source: LAN Server

System Action: All paths to the front-end processor are severed, all files currently open through the front-end processor are closed, and all user blocks and other storage related to the front-end processor are cleaned up.

User Response: Reconnect the front-end processor to the file server host program. If problem persists, start local diagnostic procedures for handling system program problems.

BFSxx1113I No network resource names were found for front-end processor *fepname*. The SHARE command is ignored.

Explanation: The SHARE command requested that all network resource names be deleted for the specified front-end processor. However, no network resource names were found for the specified front-end processor.

Source: LAN Server

System Action: The SHARE command is ignored.

User Response: None.

BFSxx1114I Copying the source file(s) to the target file. or **Copying the source file(s) to the target directory.** or **Copying all files in the source directory to the target file.** or **Copying all files in the source directory to the target directory.** or **Copying the source directory tree to the target directory.** or **Copying the source file(s) to a sequential data set.** or **Copying the source file(s) to a PDS.** or **Copying all the files in the source directory to the sequential data set.** or **Copying all the files in the source directory to the PDS.**

Explanation: The file server host program has compared the operands specified on the COPY administration request to the current contents of the source and target data sets and will perform the copy operation described in the message.

Source: LAN Server

System Action: If no options were specified that conflict with the source and target operands, the file server will begin processing the COPY administration request. Additional messages will display indicating the results of the COPY request and how many files were successfully copied. Then, processing of the administration request ends.

User Response: No action is required.

BFSxx1115E The 'TREE' option requires the source and target to be directories.

Explanation: The TREE option of the COPY command is only valid when both the source and target are directories.

Source: LAN Server

System Action: An additional message will be displayed indicating that no files were successfully copied. Processing of the command ends.

User Response: Reenter the COPY command, if necessary, specifying a valid directory for both the source and target. Note that if the target does not exist, it is assumed to be a directory and will be created during COPY command processing.

BFSxx1116E The target file name contains an invalid character.

Explanation: While processing a COPY command, LAN Server was unable to copy one of the specified files because the target file name contains a character that is not valid.

Source: LAN Server

System Action: An additional message will be displayed indicating how many files were successfully copied before the error occurred. Processing of the command ends.

User Response: Reenter the COPY command for the file containing the invalid character, explicitly specifying a target file name that is valid for the target data set.

BFSxx1117I Mounting data set *dsname*...

Explanation: The data set, *dsname*, is being mounted by the file server host program.

When the file server mounts (allocates and accesses) a data set, it scans the entire data set in order to learn its directory structure. For data sets with a large number of subdirectories, this process may take a while.

Source: LAN Server

System Action: An additional message will be displayed indicating the results of the data set mount operation.

User Response: None.

BFSxx1118I Data set *dsname* has been mounted successfully.

Explanation: The data set, *dsname*, has been mounted by the file server host program.

Source: LAN Server

System Action: The data set will remain mounted until LAN Server is shut down.

User Response: None.

BFSxx1119I Data set *dsname* is already mounted.

Explanation: The data set, *dsname*, specified on the LFSDSN command has already been mounted by the file server host program.

Source: LAN Server

System Action: The data set will remain mounted until LAN Server is shut down.

User Response: None.

BFSxx1120I Data set *dsname* is unmounting. Please wait.

Explanation: The specified data set *dsname* is being unmounted.

Source: LAN Server

System Action: The specified dataset is unmounted.

User Response: None.

BFSxx1121I The LFSDSN entry will be dropped.

Explanation: This message is preceded by another message which describes an error condition that occurred while validating the LFSDSN information against the actual data set.

Source: LAN Server

System Action: The subject LFSDSN entry is deleted from the file server host program storage.

User Response: Correct the error according to the explanation of the message that preceded this one and enter an LFSDSN command to define the data set to the file server.

BFSxx1122E Error on SHARE command. DELete fepname * is not allowed when the netname is defined in the <GLOBAL> front-end processor. The SHARE command is not processed.

Explanation: If * is specified as the front-end processor name on the SHARE command, the netname must not be defined in the <GLOBAL> front-end processor.

Source: LAN Server

System Action: The SHARE command is not processed.

User Response: Enter a correct SHARE command.

BFSxx1124E The *keyword* record of the *dsname* file must be the first record. LAN Server will stop.

Explanation: The specified record must be the first record in the file.

Source: LAN Server

System Action: LAN Server processing stops.

User Response: Correct the record in error and restart LAN Server.

BFSxx1125E The *dsname* cannot be found. LAN Server ends.

Explanation: The specified translation or case table does not exist.

Source: LAN Server

System Action: LAN Server ends.

User Response: Verify that the *dsname* is spelled correctly. If the table does not exist, use the LAN Server distribution tapes to copy the data set to a partitioned data set.

BFSxx1126E EXTERNAL was specified on the SECURITY record in the NFSLFS configuration file, but there is no External Security Manager installed. The NFS feature will not be activated.

Explanation: An External Security Manager was not found but the SECURITY record in the NFSLFS configuration file specifies that there is one.

Source: LAN Server

System Action: The NFS feature will not be activated because SECURITY EXTERNAL cannot be specified when an External Security Manager is not installed. Other file server features will continue to initialize.

User Response: Specify SECURITY LOCAL in the NFSLFS configuration file and restart the file server host program.

BFSxx1131E Errno code *errnoname* (*errnonumber*) received from TCPIP on *socketfunction* function call.

Explanation: An error was returned on the specified socket function call. Both the symbolic and numeric *errno* values from the socket call are displayed. The most common codes are:

EADDRINUSE often appears while LAN Server is being started. It means that some other job currently owns the UDP port specified on the NFS record in the CONFIG configuration file. This port number conflict must be resolved before LAN Server can be started on the host system. Check for other jobs using the same port number.

ENETDOWN indicates that the network is unreachable at the moment. Check for errors on the TCP/IP address space.

ENETUNREACH indicates that the network is unreachable at the moment. If this appears when LAN Server is attempting to register itself with the portmapper, it usually means that the portmapper service is not started. Otherwise, check for any TCP/IP errors.

EIBMIUCV indicates that LAN Server cannot connect to the TCP/IP address space. There may be a problem with TCP/IP. Ensure that TCP/IP is started and working. LAN Server will attempt to reconnect to TCP/IP, but it may need to be restarted.

Source: LAN Server

System Action: Depending on the error, LAN Server NFS file services either continue to be available, or a restart of TCP/IP communications is attempted.

User Response: If the problem is one of those described above, then handle as indicated. Otherwise, invoke local diagnostic procedures using the *errnoname* information. These values are described in *OS/390 SecureWay Communications Server: IP Programmer's Reference*. Also check for any TCP/IP error messages. Note that in most cases, once the problem is corrected, LAN Server will establish TCP/IP communication and NFS file services will become available through the TCP/IP address space.

BFSxx1135E Incorrect or extraneous option *option* specified.

Explanation: An incorrect or extra option was specified on a command or a configuration record.

Source: LAN Server

System Action: The command or record is not processed.

User Response: Correct or remove the option that is not valid and reenter the command or restart the file server host program.

BFSxx1136E The ANY option is not allowed if LAN resource names have already been defined on the root directory of the data set.

Explanation: The ANY option of the SET ATTRIB request cannot be used when resource names are already defined in the root directory.

Source: LAN Server

System Action: None.

User Response: Enter the request again, specifying a different option for this particular data set.

BFSxx1137E Naming option conflicts with existing attributes of the parent directory.

Explanation: The naming option specified on the administration request conflicts with already existing attributes for the dataset.

Source: LAN Server

System Action: None.

User Response: Enter the request again, specifying a naming option that is compatible with the existing attributes of the dataset or parent directory.

BFSxx1138E Error in the file *file*, line number *number*. *name* specifies a password greater than *number* characters.

Explanation: The name contains more characters than the allowed maximum number.

Source: LAN Server

System Action: Processing continues with the next record in the file.

User Response: Correct the record in the file in error.

BFSxx1139E Error in file *filename* **line number** *line_number***.** *record_type* **record attempted to define the root directory of a data set with the ANY naming attribute. Processing continues ignoring this record.**

Explanation: An attempt was made to export a file system which is the root directory of a data set with the ANY attribute.

Source: LAN Server

System Action: The record is not processed. Processing continues.

User Response: Correct the record and issue the EXPORT MODIFY command for the export name.

BFSxx1141E You cannot delete a non-empty directory.

Explanation: The directory you tried to delete is not empty.

Source: LAN Server

System Action: None.

User Response: Empty the directory and then enter the request again.

BFSxx1142E Unable to register with the portmapper (rc = *code***): Retrying...**

Explanation: The file server host program was not able to register itself with the TCP/IP portmapper service. Because of this, the file server cannot establish itself as an NFS file server through the TCP/IP address space.

Source: LAN Server

System Action: The file server host program will continue to attempt to register its UDP port until it succeeds or until a SHUTDOWN command is issued. NFS file services will not be available through the TCP/IP address space until portmapper registration succeeds. When this happens, message 0322I will be presented.

User Response:

- If the problem is related to communications with the portmapper service, message 1131E will appear with a code indicating the error. See the description for message 1131E to determine the problem.
- If message 1131E does not appear, then there may be a contention problem for the UDP port. Use TCP/IP commands such as NETSTAT to determine the status of the UDP port that LAN Server is attempting to register (the port number is specified by the NFS record in the LAN Server CONFIG configuration file). The status information indicates the problem. Once the problem is corrected, the file server host program will be able to register its port.

BFSxx1143E Not valid for a file on the workstation. or **The name is not a directory.**

Explanation: Make sure that the directory is empty or that the file does not exist.

Source: LAN Server

System Action: None

User Response: None

BFSxx1144E Function is not allowed on a data set defined for mixed case.

Explanation: The data set identified on the record or request has been defined as a MIXED data set. If a data set has been defined as MIXED, then a SHARE request is not permitted.

Source: LAN Server

System Action: None

User Response: If the data set was defined as mixed case, it cannot be shared.

BFSxx1145E An error occurred while setting the attributes.

Explanation: The SET ATTRIB request has encountered an error during processing.

Source: LAN Server

System Action: None.

User Response: Check the message that follows this one for more specific error information.

BFSxx1146I Your SET ATTRIB request completed successfully. or **Your VIEWERS request completed successfully.**

Explanation: The administration request completed successfully by setting the attributes of the specified resource.

Source: LAN Server

System Action: The resource's attributes are updated with the new values.

User Response: None.

BFSxx1149E The names parameter may only be specified against the root directory of a workstation format data set.

Explanation: The resource specified on the request was not a root directory.

Source: LAN Server

System Action: None.

User Response: Enter the request again, making sure the resource specified is a root directory. To change the naming attribute of a subdirectory you must delete the current subdirectory, then create a new subdirectory with the desired naming attribute.

BFSxx1150I Export name *exportname* **was successfully added.** or **Export name** *exportname* **was successfully deleted.** or **Export name** *exportname* **was successfully modified.**

Explanation: The file server host program has successfully added, deleted, or modified the export name.

Source: LAN Server

System Action: None.

User Response: No action is required.

BFSxx1151E Export name *exportname* does not exist.

Explanation: The export name specified on the export command does not exist.

Source: LAN Server

System Action: Processing continues. The export command is not processed.

User Response: Verify that the export name is defined in the EXPORTS configuration file and that the case of the export name in the command matches the case of the export name defined in the EXPORTS configuration file.

BFSxx1153E Error on *request* command. You cannot define a *name* for the root directory of a data set with the ANY naming attribute.

Explanation: The command attempted to define the root directory of an ANY format data set, which is not allowed.

Source: LAN Server

System Action: This command is not processed.

User Response: Correct and reenter the command.

BFSxx1154E The specified request cannot be performed to the root of an ANY data set.

Explanation: The COPY request or the RESTORE request attempted to copy a file or files to the root directory of an ANY format data set.

Source: LAN Server

System Action: The request is not processed.

User Response:

- For a COPY request, specify the COPY request again using a valid destination.
- For a RESTORE request, specify the RESTORE request again using a MIXED or FOLD file services data set, or MIXED or FOLD subdirectory of the ANY data set.

BFSxx1161E You cannot change the naming attribute of a non-empty data set or directory.

Explanation: The data set or directory that you tried to change the naming attributes of is not empty.

Source: LAN Server

System Action: None.

User Response: Enter the request again, making sure that data set or directory is empty.

BFSxx1162E The MIXED option is not allowed if netnames have already been defined on the data set.

Explanation: The MIXED option of the SET ATTRIB request cannot be used when netnames are already defined on the data set.

Source: LAN Server

System Action: None.

User Response: Enter the request again, specifying a different option for this particular data set.

BFSxx1164E The number of buffers on the FASTBUFS record is invalid.

Explanation: The first parameter on the FASTBUFS record in the CONFIG configuration file was either not a valid number or was outside the valid range of 0 to 1000.

Source: LAN Server

System Action: The FASTBUFS record is not processed. Default values are used.

User Response: Correct the FASTBUFS record. Shut down then restart LAN Server.

BFSxx1165E The buffer size value on the FASTBUFS record is invalid.

Explanation: The second parameter on the FASTBUFS record in the CONFIG configuration file was either not a valid number or was outside the valid range of 0 to 100.

Source: LAN Server

System Action: The FASTBUFS record is not processed. Default values are used.

User Response: Correct the FASTBUFS record. Shut down and restart LAN Server.

BFSxx1302E CLAW initialization node *fepname* failed, CLAW R/C = *rc*, R15 = *reason*

Explanation: An error has occurred during initialization of the CLAW connection to the named front-end processor.

Source: LAN Server

System Action: The link is ended.

User Response: Verify that the CLAW device addresses specified in the corresponding LINK record are on-line and allocated to the file server host program. If the error persists, record the message text and contact your IBM Service Representative.

BFSxx1303E CLAW internal error code *number* on FEP *fepname*. Binary trace information follows:

Explanation: The CLAW driver for the indicated front-end processor has encountered a programming or system error.

Source: LAN Server

System Action: The CLAW driver for the indicated front-end processor will shut down.

User Response: Note the contents of this message and the accompanying 1304E messages; contact your IBM Service Representative. Restart the CLAW link.

BFSxx1304E *xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx*

Explanation: The CLAW driver for the indicated front-end processor has encountered a programming or system error. This message appears one or more times after message 1303E. Sixteen bytes of binary trace information are displayed on each line of this message.

Source: LAN Server

System Action: The link is ended.

User Response: Verify that LAN Server and the front-end processor are still operational and restart the link. If the error persists, record the error code and diagnostic data and contact your IBM Service Representative.

BFSxx1305E CLAW request type *number* **failed, CLAW R/C =** *rc*, **logical link =** *number* or **CLAW request type** *number* **failed, CLAW R/C =** *rc*.

Explanation: The CLAW communications link encountered an error while processing the request type indicated. The request types (commands) are:

1 CLAW_INITIALIZATION

2 CLAW_TERMINATION

3 CLAW_OPENADAPTER

4 CLAW_CLOSEADPTER

5 CLAW_CONNECT

6 CLAW_ACCEPT

7 CLAW_DISCONNECT

8 CLAW_SEND

9 CLAW_RECEIVE

10 CLAW_PAGE_RETURN

11 CLAW_QUERY

Source: LAN Server

System Action: The link is ended.

User Response: Verify that LAN Server and the front-end processor are still operational. Issue the START command again. If the error persists, record the text of the message and contact your IBM Service Representative.

Errors on a CLAW_OPENADAPTER usually indicate a configuration, cabling, or front-end processor problem.

Ensure that:

- Both unit addresses are varied on-line
- The MMC adapter cable switch is set to SELECT
- The front-end processor is powered on

Check your host IOCP and front-end processor channel configuration files. Ensure that the OLSID/NFSID, FEPNAME, unit address, and channel speed parameters match in the appropriate configuration files.

Errors on a CLAW_SEND or CLAW_RECEIVE command usually indicate that the front-end processor was stopped or is experiencing a problem. They may not indicate a host problem. Check the LAN Server front-end processor error log and other appropriate error logs; for example, OS/2 Lan Server may be experiencing a buffer shortage.

BFSxx1307E Incorrect length message received from CLAW - expected *number* **bytes, received** *number*.

Explanation: Internal error because of incorrect message length.

Source: LAN Server

System Action: The link ends.

User Response: Contact your IBM Service Representative.

BFSxx1308I Restarting CLAW link to *fepname* **- error code** *number*

Explanation: The CLAW communications link to the front-end processor was lost due to a recoverable error. The CLAW driver is attempting to restart the link.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1310E CLAW link *fepname* **not found.**

Explanation: This message is produced in response to a QUERY LINK command. It indicates that the link name supplied is not known to the file server host program as a CLAW link. Only CLAW links defined in the CONFIG configuration file are valid for this command.

Source: LAN Server

System Action: None.

User Response: Verify that the front-end processor name is defined in the CONFIG configuration file as a CLAW connection. Enter the command with a correct front-end processor name.

BFSxx1320E CLAW driver for FEP *fepname* **unable to allocate storage - error code** *number*, **return code** *return-code*.

Explanation: There was insufficient virtual storage available to satisfy a request from the CLAW device driver for free storage. Note the error code; it may be useful to your IBM Service Representative for debugging purposes.

Source: LAN Server

System Action: The CLAW driver for the indicated front-end processor will shut down.

User Response: Check for any irregular system conditions (such as other unusual messages) that may cause a loop that consumes all free storage. If none is found, increase your region size, and restart LAN Server.

BFSxx1321E CLAW Error code *number* **from FEP** *fepname* **on device** *dev-addr*, **SCSW =** *xxxxxxxx xxxxxxxx xxxxxxxx*, **sense =** *xxxx* or **CLAW Error code** *number* **from FEP** *fepname* **on device** *dev-addr*, **SCSW =** *xxxxxxxx xxxxxxxx xxxxxxxx*, **sense =** *xxxx*, **R/C =** *rc*, **CC =** *cc*

Explanation: One of the two subchannels used for a CLAW connection received an I/O interrupt or ended an I/O operation with an unexpected completion code. The parts of the error message are as follows:

- The Error code describes the internal error code that caused this message to be generated. Record this value; it may be useful to your IBM Service Representative for debugging purposes.
- The FEP value is the name of the front-end processor for which this CLAW link was started.
- The device value is the address or subchannel that returned the error.
- The SCSW is the status value returned from the channel. Its contents are described in the *Principles of Operation* book.
- The sense value displays the sense data returned from the communications adapter if the status value showed a Unit Check. Otherwise, the sense value is meaningless.
- The R/C value, if any, is the return code from the I/O request that resulted in an error. If this value is not displayed, this error was returned in an I/O interrupt.
- The CC value, if any, is the condition code from the I/O request that resulted in an error. If this value is not displayed, this error was returned in an I/O interrupt.

Source: LAN Server

System Action: The CLAW driver for the indicated front-end processor will shut down.

User Response: If the error continues, run hardware diagnostics on the channel adapter card.

If an ESCON-attached front-end processor is powered off after starting the link, an additional START command must be issued on the host before communications can be resumed. This condition is reflected as a channel detected error (interface control check) to the host operating system and to the file server host program. Therefore, no recovery attempt is made.

BFSxx1322E FEP *fepname* **on** *read_dev* **rejected CLAW connection with error code** *number* **and return code** *number***. The following host and FEP names were sent: "***hostname***", "***fepname***" The following host and FEP names were received: "***hostname***", "***fepname***"**

Explanation: The host attempted to establish CLAW communications with the channel communications adapter in the front-end processor, but the front-end processor rejected it. The return code describes the reason for rejecting the connection. The following return codes may appear:

A6 This is the most common code. It indicates that the system names defined for the host and the front-end processor in their respective CONFIG configuration files did not match.

B3 The CLAW version number in the host does not match that in the front-end processor. This indicates that a new version of CLAW has been installed in one machine but not in the other, probably as the result of installing a new version of LAN Server.

B4 The blocksize in use at the host does not match that on the front-end processor.

Source: LAN Server

System Action: The CLAW driver for the indicated front-end processor will not start.

User Response: Examine the return code. If it is in the list above, take the appropriate action as described below. If it is not in the list, contact your IBM Service Representative.

A6 Verify that the name specified in the OLSID statement in BFS.INI matches that specified in the OLSID statement in the CONFIG configuration file. Verify also that the name specified in the FEP_NAME statement in BFS.INI matches that specified in the LINK statement in the CONFIG configuration file.

B3 Verify that the host and the front-end processor are running the same version of LAN Server, and if both have been upgraded recently to a new version, that no files from the previous version still exist on either machine.

B4 Contact your IBM Service Representative.

BFSxx1323E FEP *fepname* **has restarted the CLAW link.**

Explanation: The front-end processor has restarted unexpectedly while the CLAW driver in the host was active.

Source: LAN Server

System Action: The CLAW driver for the front-end processor will restart itself.

User Response: None, unless the front-end processor did not actually restart.

BFSxx1400E Error in *dsname***, line number** *number***.**

Explanation: While processing the specified *dsname* at this line number, an error was detected.

Source: LAN Server

System Action: A specific error message will also be displayed with this message.

User Response: Make a note of the *dsname* and line number. See the other message(s) for specific error details.

BFSxx1401E Processing continues; this record is not processed. or **Processing continues; this keyword is not processed.** or **Processing continues, using default value** *value***.**

Explanation: An error was detected and processing will continue. Other message(s) displayed indicate the error found.

Source: LAN Server

System Action: Processing continues.

User Response: See other messages for specific error details.

BFSxx1402I ESM (External Security Manager) initialization started.

Explanation: The file server host program has displayed a call to verify if an External Security Manager is protecting file server resources.

Source: LAN Server

System Action: The file server host program waits for a response from the External Security Manager.

User Response: If the External Security Manager initialization complete message does not appear, then you need to check on the External Security Manager for any problems.

BFSxx1403I External Security Manager initialization is complete.

Explanation: The file server host program has finished verifying that an External Security Manager is protecting file server resources.

Source: LAN Server

System Action: The file server host program continues processing.

User Response: None.

BFSxx1404E External Security Manager initialization failed. Return code1: *return-code1* **return code2:** *return-code2* **reason code:** *reason*

Explanation: The file server host program has detected an error with the External Security Manager.

Source: LAN Server

System Action: LAN Server shuts down.

User Response: Look up the return codes and reason code in the External Security Manager book. Fix the problem and restart LAN Server.

Note: You must have the CLASS=LFSCLASS defined by your External Security Manager configuration before starting LAN Server.

BFSxx1405E External Security Manager call failed. Return code1: *return-code1* **return code2:** *return-code2* **reason code:** *reason*

Explanation: The file server host program has detected an error with the External Security Manager.

Source: LAN Server

System Action: The specific command or function ends.

User Response: Look up the return codes and reason code in the External Security Manager book. Fix the problem and reissue command or function.

BFSxx1410E Invalid VTAM APPLID: *applid***.**

Explanation: The *applid* specified on the command is not a valid VTAM APPLID name.

If the *applid* is 50 characters long or less, the entire *applid* is shown in the error message. Otherwise, the *applid* will be truncated.

The VTAM APPLID name is a 1- to 8-character name consisting of the characters A-Z, and 0-9 folded to uppercase.

Source: LAN Server

System Action: If you are processing a configuration record, a specific error message will be displayed following this message. If you are processing a command, the command will end.

User Response: See the following message(s) for specific error details. If you are processing a command, reenter the command, specifying a valid *applid*.

BFSxx1411E Invalid data set name: *dsname***.**

Explanation: The *dsname* specified on the command is not a valid data set name.

If the *dsname* is 50 characters long or less, the entire *dsname* is shown in the error message. Otherwise, the *dsname* will be truncated.

The data set name is a 1- to 44-character name consisting of the characters A-Z, 0-9, @,#,$,- folded to uppercase.

Source: LAN Server

System Action: If you are processing a configuration record, a specific error message will be displayed following this message. If you are processing a command, the command will end.

User Response: See the following message(s) for specific error details. If you are processing a command, reenter the command, specifying a valid *dsname*.

BFSxx1412E Invalid single byte character set table name: *sbcs_table***.**

Explanation: The *sbcs_table* specified on the command is not a valid single byte character set table name.

The single byte character set table name is an 8 character name starting with the letters "SB" and ending in a hexadecimal number, folded to uppercase.

Source: LAN Server

System Action: A specific error message will be displayed following this message.

User Response: See the following message(s) for specific error details.

BFSxx1413E Invalid integer value: *integer***.**

Explanation: The *integer* specified on the command is not a valid integer value.

If the *integer* is 50 characters long or less, the entire *integer* is shown in the error message. Otherwise, the *integer* will be truncated.

Source: LAN Server

System Action: If you are processing a configuration record, a specific error message will be displayed following this message. If you are processing a command, the command will end.

User Response: See the following message(s) for specific error details. If you are processing a command, reenter the command, specifying a valid *integer*.

BFSxx1414E Size value: *size* **not valid.**

Explanation: The *size* specified on the FORMATDS command is not a valid size. The size is a decimal value with accuracy of two decimal places. Following the decimal number is a single character consisting of a period, blank, K, M, or G. The *size* of the data set must be at least 256 4K pages (1M) and less than or equal to 1048576 4KB pages (4GB).

Source: LAN Server

System Action: The FORMATDS command is ended.

User Response: Enter the command again, specifying a valid size.

BFSxx1416E Invalid label value: *label***.**

Explanation: The *label* specified on the FORMATDS command is not a valid label.

If the *label* is 50 characters long or less, the entire *label* is shown in the error message. Otherwise, the *label* will be truncated.

The label is a value of 1- to 6-characters consisting of the characters A-Z, and 0-9, folded to uppercase.

Source: LAN Server

System Action: The FORMATDS command will be ended.

User Response: Reenter the command, specifying a valid label.

BFSxx1417E Invalid hexadecimal value: *hexnum***.**

Explanation: The *hexnum* specified on the command is not a valid hexadecimal value.

If the *hexnum* is 50 characters long or less, the entire *hexnum* is shown in the error message. Otherwise, the *hexnum* will be truncated.

The hexadecimal value consists digits from 0-9, and characters A-F, folded to uppercase.

Source: LAN Server

System Action: A specific error message will be displayed following this message.

User Response: See the following message(s) for specific error details.

BFSxx1418E Unexpected end of file in the specified table name: *table***.**

Explanation: An end of file condition has been reached on the specified translation or case table.

Source: LAN Server

System Action: LAN Server ends.

User Response: Make sure all the necessary records are contained in the translation or case table(s).

BFSxx1419E Extraneous parameter *parm* **on command or configuration record.**

Explanation: There is extra parameter on a command or a record in a configuration file.

Source: LAN Server

System Action: If you are processing a configuration record, a specific error message will be displayed following this message. If you are processing a command, the command will end.

User Response: See the following message(s) for specific error details. If you are processing a command, reenter the command, eliminating the extra parameter.

BFSxx1420E Insufficient parameters were specified on command or configuration record.

Explanation: The file server host program cannot run the command because of missing parameters.

Source: LAN Server

System Action: If you are processing a configuration record, a specific error message will be displayed following this message. If you are processing a command, the command will end.

User Response: See the following message(s) for specific error details. If you are processing a command, correct and reenter the command.

BFSxx1421W The security value of *keyword* **is invalid. Processing continues with the default.**

Explanation: The value associated with the security keyword should be either LOCAL or EXTERNAL. Because neither was found, processing continues with the default value of LOCAL.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1422E SVC 99 ended with *errcode* **and** *infcode***.**

Explanation: A call to dynamically allocate a data set using SVC 99 ended with an unexpected error code of *errcode* and an information code of *infcode*.

Source: LAN Server

System Action: The specific command or function ends.

User Response: Look up the action for the SVC 99 codes in the *OS/390 MVS Programming: Assembler Services Reference*.

BFSxx1423E VTAM (non-APPC) command error, command = *cmd***, application name** *name***, return code** *return-code* or
The application name (APPLID) *name* **is being used by another VTAM application. Only one VTAM application at a time can enter an Open ACB using the same APPLID. Return code =** *return-code***, command =** *cmd* or **The VTAM application name** *name* **could not be opened by LAN Server. No entry was found in the active VTAM configuration tables. The entry (APPL statement) is not active or was never created. Return code =** *return-code***, command =** *cmd* or
The application name (APPLID) *name* **could not be opened because VTAM is inactive. Return code =** *return-code***, command =** *cmd*

Explanation: A VTAM command was unsuccessful. Check the return code in the *VTAM Programming* book for the command entered.

Source: LAN Server

System Action: The LAN communication task ends. No further communication is allowed.

User Response: Make sure that:

- VTAM is started.
- The application program major node containing the *name* APPLID is varied on (activated).
- The *name* APPLID itself is active.

Attempt to restart LAN Server. If the problem persists, start local diagnostic procedures for handling system program problems.

BFSxx1424E APPC/VTAM command error: conversation id *convid***, control/qualify code** *code***, primary/secondary codes** *error***, return code** *return-code*

Explanation: An APPC/VTAM command completed abnormally.

Source: LAN Server

System Action: The LAN communications task ends and causes its partner task to end, thereby severing communications to the front-end processor or administrator on the associated pair of paths.

User Response: Attempt to reconnect the front-end processor or administrator to the file server host program. If the problem persists, start local diagnostic procedures for handling system program problems. Check the primary and secondary codes in *OS/390 eNetwork Communications Server: SNA Programmers LU 6.2 Reference*.

BFSxx1425E VTAM has abended or the ACB was halted by an operator command, reason code *reason***.**

Explanation: Either VTAM has abnormally ended or a VTAM operator has entered a command to deactivate a VTAM APPLID needed by LAN Server. All file server host program communications with this VTAM APPLID are halted.

Source: LAN Server

System Action: LAN Server repeatedly attempts to reestablish communications with this VTAM APPLID every 30 seconds.

User Response: Restart VTAM or VARY ON the ACB (application node).

BFSxx1426E The LAN Server message repository cannot be opened. The Return Code=*return-code* or **LAN Server message repository error detected while processing message number** *msgnum* **version** *version***. The Return Code=***return-code*

Explanation: For the first message, the repository of the LAN Server host program messages cannot be located or cannot be opened. A Return Code is given and LAN Server processing is ended.

For the second message, an error was detected while processing a specific LAN Server host program message. The message number, message version and Return Code are given and LAN Server processing continues.

These messages will always be in American English.

Source: LAN Server

System Action: If the first message is issued, the LAN Server host program ends since the message repository cannot be opened. If the second message is issued, processing continues since there is a problem detected while processing an individual message.

User Response: If the first message is issued, verify that the BFSLANG data definition statement allocates the message repository. If BFSLANG is correctly set up and the problem does not go away or if the second message is issued, contact your IBM service representative with the message information and Return Code.

BFSxx1427E PPOST return code *return-code* **from task** *task_name*

Explanation: An error occurred when the post to the indicated task failed with the shown return code.

Source: LAN Server

System Action: The file server host program is shut down.

User Response: Contact your IBM Service Representative.

BFSxx1428I The size entered for the FORMATDS command has been rounded to *size* **4K blocks.**

Explanation: The size of the Linear Data Set (LDS) that will be used by the file server host program must be allocated in multiples of 4K.

Source: LAN Server

System Action: The size has been rounded.

User Response: None.

BFSxx1429E *Function subtype* **ended with return code** *rc* **and reason code** *reason***.** or *Function* **ended with return code** *rc* **and reason code** *reason***.**

Explanation: This is an error using the callable service *function*. The return code, reason code and possible a subtype are all displayed.

Source: LAN Server

System Action: Processing ends.

User Response: See the *OS/390 MVS Programming: Authorized Assembler Services Reference ALE-DYN* book for complete information on the return and reason codes. For some return codes, this book will refer you to look up the codes for dynamic allocation. These can be found in the *OS/390 MVS Programming: Authorized Assembler Services Guide*.

BFSxx1430E Size of a LDS cannot be changed. Original size was *size* **4K blocks.**

Explanation: A previously allocated Linear Data Set (LDS) was to be formatted. The size of the data set and the size specified do not agree.

Source: LAN Server

System Action: Processing ends.

User Response: Reenter the command with the size given in the message. If the size is to be changed, delete the data set and then reenter the FORMATDS command.

BFSxx1431I The application name (APPLID) *name* **is now active.**

Explanation: The file server host program has successfully activated an APPC connection.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1432E The file server host program is not running APF authorized.

Explanation: The file server host program must be APF authorized.

Source: LAN Server

System Action: Processing ends.

User Response: Contact your system support personnel to ensure that the file server host program is APF authorized.

BFSxx1434I CLAW Send session ended from *fepname* **to** *olsid***, logical link** *pathid* or **CLAW Receive session ended from** *fepname* **to** *olsid***, logical link** *pathid* or **NFS CLAW Send session ended from** *fepname* **on socket** *socknum* or **NFS CLAW Receive session ended from** *fepname* **on socket** *socknum*

Explanation: A CLAW communication thread ended its connection to a front-end processor.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1435I CLAW Send session start from *fepname* **to** *olsid***, logical link** *pathid* or **CLAW Receive session start from** *fepname* **to** *olsid***, logical link** *pathid* or **NFS CLAW Send session start from** *fepname* **on socket** *socknum* or **NFS CLAW Receive session start from** *fepname* **on socket** *socknum*

Explanation: A CLAW communication thread has started a connection to the front-end processor.

Source: LAN Server

System Action: None

User Response: None

BFSxx1437E Error opening *dsname* used during access control processing.

Explanation: This message is displayed during LAN Server access control processing. A temporary data set is used during this processing, and a problem was encountered opening it.

Source: LAN Server

System Action: Processing of the LAN Server Access Control File ends.

User Response: Contact the LAN Server system administrator. When the problem has been corrected, restart LAN Server.

BFSxx1438E *dsname* data set name is too long for access control.

Explanation: The Access Control File name must be nine characters less than the system allowable maximum because the file server host program will allocate a temporary data set with `.$ACCSCTL` concatenated to the data set name.

Source: LAN Server

System Action: Processing of the Access Control File ends and the file server host program stops.

User Response: Rename the Access Control File so that the name is 35 characters or less. Restart LAN Server.

BFSxx1439E The system was unable to create a new VSAM LDS.

Explanation: To create a new VSAM linear data set dynamically using callable services, DFP 3.1 or later must be running and SMS must be active.

Source: LAN Server

System Action: Processing ends.

User Response: If SMS is not active on the system, use IDCAMS to allocate a VSAM Linear Data Set (LDS). Then use FORMATDS to put it into file server format.

BFSxx1440E Invalid password: *password*

Explanation: The password specified as the value of the AUTHPW keyword on the LFSCMD command is not usable.

If the unusable value is 50 characters long or less, the entire value is shown in the error message. Otherwise, the value will be truncated.

A password is a 1- to 8-character string. The password on the LFSCMD command must match the password specified for the application name designated with the AUTHNAME keyword. If the AUTHNAME keyword is not used, LFSCMD interprets the user ID as an application name.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid password.

BFSxx1441E The LFSCMD command was displayed without a VTAM application name designating the file server host program. or **The LFSBR command was displayed without a VTAM application name designating the file server host program.**

Explanation: A file server host program was not identified by a VTAM application name. The LFSCMD or LFSBR command cannot complete.

Source: LAN Server

System Action: The LFSCMD or LFSBR command ends.

User Response: Enter the LFSCMD or LFSBR command again, specifying the VTAM application name associated with the file server. This name must match the parameter specified on the ADMINID record of the CONFIG configuration file.

BFSxx1444E LFSCMD cannot successfully read from the terminal. The code returned is *rc*.

Explanation: LFSCMD found an error trying to read from the terminal.

Source: LAN Server

System Action: LFSCMD ends.

User Response: A return code of 12 indicates that prompting was disabled.

- From TSO/E, enter PROFILE PROMPT to enable prompting.
- From a clist, enter CONTROL PROMPT.
- From a REXX exec, enter CALL PROMPT 'ON'.

A return code of 4 indicates that the read was canceled by an attention interrupt form the terminal. Enter the command again, without using the attention interrupt key.

BFSxx1445W Help for the file server host program is only available from an ISPF environment.

Explanation: A help command was entered in a non-ISPF environment. Help is not available from such an environment.

Source: LAN Server

System Action: LFSCMD either ends or returns to the command prompt.

User Response: Request help while in the ISPF environment.

BFSxx1446E ISPF returned a code of *code* while attempting to display the help panel for *panel*.

Explanation: An error occurred while trying to display an ISPF help panel.

Source: LAN Server

System Action: LFSCMD or LFSBR either ends or returns to the command prompt.

User Response: Ensure that the ISPF help panels for the file server host program are allocated. The DDNAMEs for SBFSPLIB and SBFSPTBL must be allocated to the ISPPLIB and ISPPROF data definitions, respectively. Enter the command again.

BFSxx1447W The termination keyword exceeds the maximum allowed length of 32. The word END will be used in the prompt for file server host program commands.

Explanation: The termination keyword exceeds the maximum allowed length of 32 and cannot be used in the prompt for file server host program commands.

Source: LAN Server

System Action: LFSCMD will use the word `END` instead.

User Response: To enable the translation of the termination keyword, contact your IBM Service Representative.

BFSxx1448W An error (rc=*rc*) was encountered retrieving the termination keyword from the message repository. The word END will be used in the prompt for the file server's commands.

Explanation: An error occurred while retrieving the termination keyword from the message repository.

Source: LAN Server

System Action: LFSCMD will use the word `END` instead.

User Response: To enable the translation of the termination keyword, contact your IBM Service Representative.

BFSxx1449E An expected Query NLS Response was not received.

Explanation: An internal Query NLS hand-shake was sent to the file server but the expected response was not received. LFSCMD cannot continue without a copy of the codepage used by the file server.

Source: LAN Server

System Action: LFSCMD ends.

User Response: Contact your IBM Service Representative.

BFSxx1450E The library of runtime routines is at *ver.rel.mod* level *lvl*. LAN Server requires at least *ver.rel.mod* level *lvl*. LAN Server cannot continue.

Explanation: Your installation does not have the required level of the library of runtime routines that are provided as an APAR to Data Facility Product (DFP) Version 3 and Data Facility System Managed Storage (DFSMS) Version 1.1.0. See *OS/390 Program Directory* for specific APAR information.

Source: LAN Server

System Action: LAN Server ends.

User Response: To determine the level of the library interactively, invoke the module DMSSVM5. To determine the level by using a batch job, enter:

```
// EXEC PGM=DMSSVM5,PARM='HISTORY'
```

Contact your system support personnel to ensure that the library is at the correct level.

BFSxx1451E The C library is not available, unable to continue.

Explanation: The C runtime library is not available. Either the C/370 or LE/370 runtime library must be available for LFSCMD to continue.

Source: LAN Server

System Action: LFSCMD ends.

User Response: Contact your system support personnel.

BFSxx1452I LAN Server accounting record successfully written to SMF.

Explanation: This message appears on the first successful write to System Management Facilities (SMF) when LAN Server is starting or after a previously noted error writing accounting records to SMF has been resolved.

Source: LAN Server

System Action: LAN Server continues processing.

User Response: None.

System Programmer Response: None.

BFSxx1453W LAN Server accounting record was not successfully written to SMF. The return code from SMF is *rc*

Explanation: This message appears on the first unsuccessful write to System Management Facilities (SMF) with a return code that is different from a previously noted return code from SMF. Accounting records will be lost until the problem writing to SMF is resolved.

Source: LAN Server

System Action: LAN Server continues processing and will continue trying to write accounting records to SMF.

User Response: None.

System Programmer Response: Determine meaning of the return code from SMF and correct.

BFSxx1454E The catalog search for the specified data set failed.

Explanation: The command to allocate a data set was unsuccessful at the catalog search phase.

Source: LAN Server

System Action: The data set is not allocated.

User Response: Determine the reason for the recall problem and reenter the command.

BFSxx1455I The specified data set is archived; a recall for the data set has been initiated.

Explanation: It was determined that the data set is archived to backup media.

Source: LAN Server

System Action: A request was initiated to recall the data set.

User Response: If the recall request completes in time to finish the user request, there is no action required. If the request does not complete in a timely fashion, reenter the command after the recall request is complete. If the requested recall is unsuccessful, determine the reason for the error, correct the problem, and reenter the command.

BFSxx1456E The specified data set is archived; an error occurred attempting to recall the data set.

Explanation: The request to have the data set recalled from archive media was unsuccessful.

Source: LAN Server

System Action: The data set will not be used by the file server host program.

User Response: Determine the reason for the recall problem and reenter the command.

BFSxx1457E An error occurred trying to dynamically allocate the specified data set.

Explanation: An error occurred during the allocation of a data set. This may occur, for example, if the number of dynamic allocations for the task has exceeded the installation-defined maximum.

Source: LAN Server

System Action: The data set is not allocated.

User Response: If any messages appear prior to this message, use the response section of those messages to determine the proper action to take. If no messages occur, determine if your installation has any requirements on dynamic allocation requests.

BFSxx1458E An error occurred trying to access the specified data set.

Explanation: A system error occurred while trying to access the data set.

Source: LAN Server

System Action: The data set will not be accessed.

User Response: Follow the response section of the preceding message(s) to determine the proper action to take.

BFSxx1460I The command is not being accepted by LAN Server.

Explanation: Your installation does not allow the host system command to be processed by LAN Server.

Source: LAN Server

System Action: The command is not processed.

User Response: If the system command facility to LAN Server is required, use the file server MVSCONS command to change the type of commands to be accepted by LAN Server for this invocation. Use the MVSCONS configuration record to make a permanent change.

BFSxx1461E This command is not allowed because an External Security Manager is specified in the OS2LFS configuration file for access control.

Explanation: The OS2LFS configuration file has SECURITY EXTERNAL specified, therefore access control is being defined and verified by an External Security Manager. As a result, the file server host program local access control mechanisms (provided by the OLSACCS and related commands) cannot be used.

Source: LAN Server

System Action: The command is not processed

User Response: Change the SECURITY record in the OS2LFS configuration file to SECURITY LOCAL to use the OLSACCS commands for specifying access control. When SECURITY EXTERNAL is specified, you must use the access control commands provided by the External Security Manager.

BFSxx1462E The data set cannot be found or is allocated by another task.

Explanation: The specified data set cannot be allocated by the file server host program. The data set may not exist, is not cataloged, or the file server does not have permission from the security manager to allocate the data set.

Source: LAN Server

System Action: The command is not processed.

User Response: Verify that the data set exists, is cataloged, and that the file server has permission to access the data set.

BFSxx1463E MEMBER used with sequential data set.

Explanation: The specified data set is physical sequential, but the MEMBER option was used.

Source: LAN Server

System Action: The command is not processed.

User Response: Verify that the correct data set name was entered and enter the command again, without the MEMBER option.

BFSxx1464W Member name * assumed with PDS or PDS/E *dataset*.

Explanation: The specified data set is either a PDS or PDS/E, but the MEMBER option was not used.

Source: LAN Server

System Action: MEMBER * is assumed.

User Response: Verify that the correct data set name was entered.

BFSxx1465E The data set is not a sequential data set, PDS, or PDS/E.

Explanation: The specified data set is not a sequential data set, a PDS, or a PDS/E. These are the only supported data set types for the COPY command.

Source: LAN Server

System Action: The command is not processed.

User Response: Verify that the correct data set name was entered. If the data set is a file server host program linear data set, the data set must be added using the LFSDSN command or configuration record.

BFSxx1466W *dsname* **cannot be released by the file server host program.**

Explanation: The specified data set is was allocated by the file server host program. but cannot be released.

Source: LAN Server

System Action: The command is complete. The data set remains allocated to the file server.

User Response: Verify from the job log and system log that there are no errors with the data set.

BFSxx1467W The DCB for the data set cannot be read.

Explanation: The specified data set characteristics cannot be determined. The data set name is listed in the previous message.

Source: LAN Server

System Action: The command is not processed.

User Response: Verify from the job log and system log that there are no errors with the data set. Then, contact your IBM service representative.

BFSxx1468I Copying the sequential data set to a file. or **Copying the sequential data set to a target directory.** or **Copying a PDS to the target file.** or **Copying a PDS to the target directory.**

Explanation: The file server host program has compared the operands specified on the COPY command to the current contents of the source and target data sets and will perform the copy operation described in the message.

Source: LAN Server

System Action: If no options were specified that conflict with the source and target operands, the file server host program will begin processing the COPY command. Additional messages will display indicating the results of the COPY command and how many files were successfully copied. Then, processing of the administration request ends.

User Response: None.

BFSxx1469E Both *ds1* and *ds2* are non-LAN Server data sets.

Explanation: At least one of the data sets specified on the COPY command must be a LAN Server data set defined via the LFSDSN command or configuration record.

Source: LAN Server

System Action: The command is ended.

User Response: Verify that the correct data sets are entered.

BFSxx1470E A read error occurred on *dsname*.

Explanation: The specified data set cannot be read.

Source: LAN Server

System Action: The command is ended.

User Response: Verify from the job log and system log that there are no errors with the data set. Then, contact your IBM service representative.

BFSxx1471E A CLOSE error occurred on *dsname*.

Explanation: The specified data set cannot be closed.

Source: LAN Server

System Action: The command is ended.

User Response: Verify from the job log and system log that there are no errors with the data set. Then, contact your IBM service representative.

BFSxx1472E *parameter* is not valid with the data sets entered.

Explanation: The specified parameter was entered and is not valid with the data sets used. For example, SPACE may not be entered if the target of the COPY command is a LAN Server linear data set.

Source: LAN Server

System Action: The command is ended.

User Response: Enter the command again with the correct parameters.

BFSxx1473E The DCB options *recfm*, *blksize*, *lrecl* are not compatible.

Explanation: The specified parameters entered are not compatible. For fixed format files, the block size must be a multiple of the logical record length. For variable format files, the block size must allow for the four-byte record length per logical record length.

Source: LAN Server

System Action: The command is ended.

User Response: Enter the command again with the correct parameters.

BFSxx1474E Dynamic allocation of *dsname* failed with *rc ec*. Data set cannot be created.

Explanation: The specified data set cannot be created. A return code of FFFF9700 occurs if the file server host program does not have authority to create the data set.

Source: LAN Server

System Action: The command is ended.

User Response: Refer to the return and error code in the same manual as message 1429.

BFSxx1475E The data set already exists and SPACEOPTS were specified.

Explanation: The specified data set was found and SPACEOPTS were specified. The file server host program cannot be used to delete and allocate a data set. If this what you want, have the file server host program administrator issue the TSO/E DELETE command, and then issue the file server's COPY command with the SPACEOPTS option.

Source: LAN Server

System Action: The command is not processed.

User Response: Verify that the data set was entered correctly.

BFSxx1476E The target PDS or PDS/E member name *name* is not valid.

Explanation: A target PDS or PDS/E member name can be either a complete member name or a wildcard (*), but the target data set name cannot include characters and the wildcard. For example, the target PDS or PDS/E member name cannot be A*A.

Source: LAN Server

System Action: The command is not processed.

User Response: Verify that the data set member name was entered correctly.

BFSxx1477E A write error occurred on *dsname*; A partial copy may have been done.

Explanation: The specified data set cannot be written.

The data set is full and a X'37' ABEND occurred. This can be verified by looking at the file server host program job log or the system console log.

Source: LAN Server

System Action: The command is ended.

User Response: Verify from the job log and system log that there are no errors with the data set. Also, verify the contents of the target data set before trying the command again.

BFSxx1478E TEXT or BINARY specified when copying between two LAN Server data sets.

Explanation: BINARY or TEXT translation only applies when copying data between a LAN Server linear data set and an sequential data set or PDS.

Source: LAN Server

System Action: The command is ended.

User Response: Verify that the data set names and the options were entered correctly. Then, enter the command again.

BFSxx1479E APPEND was specified to an existing PDS or PDS/E member.

Explanation: An existing PDS or PDS/E member cannot be appended. Refer to *DFSMS/MVS Using Data Sets*, section STOW-Updating the Directory for more information.

Source: LAN Server

System Action: The command is ended.

User Response: Verify that the data set names and the options were entered correctly. Reenter the command.

BFSxx1480W PDS/E option requested without PDS/E support installed. DIR 1 option used.

Explanation: The target data set is requested as a PDS/E. DFP 3.2 or higher is required support for PDS/E and it is not installed.

Source: LAN Server

System Action: DIR 1 option is used.

User Response: Verify that the command was entered correctly and that the system has the correct version of DFP (Data Facilities Product).

BFSxx1481E Error doing an erase.

Explanation: An error occurred while processing the ERASE command. The file or directory name specified does not exist, or was entered incorrectly.

Source: LAN Server

System Action: Processing ends and no erase is performed.

User Response: Verify the correct file or directory name and enter the command again.

BFSxx1482E The ERASE command cannot be used to remove a directory.

Explanation: An incorrect command was entered. The ERASE command can only be used to erase files.

Source: LAN Server

System Action: None.

User Response: Use the DELETE DIRECTORY command to remove a directory.

BFSxx1483E Processing continues using the default number of requests *number***.**

Explanation: The ACCOUNT command specified an incorrect number of user requests.

Source: LAN Server

System Action: Processing continues using the default number of requests.

User Response: Enter the ACCOUNT command again with a valid number.

BFSxx1484E Incorrect export name: *exportname***.** or **Cannot add the following export name:** *exportname***.**

Explanation: The *exportname* specified on the command or record is not a valid export name or cannot be added.

If the *exportname* is 50 characters long or less, the entire *exportname* is shown in the error message. Otherwise, the *exportname* will be truncated.

If you are using the EXPORTS MODIFY command and the data set cannot be added, there may be an error in the entry for this data set in the EXPORTS Configuration File.

Source: LAN Server

System Action: If you are processing a configuration record, processing continues and this record is not processed. If you are processing a command, the command ends.

User Response: Additional message(s) will provide specific error details.

If you are processing a command, enter the command again, specifying a valid *dsname*.

If you are using the EXPORTS MODIFY command, correct the entry in the EXPORTS configuration file.

BFSxx1485E The OS/2 read-only attribute is set for the target file.

Explanation: The target file has the OS/2 read-only attribute set and can not be updated by the COPY command.

Source: LAN Server

System Action: None.

User Response: Remove the read-only attribute setting using the OS/2 ATTRIB command.

BFSxx1486E Incorrect string *string* **on XPERM option.**

Explanation: The *string* specified on the command SET ATTRIB is not a valid string.

If the *string* is 50 characters long or less, the entire *string* is shown in the error message. Otherwise, the *string* will be truncated.

Source: LAN Server

System Action: The command ends.

User Response: Enter the command again, specifying a valid *string*.

BFSxx1487E Incorrect TCP/IP address space: *tcpipid***.**

Explanation: The *tcpipid* specified is not a valid TCP/IP address space.

If the *tcpipid* is 50 characters long or less, the entire *tcpipid* is shown in the error message. Otherwise, the *tcpipid* will be truncated.

Source: LAN Server

System Action: A specific error message displays following this message to locate the record in error.

User Response: See the following message(s) for specific error details.

BFSxx1488E The host internet address is not valid.

Explanation: This message is issued for two conditions. The host internet address in the TRACE NFS command is in error or the host internet address specified in a LFSNFS configuration file NOPCNFSAUTH record is in error.

Source: LAN Server

System Action: If the message was issued during TRACE NFS command processing the command is not processed. If the message was issued during the file server host program NOPCNFSAUTH record processing the record is not processed. Note, the file server host program will assume that this user is using the PCNFSD Authentication verification protocol for MOUNT processing. Consequently, authentication verification will fail for this user.

User Response: If the message was issued during TRACE NFS command processing correct the command and enter it again. If the message was issued during file server NOPCNFSAUTH record processing correct the record and restart LAN Server.

BFSxx1489E Missing export path: *exportname***.**

Explanation: The export record did not specify a path to be exported.

Source: LAN Server

System Action: The export record is not processed. Processing continues.

User Response: Correct the export record. Enter an EXPORT MODIFY command for the export name.

BFSxx1490E Syntax error in EXPORTS configuration file record for export name: *exportname***.**

Explanation: The export record contains an incorrect value.

Source: LAN Server

System Action: The export record is not processed. Processing continues.

User Response: Enter an EXPORT MODIFY command for the export name.

BFSxx1491E Mount path name is too long: *exportpath***.**

Explanation: The export record contains a path whose name is longer than 1024 characters.

Source: LAN Server

System Action: The export record is not processed. Processing continues.

User Response: Correct the export record so that the export path name is 1024 or fewer characters. Enter an EXPORT MODIFY command for the export name.

BFSxx1492E Export name is too long: *exportname***.**

Explanation: The export record contains an export name longer than 12 characters.

Source: LAN Server

System Action: The export record is not processed. Processing continues.

User Response: Correct the export record so that the export name is 12 or fewer characters. Enter an EXPORT MODIFY command for the export name.

BFSxx1493I There are no exported file systems.

Explanation: No directories have been exported.

Source: LAN Server

System Action: None

User Response: None

BFSxx1494E Incorrect client name: *clientname***.**

Explanation: A record in the EXPORTS configuration file contains a client name in the access list or the read/write list which is longer than 255 characters or contains an imbedded blank.

Source: LAN Server

System Action: The export record is not processed. Processing continues.

User Response: Correct the client name and issue an EXPORT MODIFY command for this export record.

BFSxx1495E Delete failed for source data set *dsname***.** or **Delete failed for source data set member** *dsname(member)***.** or **Delete failed for file server file.**

Explanation: The source data set was copied, but it could not be deleted.

Source: LAN Server

System Action: COPY command processing ends immediately.

User Response: Enter the COPY command again with the REPLACE and DELETE options. Possibly the source data set or file is in use by another user. If the problem continues, extended error information can be obtained through the external trace facility. Or, you may use your local diagnostics procedures to handle system program problems.

BFSxx1500I COMAPI request to clear a COMAPI connection which does not exist. Connection name is *tcpip_address***.**

Explanation: The request to clear a connection was for a TCP/IP address which was not connected.

Source: LAN Server

System Action: The LFSCMD command is not processed.

User Response: Determine correct address and reissue LFSCMD COMAPI command.

BFSxx1502I COMAPI was missing a port number. The file server host program used 1657 as the default port number.

Explanation: The COMAPI command did not specify a port.

Source: LAN Server

System Action: The file server host program issued listen using default port number 1657.

User Response: None, message was issued to document port number on which the file server is listening for requests.

BFSxx1503I COMAPI was missing a TCP/IP address and a port number.

Explanation: The COMAPI command did not specify a TCP/IP address or port.

Source: LAN Server

System Action: The file server host program rejected the LFSCMD subcommand or configuration request.

User Response: Supply the missing TCP/IP address and port number and (re)issue LFSCMD subcommand COMAPI.

BFSxx1504I COMAPI requires a request type of either MAKE or CLEAR.

Explanation: The input command line did not specify any options after COMAPI.

Source: LAN Server

System Action: LAN Server rejected the LFSCMD subcommand or configuration request COMAPI.

User Response: Reissue the LFSCMD subcommand with the appropriate parameters.

BFSxx1505I SET ATTRIB LFSCMD subcommand specified a TOKEN *tokname* which already has been set for a different file.

Explanation: The TOKEN name *tokname* specified on the SET ATTRIB command cannot be created because a file with the same name already exists.

Source: LAN Server

System Action: LAN Server rejected the SET ATTRIB command, the token name, which can be used to access the file currently, is still available.

User Response: Pick a different token_value and reissue the SET ATTRIB command.

BFSxx1506I SET ATTRIB LFSCMD subcommand specified a CLTOKEN *tokname* which does not exist.

Explanation: The CLTOKEN name *tokname* specified on the SET ATTRIB command cannot be found.

Source: LAN Server

System Action: LAN Server rejected the SET ATTRIB command.

User Response: Correct the token_value and reissue the SET ATTRIB command.

BFSxx1507I Unable to obtain address for host name *tcpipadr*. *tcpipverb* was issued.

Explanation: The input host address could not be translated to a valid TCP/IP address.

Source: LAN Server

System Action: The file server host program will not obtain TCP/IP address for *tcpipadr*.

User Response: Follow local procedures for determining why name cannot be resolved into a TCP/IP address, correct problem and restart LAN Server or issue command COMAPI.

BFSxx1509I COMAPI request *requesttype* is invalid.

Explanation: The input command line did not specify MAKE or CLEAR for COMAPI.

Source: LAN Server

System Action: The file server host program will not process the LFSCMD subcommand or configuration request COMAPI.

User Response: Reissue COMAPI request with either MAKE or CLEAR.

BFSxx1510I *diagnostic_information*

Explanation: Dump information for diagnosing task failures.

Source: LAN Server

System Action: Write message to external trace file to help diagnose cause of failure.

User Response: None.

BFSxx1511I TCP/IP address *tcpip_address* and port number *port* supplied were already in use.

Explanation: The request to connect for the TCP/IP address and port cannot be honored because a connection already exists for that address and port.

Source: LAN Server

System Action: The file server host program is unable to successfully process COMAPI request. A connection for the command API was not established.

User Response: Determine correct address and reissue LFSCMD subcommand COMAPI.

BFSxx1512I Unable to start tasks for COMAPI. The number of COMAPI connections exceeds 50.

Explanation: The COMAPI command cannot be honored. The maximum of 50 connections has been reached. There are no free processors for attachment.

Source: LAN Server

System Action: The number of COMAPI connections is greater than 50. The current COMAPI request could not be honored.

User Response: Reduce the number of COMAPI connections and reissue COMAPI command.

BFSxx1515I SET ATTRIB LFSCMD subcommand specified a TOKEN *tokname* which contains an invalid character.

Explanation: The TOKEN name *tokname* specified on the SET ATTRIB command contains the invalid character(s) "/" or "\" or "?" or "*".

Source: LAN Server

System Action: LAN Server rejected the SET ATTRIB command.

User Response: Correct the token_value by replacing the "/", "-", "?" or "*" character and reissue the SET ATTRIB command.

BFSxx1516I The file server host program is recovering a task which experienced an abnormally event error code *abend-code*.

Explanation: LAN Server multitasking supervisor has encountered a situation from which it needs to recover. Recovery has begun. Contact your IBM Service Representative with the abend code.

Source: LAN Server

System Action: LAN Server has started recovery processing. Diagnostic information is being written to the external trace file. When recovery is complete message 1518 will be issued. If LAN Server is unable to recover then additional messages will be issued.

User Response: If this problem occurs frequently or causes problems, notify the system programmer so that problem determination can begin and an IBM Service Representative can be called. An external trace of LAN Server will provide additional information on the cause of the problem. The abend codes are: Restart LAN Server.

30 Request Queues were damaged.

31 Data structure of the storage manager was damaged.

40 PQE lock error.

41 PQE pipe error.

42 Timer error.

43 Fast fit buffer lock error.

44 Control block lock error.

50 Source page header failed validation.

51 Source page header was not on page boundary.

52 Source page header eyecatcher was not valid.

53 Source page header unused slot count was not valid.

54 Source page header offset to unused slot was not valid.

55 Error from allocate.

56 Header error on global block.

61 Invalid user block.

62 Lock manager error.

BFSxx1517I The file server host program is recovering from a program check.

Explanation: A program check interrupt occurred. LAN Server is recovering from the program check.

Source: LAN Server

System Action: LAN Server has started recovery processing. Diagnostic information is being written to the external trace file. When recovery is complete message 1518 will be issued. If LAN Server is unable to recover then additional messages will be issued.

User Response: If this problem occurs frequently or causes problems, notify the system programmer so that problem determination can begin and an IBM Service Representative can be called. An external trace of LAN Server will provide additional information.

BFSxx1518I A file server host program task has been recovered successfully.

Explanation: A LAN Server task experienced a problem which has been corrected.

Source: LAN Server

System Action: LAN Server continues to run.

User Response: None

BFSxx1519E User id *userid* **is not authorized to issue following request** *LFSCMD_subcommand***.**

Explanation: The user id which issued the request does not have authority to execute the file server host program request.

Source: LAN Server

System Action: The command is not processed.

User Response: Correct the command or obtain the necessary authority and enter it again.

BFSxx1520E Unable to initialize COMAPI. The *taskname* **task failed.**

Explanation: The COMAPI command cannot be honored. The indicated task did not complete successfully and prohibits completion of the COMAPI command. An UNIX System Services OS/390 Callable Service has failed.

Source: LAN Server

System Action: Processing stops on the current COMAPI request and returns an error condition.

User Response: Contact system help for UNIX System Services OS/390 or TCPIP.

BFSxx1521E Invalid parameter(*parm***) in COMAPI input structure for LFSCMD administrative command:** *cmd*

Explanation: A parameter was incorrect for the input data structure of the LFSCMD command sent through COMAPI services.

Source: LAN Server

System Action: Processing stops on the current LFSCMD request and returns an error condition.

User Response: Correct the parameter and re-submit the command.

BFSxx1522E COMAPI was unable to verify the host's address.

Explanation: The COMAPI command does a verification of the host address with the client's requested connection address. In this case, the host address could not be retrieved and the command was rejected.

Source: LAN Server

System Action: The file server host program rejected the LFSCMD subcommand or configuration request.

User Response: Retry the LFSCMD subcommand or configuration.

BFSxx1523E COMAPI requested *tcpip_address* **is invalid for this host.**

Explanation: The requested TCP/IP connection address is not on this host.

Source: LAN Server

System Action: The file server host program will reject the LFSCMD subcommand or configuration request COMAPI.

User Response: Reissue COMAPI request with a valid TCP/IP address.

BFSxx1524I COMAPI MASKVALUE was truncated to 16 characters.

Explanation: The COMAPI command had a mask value field greater than 16 characters.

Source: LAN Server

System Action: The mask value field was truncated to 16 characters.

User Response: None.

BFSxx1525I COMAPI had keyword MASKVALUE without an associated value.

Explanation: The COMAPI command line used the keyword MASKVALUE but a value was not given.

Source: LAN Server

System Action: Processing continues with the assumption that there is no mask.

User Response: If a mask value was intended, use the COMAPI CLEAR command for the address and port just created; then reissue the COMAPI MAKE command correctly.

BFSxx1526I COMAPI had keyword PEERNAME without an associated value.

Explanation: The COMAPI command line used the keyword PEERNAME but a value was not specified.

Source: LAN Server

System Action: Processing continues without a peer name.

User Response: If a peer name was intended, use the COMAPI CLEAR command for the address and port just created; then reissue the COMAPI MAKE command correctly.

BFSxx1527E COMAPI has invalid parameters.

Explanation: The COMAPI command line has invalid parameters.

Source: LAN Server

System Action: The command is rejected.

User Response: Correct the command line and resubmit.

BFSxx1600I Your background *command* command has been started.

Explanation: The specified *command* has been started. Since the *command* may be long-running, it is started in the "background", so that other commands may be issued and processed. This message does not indicate that the *command* is complete; only that the command has been started.

Source: LAN Server

System Action: The *command* will run in the "background", and any subsequent error messages or responses will be sent to the host system and JOB logs.

User Response: No action is required. To view the results of the background command, refer to the host system log or the JOB log for the file server host program.

BFSxx1601I Your background *command* command could not be started.

Explanation: The specified *command* could not be started by LAN Server.

This message will be preceded by a more specific message indicating exactly why the *command* could not be started.

Source: LAN Server

System Action: Processing of the *command* is terminated.

User Response: Use the preceding message to determine why the *command* could not be started, and reissue the *command* after correcting the problem.

BFSxx1602I There are already *count* background commands active.

Explanation: The file server host program was not able to start another background command, because the maximum number of concurrent background commands has already been reached.

Source: LAN Server

System Action: The background command is not started.

User Response: Wait until one (or more) of the active background commands completes, and then reissue the failed command. Since background commands issue error and information messages to the host system and JOB logs, view those logs to determine when the active background commands have completed.

BFSxx1603E Too many volumes specified for striped dataset. Maximum of 256 volumes supported. or **Not enough volumes specified for striped dataset. Minimum of 2 volumes required.**

Explanation: A minimum of 2 volumes are required for DASD striping with a maximum of 256 volumes supported.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure the number of volumes is within the specified range and re-execute FORMATDS command.

BFSxx1604E Blocking factor specified is invalid.

Explanation: The specified blocking factor was either too small or too large. The blocking factor must be a minimum of 15 4K blocks and a maximum of 256 4K blocks.

Source: LAN Server

System Action: Processing ends.

User Response: Re-issue the FORMATDS command with a blocking factor within the proper range.

BFSxx1605E Striped dataset name cannot exceed 35 characters.

Explanation: The dataset name specified on the FORMATDS command line for striped datasets must not be more than 35 characters. FORMATDS appends .STRP0xxx to the name for each member of the striped dataset that is formatted.

Source: LAN Server

System Action: Processing ends.

User Response: Re-issue the FORMATDS command with a dataset name no more than 35 characters in length.

BFSxx1606E *function* MACRO ended with return code *return-code* processing volume *volser* or ***function* MACRO ended with return code *return-code* processing dataset *dsname*** or ***function* MACRO ended with return code *return-code*, reason *reason* processing volume *volser*** or ***function* MACRO ended with return code *return-code*, reason *reason* processing dataset *dsname***

Explanation: An unexpected error was encountered using the *function* MACRO while processing the given dataset or volume. The return code *return-code* from the macro invocation is displayed. If a reason code is provided by the MACRO, it is also shown.

Source: LAN Server

System Action: Processing ends.

User Response: Refer to *OS/390 MVS Programming: Assembler Services Reference* for details on the MACRO return and reason codes. The dataset or volume that encountered the error is shown, the user should check the status of the dataset or volume along with the return and reason codes from the macro. If the user can't correct the problem themselves, they should contact their system administrator.

BFSxx1607E Member of striped dataset - *name* **does not reside on volume** *volser***.**

Explanation: For DASD striping, there must be a one to one correspondence between the individual dataset members of the striped dataset and the volumes specified in the user volume list. Thus, the dsn.STRP0001 dataset must reside on the first volume specified in the user volume list, the dsn.STRP0002 must reside on the second volume and so on.

Source: LAN Server

System Action: Processing ends.

User Response: The user should ensure that any members of a striped dataset that they pre-allocate before invoking the FORMATDS command correspond one to one with the volume list they provide to the FORMATDS command. The user should also ensure that the volumes specified are not SMS managed and then re-invoke the FORMATDS command.

BFSxx1608E Member of striped dataset - *name* **cannot reside on an SMS managed volume.**

Explanation: It was found that the member of the striped dataset - *name* resides on a volume that is SMS managed. Striped datasets are not allowed to reside on (either fully or partially) SMS managed DASD.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that all volumes that will contain a striped dataset are not SMS managed and then re-invoke the FORMATDS command.

BFSxx1609W Member of striped dataset - *name* **will occupy multiple extents.**

Explanation: It was found that the member of the striped dataset - *name* resides on more than one DASD extent, or will require secondary extents when formatted.

Source: LAN Server

System Action: Processing continues.

User Response: The performance of datasets with secondary extents may be slightly worse than datasets with just a single extent. The performance degradation depends on the number of extents used. If desired, redefine the members of the striped dataset and ensure that the members occupy only one extent each.

BFSxx1610E Member of striped dataset - *name* **is too small. Required size is** *size* **4K blocks.**

Explanation: It was found that the member of the striped dataset is too small based on the size specified by the user on the FORMATDS command. Each member of striped dataset must be at least large enough to contain its portion of the overall size of the striped dataset.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that any members of striped datasets that they pre-allocate are large enough to occupy their portion of the overall dataset size specified on input to the FORMATDS command. In general its best to allow FORMATDS to dynamically allocate the DASD. Re-invoke the FORMATDS command after correcting the above.

BFSxx1611E Error defining member of striped dataset - *name* **Return code** *return-code* **from DEFINE CLUSTER command.**

Explanation: FORMATDS could not dynamically allocate the member of a striped dataset with the Access Method Services DEFINE CLUSTER command. The error messages issued by DEFINE CLUSTER have been presented along with this message.

Source: LAN Server

System Action: Processing ends.

User Response: The most likely cause of the problem is that the striped dataset size causes FORMATDS to allocate too large a dataset on a particular DASD volume. If this is the case, either re-invoke FORMATDS with a smaller size or specify size as MAX. Refer to *DFSMS/MVS Access Method Services for VSAM* for more information on the DEFINE CLUSTER command.

BFSxx1612I Member of striped dataset - *name* **allocated on volume** *volser***.**

Explanation: FORMATDS has successfully allocated the member of the striped dataset with the Access Method Services DEFINE CLUSTER command on the indicated volume.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1613E Error accessing member of striped dataset. *name* **is RACF protected.** or **Error accessing member of striped dataset.** *name* **is unavailable.** or **Error accessing member of striped dataset.** *name* **- volume is not mounted.** or **Unknown error accessing member of striped dataset -** *name***.**

Explanation: An error was encountered accessing the indicated member of the striped dataset. In this case the member of the striped dataset exists but FORMATDS could not access it for the indicated reason.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that the member of the striped dataset is not password protected or not already in use by another user. If an unknown error was indicated contact your system administrator.

BFSxx1614E Error accessing the volume list dataset. Dataset is RACF protected. or **Error accessing the volume list dataset. Dataset is unavailable.** or **Error accessing the volume list dataset. The volume is not mounted.** or **Unknown error accessing the volume list dataset.** or **Error accessing the volume list dataset. Dataset does not exist.** or **Error accessing the volume list dataset. Dataset cannot be allocated.**

Explanation: An error was encountered accessing the volume list dataset. The error is indicated in the message. If the dataset could not be allocated then the error messages issued by the TSO/E ALLOCATE command are also presented.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that the volume list dataset exists and is available for use by the FORMATDS command and re-invoke the FORMATDS command. Refer to *OS/390 TSO/E Command Refer-*

ence for a description of the ALLOCATE command if the error message indicated that the dataset could not be allocated. If the message indicated that an unknown error occurred, contact your system administrator.

BFSxx1615E Error occurred reading the volume list dataset. EXECIO return code *return-code***.**

Explanation: An error was encountered while reading the volume list dataset. The EXECIO return code has been indicated in the command. If the return code was 20 then an EXECIO error message is also presented.

Source: LAN Server

System Action: Processing ends.

User Response: Refer to *OS/390 TSO/E REXX Reference* for a description of the EXECIO error. Contact your system administrator.

BFSxx1616E Invalid volume serial in volume list.

Explanation: An invalid volume serial identifier is specified in the volume list. (For example, a volume serial that was more than 6 characters).

Source: LAN Server

System Action: Processing ends.

User Response: Re-invoke FORMATDS command with valid volume serials.

BFSxx1617E Duplicate volume serial found in volume list.

Explanation: Duplicate volume serials is specified in the volume list. Members of striped datasets MUST reside on separate DASD volumes; hence, duplicate volume serials in the volume list is disallowed.

Source: LAN Server

System Action: Processing ends.

User Response: Re-invoke FORMATDS command without duplicate volume serials in the volume list.

BFSxx1618E Striped dataset size specified is smaller than the minimum size allowed per DASD volume. or **Striped dataset size specified is larger than the maximum size allowed per DASD volume.**

Explanation: A dataset size is specified that results in the members of the striped datasets having a size too large or too small, or the user specified the MAX size option and one of the DASD volumes in the user volume list did not have enough contiguous space to contain one of the members of the striped dataset.

Source: LAN Server

System Action: Processing ends.

User Response: The minimum size for each member of a striped dataset size is the maximum of 256 and the blocking factor. The maximum size for each dataset is 4G assuming a DASD volume of the given type can support a dataset that size. Otherwise the maximum size is determined by the maximum size dataset that can be allocated on one volume. Specify a size that results in the size of the members of the striped dataset to fall within this range. Ensure that there is enough contiguous space on each DASD volume to contain the members of the striped dataset. Consider using the MAX size option of FORMATDS, this allows FORMATDS to allocate the maximum size dataset that will fit on each DASD volume.

BFSxx1619I Requested striped dataset size is *size* **4K blocks.** or **Requested maximum striped dataset size.**

Explanation: This is an informational message that indicates the requested number of 4K blocks.

Source: LAN Server

System Action: Processing continues.

User Response: None required.

BFSxx1620I Actual striped dataset size to be formatted is *size* **4K blocks.**

Explanation: The size of a striped dataset must be a multiple of the number of volumes and each member of the striped dataset must be a multiple of the blocking factor. Thus rounding may occur when determining the overall size to format. If any rounding of the dataset size was made to accommodate this, or the MAX size option was specified, this message is issued to indicate that actual size of the dataset that was formatted.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1621E MAX striped dataset size cannot be requested when members of the striped dataset have been pre-allocated.

Explanation: The MAX size option is used to ensure that FORMATDS allocates the members of the striped dataset as large as possible. With this option, FORMATDS will ensure that each member of the striped set is no bigger than the minimum of the maximum amount of contiguous space on each volume. To allow FORMATDS to do this effectively, pre-allocation of the members of the striped dataset is not allowed.

Source: LAN Server

System Action: Processing ends.

User Response: Either issue the FORMATDS with a size specified that represents the cumulative total of the pre-allocated datasets or delete the datasets that are pre-allocated and re-issue FORMATDS with the MAX size option.

BFSxx1622I The current bandwidth setting for *dsname* **is** *bw* **KB/s.**

Explanation: This message displays the current bandwidth setting, *bw*, for the dataset *dsname*, in kilobytes per second.

Source: LAN Server

System Action: The bandwidth of a dataset is a measure of the rate at which data can be read from or written to the dataset. The current bandwidth setting, *bw*, for a given dataset is a threshold value that is used to determine how many video streams can be read from the dataset concurrently without impacting the file server host program's ability to deliver those video streams at the required data rates.

User Response: No action is required. Administrator commands can be used to query or change the current bandwidth setting for a dataset.

BFSxx1623I The calibrated bandwidth capacity for *dsname* **is** *bw* **KB/s.**

Explanation: This message is displayed after the file server host program has run a calibration test against the indicated dataset, *dsname*, and shows the measured bandwidth, *bw* of the dataset, in kilobytes per second.

Source: LAN Server

System Action: The bandwidth of a dataset is a measure of the rate at which data can be read from or written to the dataset. The current bandwidth setting, *bw*, for a given dataset is a threshold value that is used to determine how many video streams can be read from the dataset concurrently without impacting the file server host program's ability to deliver those video streams at the required data rates. This message shows the bandwidth that is possible for the dataset, not necessarily the current bandwidth that is in effect for the dataset.

User Response: No action is required. Administrator commands can be used to query or change the current bandwidth setting for a dataset.

BFSxx1624I Formatting dataset *name* or **Format ended with errors for** *name* or **Format complete for** *name*

Explanation: These messages display the status of the format for the dataset. Note that message versions 2 and 3 are only output if the dataset being formatted is striped and this is the first time the dataset has been formatted (which takes some time).

Source: LAN Server

System Action: Processing continues.

User Response: If message version 2 is displayed, additional error messages will be presented.

BFSxx1625W Members of striped dataset found on different DASD types.

Explanation: Members of a striped dataset should reside on the same type of DASD for optimal performance.

Source: LAN Server

System Action: Processing continues.

User Response: If the intent is to place the members of the striped dataset on different DASD types then no action is required. Otherwise, re-invoke FORMATDS ensuring all DASD volumes that contain the striped dataset are the same type.

BFSxx1626E Unexpected error locating the cluster data component name of dataset - *name* or **Unexpected error locating the cluster data component name of dataset -** *name* **CSI return code** *return-code***, reason code** *reason***.**

Explanation: An error occurred while trying to determine the dataset name of the data component for the member of striped dataset - *name*. At this point in FORMATDS processing, all members of the striped dataset should have been defined (either by invocation or by FORMATDS).

Source: LAN Server

System Action: Processing ends.

User Response: Check to see if all the members of the striped dataset have been defined as VSAM linear datasets. Re-invoke FORMATDS (which will attempt to define any members of the striped dataset not presently defined). If the CSI return code is 8, and the reason code is 1, then there is not enough storage to process the command, re-invoke FORMATDS with a larger storage size. If the CSI return code is 4, then the reason code supplied has the format: 1 byte return code followed by a 1 byte reason code. These reason codes and return codes are documented in *OS/390 MVS System Messages, Vol 4 (IEC-IFD)* under message IDC3009I. Refer to this book for a description of a particular return and reason code. If any other CSI return code is presented, contact your system administrator.

BFSxx1627E Volume *volser* **not mounted.**

Explanation: A UCBSCAN for the volume serial *volser* failed. It is assumed that the volume doesn't exist or is not mounted.

Source: LAN Server

System Action: Processing ends.

User Response: Check to see if they provided a volume serial for a volume that does not exist or is not mounted. If the volume does exist and is mounted then contact your system administrator, otherwise provide a valid volume serial and re-invoke FORMATDS.

BFSxx1628E Asset not found. or **Asset object for asset** *asset#* **not found. Processing continues.**

Explanation: A request was made to remove an object that does not exist. For the REMOVE command, the asset name is output on a subsequent line.

Source: LAN Server

System Action: Processing ends for REMOVE command.

User Response: None required, the object already doesn't exist.

BFSxx1629E Asset is currently in use.

Explanation: A request was made to remove an asset from the file server host program that is currently in use. The asset name will be displayed on a subsequent line.

Source: LAN Server

System Action: Processing ends.

User Response: Re-invoke the REMOVE command when the asset is no longer in use.

BFSxx1630E The FORMATDS MAX size function not supported for this release of MVS/DFP.

Explanation: The MAX size option is only supported on MVS/DFP Version 3 Release 3 or later releases.

Source: LAN Server

System Action: Processing ends.

User Response: Re-invoke FORMATDS specifying the dataset size.

BFSxx1631E Error occurred during *command* **processing.**

Explanation: An error has occurred that prevented the *command* command from completing. Additional messages may be issued to indicate the type of error that occurred.

Source: LAN Server

System Action: Processing ends.

User Response: If additional messages are provided, refer to those messages for the appropriate action to take. If no additional messages are provided then contact your system administrator.

BFSxx1632I Asset removed successfully.

Explanation: The REMOVE command has successfully deleted the asset from the system. The asset name follows in a subsequent line.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1633I *command* **has started.**

Explanation: The *command* has started.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1634E Member of striped dataset - *name* **is allocated on multiple volumes.**

Explanation: The member of the striped dataset - *name* is allocated on more than one DASD volume.

Source: LAN Server

System Action: Processing ends.

User Response: Members of striped datasets are not allowed to be allocated on more than one DASD volume. Re-allocate the member of the striped dataset on only one volume and re-invoke FORMATDS.

BFSxx1663I VSAM volume dataset - *name* **allocated on volume** *volser***.**

Explanation: FORMATDS has successfully allocated the VSAM volume dataset on the indicated volume. This dataset must exist on the volume before FORMATDS can define any linear datasets on it.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1664I Update bandwidth less than allocated BW for LFSDSN: *dsname* **The command is rejected.**

Explanation: LAN Server was unable to update the bandwidth associated with the LFSDSN *dsname*. The new update bandwidth is less than the allocated bandwidth. Update is not allowed.

Source: LAN Server

System Action: The bandwidth previously set for the specified LFSDSN remains unchanged.

User Response: Update bandwidth must be not less than the allocated bandwidth.

BFSxx1665E Error initializing the LAN Server resource manager.

Explanation: The file server host program was unable to perform resource manager initialization during start-up. The probable cause is insufficient virtual storage to allocate resource manager tables.

Source: LAN Server

System Action: The file server host program terminates, since the resource manager could not be initialized.

User Response: Increase the region size for the file server and restart. If the problem persists, contact your IBM support personnel.

BFSxx1666E Error defining LFSDSN *dsname* **to the file server host program resource manager.**

Explanation: The file server host program was unable to define the LFSDSN, *dsname* to the resource manager. The problem may be caused by insufficient virtual storage to extend the resource manager tables or, if the file is a meta resource FASTBUFS may not be defined in the CONFIG configuration file. FASTBUFS is required for meta resources.

Source: LAN Server

System Action: The LFSDSN will remain undefined to the file server, since it could not be added to the resource manager tables.

User Response: Increase the region size of the file server host program or define FASTBUFS in the CONFIG configuration file. Stop and then restart the file server host program. If the problem persists, contact your IBM support personnel.

BFSxx1667E Error updating the bandwidth for LFSDSN: *dsname*

Explanation: The file server host program was unable to update the bandwidth associated with the LFSDSN *dsname*. Errors of this nature normal indicate an internal error in the resource manager.

Source: LAN Server

System Action: The bandwidth previously set for the specified LFSDSN remains unchanged.

User Response: Contact your IBM support personnel.

BFSxx1668E Error calibrating the bandwidth for LFSDSN: *dsname*

Explanation: The file server host program was unable to calculate the bandwidth of LFSDSN *dsname*, because an error occurred running the bandwidth calibrator.

Source: LAN Server

System Action: The bandwidth previously set for the specified LFSDSN remains unchanged.

User Response: Contact your IBM support personnel.

BFSxx1669E Error accessing the video metafile LFSDSN.

Explanation: While attempting to process a video-related command, the file server host program was unable to access the LFSDSN containing the video metafiles. This can be caused by any one of the following conditions:

- No LFSDSN of type META was defined by either a LFSDSN record in the CONFIG configuration or by the LFSDSN command
- The metafile LFSDSN has not been properly formatted with the FORMATDS command
- The metafile LFSDSN is accessed READ-ONLY
- the file server host program is not authorized to access the metafile LFSDSN
- The metafile LFSDSN is already being accessed, causing a dataset sharing conflict

Source: LAN Server

System Action: The video-related command terminates.

User Response: Determine and correct the cause of the access failure and reissue the video-related command.

BFSxx1670E The LINK subchannel pair count, *count*, is invalid.

Explanation: The subchannel pair count, *count*, is invalid. This *count* must be in the range 0..15.

Source: LAN Server

System Action: The LINK record containing the invalid *count* parameter is not processed. The file server host program start up processing continues.

User Response: Correct the *count* parameter on the LINK record. Shutdown the file server host program and restart.

BFSxx1671E Source file is an existing directory. or **Source file is a root directory.**

Explanation: Only a directory was specified as input to the command. A metafile file name is required.

Source: LAN Server

System Action: None.

User Response: Reissue the command with the metafile file name specified.

BFSxx1672E Can not open the file on the META disk. or **Can not read the file on the META disk.**

Explanation: An internal error occurred attempting to perform a metafile operation.

Source: LAN Server

System Action: None.

User Response: Contact your IBM Service Representative.

BFSxx1673E The specified operation cannot be performed against the specified type of dataset or **The specified operation cannot be performed against a META dataset** or **The specified operation cannot be performed against a VIDEO dataset**

Explanation: The file server host program command cannot be issued against the specified type of dataset.

Source: LAN Server

System Action: Processing of the command ends.

User Response: None.

BFSxx1674E Invalid metafile or asset name: *metaname*

Explanation: The *metaname* specified on the LAN Server administration command is not a valid metafile or asset name.

If the metafile or asset name is 50 characters long or less, the entire name is shown in the error message. Otherwise, the metafile or asset name will be truncated.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid metafile or asset name.

BFSxx1675E Invalid community name: *commname*

Explanation: The *commname* specified on the LAN Server administration command is not a valid community name.

If the community name is 50 characters long or less, the entire name is shown in the error message. Otherwise, the community name will be truncated.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid community name.

BFSxx1676W Invalid bandwidth value: *bandwdth*

Explanation: The *bandwdth* specified on the file server host program CONFIG record is not within the valid bandwidth range.

If the bandwidth value is 50 characters long or less, the entire value is shown in the error message. Otherwise, the bandwidth value will be truncated.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1677E Value for number of viewers is invalid or missing.

Explanation: The value provided for number of viewers was not in the correct range or was missing.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Specify a value for the number of viewers in the range 1 to 9999.

BFSxx1678E QOS attributes for source file not found.

Explanation: Original file on PWS LFSDSN does not contain Quality of Service Extended Attributes.

Source: LAN Server

System Action: Processing of the command ends.

User Response: OS/2 user can use the LAN Server Ultimedia QOSEA tool to set the Extended Attributes for the source file residing on the PWS disk.

BFSxx1679E Error creating file on *dsname* dataset. or **Error opening file on *dsname* dataset.** or **Error reading file on *dsname* dataset.** or **Error writing file on *dsname* dataset.** or **Error closing file on *dsname* dataset.** or **Error erasing file on *dsname* dataset.**

Explanation: An error occurred while attempting to process a file on a LFSDSN.

Source: LAN Server

System Action: For INPUT, processing of the command ends. For VIEWERS, processing may continue, depending on the disk on which the error occurred.

User Response: None.

BFSxx1680E Sufficient system resources are not available to satisfy the request.

Explanation: An attempt to reserve system resources through the file server host program resource manager for this request was unsuccessful.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Determine the current usage of system resources and free or add resources as necessary to complete this request. Use the QUERY VIDEODSN command to determine each disk with enough available free space to contain a single copy of the asset. If one or more such disks exist then this would indicate that there is a shortage of planned bandwidth on these disks to load the asset. This means that this asset requires additional disk(s) large enough to load a single copy of the asset. Perform one or more of the following:

- Use the REMOVE command to remove an existing asset, thereby freeing up planned bandwidth and disk space.
- Use the VIEWERS command to reduce the number of expected viewers for an existing asset, thereby freeing up planned bandwidth and possibly freeing up disk space used by one or more copies of the asset being deleted.

If these actions can not be taken, then another VIDEO LFSDSN large enough to load a single copy of the asset should be added to the system.

BFSxx1681E Nonfatal error occurred during *command* **processing.**

Explanation: A nonfatal error has occurred while processing the *command* command. Additional messages may be issued to indicate the type of error that occurred.

Source: LAN Server

System Action: Processing continues.

User Response: If additional messages are provided, refer to those messages for the appropriate action to take.

BFSxx1683E VIEWERS 0 is not allowed.

Explanation: Unable to set viewer count to zero, viewer count must be greater than 0 and less than 10,000.

Source: LAN Server

System Action: Processing ends.

User Response: Select a viewer value between 0 and 10,000.

BFSxx1684E File is currently being modified.

Explanation: The VIEWERS command cannot be invoked against an asset which is already being processed by 'INPUT' or 'VIEWERS' commands.

Source: LAN Server

System Action: Processing ends.

User Response: None.

BFSxx1685I Expected viewer value is unchanged. or **Expected viewer value is now** *number***.**

Explanation: The viewer value has either been set to the value displayed in the message, or was not been changed and remains the same. The value was unchanged because of errors encountered.

Source: LAN Server

System Action: Processing ends.

User Response: None.

BFSxx1686E Unable to open file for replication.

Explanation: An error occurred while trying to open the copy file used for reading.

Source: LAN Server

System Action: Processing ends

User Response: None.

BFSxx1687E Invalid volume serial number specification: *volser*

Explanation: The specified volume serial number is not valid. It must be 1 to 6 characters in length. The valid characters are any alphanumeric character and special characters: #, @, $, -. For more information, see *OS/390 MVS JCL Reference*.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid *volser*.

BFSxx1688E Invalid unit device number specification: *unit*

Explanation: The specified unit device number or device name is not valid. It must be 3 to 8 characters in length. The valid characters are any alphanumeric character and special characters: #, @, $, - /. For more information, see *OS/390 MVS JCL Reference*.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid *unit*.

BFSxx1689E The name type of the specified dataset must be FOLD.

Explanation: META and VIDEO datasets must be FOLD. An LFSDSN cannot be defined for a META or VIDEO dataset if the type is not FOLD.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Use the SET ATTRIB command to change the format of the dataset or reformat the dataset using the FORMATDS command.

BFSxx1690E The format of a dataset cannot be changed while the file server host program is running.

Explanation: The format of a dataset cannot be changed using the LFSDSN command, it can only be changed in the CONFIG file. The format cannot be changed while the file server is running.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Change the appropriate LFSDSN records in the CONFIG file. Shutdown the file server host program and restart.

BFSxx1691E The file server host program could not be started because VIDEO was specified but FASTBUFS were not defined.

Explanation: VIDEO ON was specified in the CONFIG file, however no FASTBUFS were defined in the CONFIG file.

Source: LAN Server

System Action: The file server terminates since VIDEO services could not be started.

User Response: Specify the FASTBUFS record in the CONFIG file and restart the file server host program.

BFSxx1692E Unable to start SNMP subagent task, error code = *posterr*.

Explanation: Unable to start up the SNMP subagent task due to error specified by the error code:

4 Failed to allocate control block. The SNMP subagent encountered an error when attempting to allocate control block storage.

10 Failed to initialize SNMP subagent. The SNMP subagent encountered an error when attempting to build the MIB tree.

11 Failed to contact Agent. The SNMP subagent encountered a catastrophic error when attempting to establish a communications path with the SNMP agent. Retry was not appropriate.

12 Failed to process SNMP message. The SNMP subagent encountered an error when trying to process an SNMP message.

100 General error. A general error was encountered by the SNMP subagent. No additional information is available.

Source: LAN Server

System Action: The file server host program terminates.

User Response: Correct error specified by the error code (if possible), and re-start the file server host program.

BFSxx1693E Error setting *setrtn* information in the SNMP subagent. or **Error setting FILE TRANSMISSION information in the SNMP subagent, function code = *fcncode*.**

Explanation: An error occurred when the file server host program invoked an SM_Set call to set information of the specific group in the SNMP subagent Management Information Block (MIB).

The specific groups being set in the MIB are:

- LFSDSN
- LINK
- ASSET
- ASSET COPY
- SERVER
- FILE TRANSMISSION

For FILE TRANSMISSION group, the function code indicates the specific function call that returns the error:

1 Add Connection Entry

2 Add File Entry

3 Delete File Entry

4 Delete Connection

5 Add File/Add Connection

6 Delete File/Add File

7 Delete File/Delete Connection

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1694E Error generating trap for *alert* by the SNMP subagent, trap *trapnum*.

Explanation: An error occurred when the file server host program invoked an Alert call to notify the SNMP subagent to generate a trap specified by the trap number. Detected alerts are:

Trap #1 Alert_VideoDisks_Capacity_Full

Trap #2 Alert_VideoDisks_Capacity_Full.Extended

Trap #3 Alert_Disk_Space_Full.Load

Trap #4 Alert_Disk_Space_Full.Replicate

Trap #5 Alert_Disk_Space_Full.Retrieve

Trap #6 Alert_Disk_ActualBW_Full

Trap #7 Alert_Disk_ActualBW_Full.Extended

Trap #8 Alert_Fast_Buffers_Full

Trap #9 Alert_Fast_Buffers_Full.Extended

Trap #10 Alert_Link_ActualBW_Full

Trap #11 Alert_Link_ActualBW_Full.Extended

Source: LAN Server

System Action: Processing continues.

User Response: Use information provided by the trap to determine what error condition has occurred.

BFSxx1695E SNMP support has terminated due to error.

Explanation: The SNMP subagent has terminated due to an error.

Source: LAN Server

System Action: Processing continues, but the SNMP support has terminated.

User Response: Shutdown and re-start the file server host program to start the SNMP support again.

BFSxx1696E Asset can not be created with a read throughput value of 0.

Explanation: The Quality Of Service Extended Attributes associated with the asset on tape or with the file located on the PWS disk has an invalid read throughput value of 0.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Specify a non-zero value for the read throughput for the asset on tape if attempting to use LOADTAPE or use the IBM Ultimedia QOSEA tool to set a non-zero read throughput value for the file located on the PWS disk if attempting to use the INPUT command.

BFSxx1702W The BFSBR options file is not valid, not available, or the options file characteristics are not supported.

Explanation: The BFSBR options file is not a valid dataset, cannot be accessed, or the file characteristics are not supported.

Source: LAN Server

System Action: Processing continues.

User Response: Define a BFSBR options file or specify the options file on the command line. If a BFSBR options file is defined, ensure that the logical record length does not exceed the maximum allowed.

BFSxx1704E Option file definition *'parm'* is not a valid parameter for the *option* option.

Explanation: The parameter *parm* on option *option* is not valid.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that the option for the parameter entered is correct.

BFSxx1705I No files or directories found.

Explanation: During processing of the INCREMENTAL backup request, either no workstation files or directories were found on the specified file server data set or none were found on the specified file server host program backup data set.

If there were no files or directories found on the file server data set, the workstation data contained in the corresponding backed up file server host program data set is marked inactive. If there were no files or directories found on the specified file server host program backup server data set, INCREMENTAL backup processing continues.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1706E The file server host program data set specification *dsname* is incorrect.

Explanation: The file server host program data set specification is not correct.

Source: LAN Server

System Action: Processing ends.

User Response: Correct the data set specification, and enter the LFSBR command again.

BFSxx1710E Insufficient storage to continue Backup/Restore processing on the TSO/E Administrator.

Explanation: The file server host program cannot allocate the necessary storage in the TSO/E Administrator logon to complete the processing of the INCREMENTAL or RESTORE request.

Source: LAN Server

System Action: None.

User Response: Check the storage requirements and increase the region size of the TSO/E logon of the file server host program administrator, if necessary.

If the maximum storage was defined for an INCREMENTAL backup request, define multiple INCREMENTAL backup requests, each specifying a different subdirectory of the large file server data set. INCLUDE/EXCLUDE statements may be used to filter files and directories that will or will not be backed up.

BFSxx1712E Directory separator is needed. Specification is *dsname*.

Explanation: A directory separator is required between *dsname* and *path*.

Source: LAN Server

System Action: Processing ends.

User Response: Enter the correct file server host program data set specification.

BFSxx1713E No wildcards allowed on directory or file specification for INCREMENTAL backup, or no wildcards allowed on source directory specification for RESTORE.

Explanation: The request for an INCREMENTAL backup or RESTORE contains a wildcard specification.

Source: LAN Server

System Action: Processing ends.

User Response: For an INCREMENTAL backup request, enter the request again with no wildcards specified.

For a RESTORE request, enter the request again with no wildcards specified in the source directory specification.

BFSxx1714E Path name too long, see specification limits for OS/2 or NFS.

Explanation: The path name exceeds the limit allowed for OS/2 or NFS.

Source: LAN Server

System Action: Processing ends.

User Response: Correct the name.

BFSxx1715E File name too long, see specification limits for OS/2 or NFS.

Explanation: The file name exceeds the limit allowed for OS/2 or NFS.

Source: LAN Server

System Action: Processing ends.

User Response: Correct the name.

BFSxx1721E Option syntax is incorrect or incomplete. Value *value* was found.

Explanation: An option in the options file or on the command is not in the correct syntax.

- Options entered on the command line that require values must begin with a minus sign (-), immediately followed by the option name, immediately followed by an equal sign (=), immediately followed by the option value.
- Options in the options file that require values do not need a minus sign (-) or equal sign (=), and are only followed by the option value.

Source: LAN Server

System Action: Processing ends.

User Response: Correct the syntax for the option in error and issue the LFSBR command again.

BFSxx1722E *parm* **is not a valid parameter for option** *option***.**

Explanation: The parameter *option* specified on the command line contains an incorrect parameter.

Source: LAN Server

System Action: Processing ends.

User Response: Enter the correct option and parameter.

BFSxx1725E Option *option* **specified on the command line is not valid.**

Explanation: A file server host program backup option was entered that is not supported or is not valid.

Source: LAN Server

System Action: Processing ends.

User Response: Enter the command again, specifying the correct option.

BFSxx1727E The size of the data for this file server host program INCREMENTAL backup request exceeds the maximum size allowed by the backup file server.

Explanation: The file server host program backup server defines the largest file that may be backed up. The size of this file exceeds the maximum value defined.

Source: LAN Server

System Action: Processing for this file ends. Backup processing continues.

User Response: Contact the administrator of the file server host program backup server.

If this file is not required to be backed up, the EXCLUDE statement may be used.

BFSxx1728E The file server host program cannot connect to the specified file server data set. Refer to the status log file for details.

Explanation: The file server host program cannot connect to the specified data set, and cannot read or write to any files on that data set.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that the correct file server data set is specified. See the Query status log file for more details for why the file server host program cannot connect to the data set.

BFSxx1729E The file server host program could not connect to data set *dsname***.**

Explanation: The file server host program could not use the specified data set for file serving.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that the data set exists, that it is a linear data set formatted by FORMATDS, and that the file server host program has security access to the data set.

BFSxx1731E The file server host program cannot retrieve all of the directory/file names from the file server data set. Check the status log file for details.

Explanation: The file server host program cannot query all of the directory and file names from the file server data set.

Source: LAN Server

System Action: Processing ends.

User Response: See the Query status log file for a more detailed explanation for why the failure occurred.

BFSxx1732E Attempt to establish a session with the file server host program backup server was rejected. No resources available on the file server host program backup server.

Explanation: No file server backup server resources are available. An attempt to establish a session with the file server host program backup server was rejected. The file server's backup server lacks resources to connect to the file server host program.

Source: LAN Server

System Action: The communications link not established.

User Response: Enter the command again. If the problem continues, see the system administrator of the file server host program backup server.

BFSxx1733E Unable to connect to the file server's backup server: Password has expired on the file server's backup server.

Explanation: The password for this node on the file server host program backup server has expired and the file server host program cannot connect to the file server's backup server.

Source: LAN Server

System Action: The communications link is not established. Processing ends.

User Response: Update the password for the file server's backup server node. This administration task may be done from a file server's backup server administrative client, a file server's backup server workstation client, or through the host MODIFY command issued to the file server host program backup server.

BFSxx1734E Unable to connect to the file server's backup server: Client ID (LFSBRNODE) is unknown.

Explanation: No file server host program backup server client ID (node) is indicated in the file server's backup server.

Source: LAN Server

System Action: The communications link was not established. Processing ends.

User Response: Ensure that a valid client ID (LFSBRNODE) is defined.

BFSxx1735E The file server host program backup server session rejected: Duplicate client ID (LFSBRNODE) defined to the file server's backup server.

Explanation: There is a duplicate file server host program backup server client ID (LFSBRNODE) registered on the backup file server host program.

Source: LAN Server

System Action: The communications link was not established. Processing ends.

User Response: Ensure that there is a unique, valid client ID (LFSBRNODE) defined.

BFSxx1736E Unable to connect to the file server's backup server: Down level file server version.

Explanation: The file server's backup server version and the file server code for Backup/Restore do not match.

Source: LAN Server

System Action: Processing ends.

User Response: Ask your file server host program backup administrator what version of file server host program backup server code you must be running for your location. This must match the version being run on the file server host program.

BFSxx1737E Unable to connect to the file server's backup server: Down level file server client code version.

Explanation: The file server host program backup server version and the file server host code do not match.

Source: LAN Server

System Action: Processing ends.

User Response: Ask your file server host program backup server system administrator what version of file server host program backup server code you should be running for your location. This must match the version being run on the file server host program.

BFSxx1738E Unable to connect to the file server's backup server: Client (LFSBRNODE) type mismatch.

Explanation: The node ID (LFSBRNODE) must be registered as a file server node type.

Source: LAN Server

System Action: The communications link was not established. Processing ends.

User Response: Define a new file server host program backup server node. This administration task may be done from a file server's backup server administrative client, a file server's backup server workstation client, or through the host MODIFY command issued to the file server host program backup server started task.

BFSxx1739E Unable to connect to the file server's backup server: The file server host program backup server is disabled.

Explanation: The file server host program backup server was disabled.

Source: LAN Server

System Action: The communications link was not established. Processing ends.

User Response: Contact the system administrator for status of the file server's backup server host program.

BFSxx1740E Unable to connect to the file server's backup server: Authentication failure.

Explanation: The file server host program backup server password entered is incorrect.

Source: LAN Server

System Action: Processing ends.

User Response: Enter the correct password again on the command line or in the BFSBR Options File. New passwords may be assigned by the file server host program backup server administrator.

BFSxx1741E Unable to connect to the file server's backup server: Communications protocol error.

Explanation: An unexpected communications message was received by the file server host program.

Source: LAN Server

System Action: Processing ends.

User Response: Verify that the communications link is operating correctly. Refer to the status log for additional information. If the condition continues, contact your IBM representative.

BFSxx1742E Unable to connect to the file server's backup server: The file server host program backup file server is not available.

Explanation: The file server's backup server cannot be accessed at this time.

Source: LAN Server

System Action: Processing ends.

User Response: Try the operation again. If the file server host program backup server continues to be unavailable, have your file server host program backup server administrator ensure that the file server is operating correctly.

BFSxx1743E The communications path between the file server host program and the file server's backup server is not available.

Explanation: An APPC/VTAM error occurred between the file server and the file server's backup server. Events such as server outages and communication controller outages may cause this error to occur.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that the file server host program backup server is operational.

BFSxx1744E The specified file space is not known to the file server's backup server.

Explanation: The file space specified is not valid or does not exist on the file server host program backup server.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure that the *source* (or the *target* data set, if applicable) is specified correctly.

BFSxx1746I Data off-line, waiting for tape to be mounted.

Explanation: The file to be restored is off-line, or if the file is to be backed up, the file server host program backup server requires that this data is written to tape. The tape must be mounted by the file server's backup administrator. Processing will continue when the tape is mounted. The request will be automatically canceled by the file server's backup server, if a defined mount retention time has expired.

Source: LAN Server

System Action: Processing continues.

User Response: None.

BFSxx1747E Tape mount stopped by the file server host program backup server.

Explanation: The file was not restored.

Source: LAN Server

System Action: The file server's backup server stopped the tape mount.

User Response: Contact the system operator to see if a tape was mounted at the time of the restore. If a tape mount was performed, contact the file server host program backup administrator.

BFSxx1748I Retrying the operation with the file server host program backup server.

Explanation: The file server's backup server or file server's server requested that the file or directory be tried again.

Source: LAN Server

System Action: The file server host program backup server found a problem writing data to the repository. The operation is retried so that data can be written to a new location.

The file server host program may request the data be retried if a file cannot be sent compressed. In this case, the file is sent to the file server's backup server uncompressed.

User Response: If it is a file server's backup server repository problem, contact the file server host program backup server administrator.

BFSxx1749E Destination path must exist on RESTORE.

Explanation: The destination path must exist on RESTORE.

Source: LAN Server

System Action: Processing ends.

User Response: Specify an existing path for the RESTORE command.

BFSxx1750E The file server host program backup server repository ran out of storage.

Explanation: The file server's backup server ran out of repository space.

Source: LAN Server

System Action: Processing for this file ends. Backup processing continues.

User Response: Inform the file server host program backup server administrator that the file server's backup server backup repository ran run out of storage.

BFSxx1751E The actual amount of data exceeds the estimated size sent to the file server's backup server.

Explanation: The file or directory increased while it was being backed up.

Source: LAN Server

System Action: The file server host program backup server may retry the operation depending on the management class defined by the file server host program backup server administrator. Backup processing continues.

User Response: None.

BFSxx1752E Maximum number of retries with the file server's backup server was reached.

Explanation: The file server host program sends a request to the file server's backup server a specified number of times. This number was reached.

Source: LAN Server

System Action: If the limit is exceeded for a tape request, the entire operation is stopped.

For retries other than tape, the operation is stopped for the specified file or directory, and processing continues.

User Response: If the file server's backup server was required to mount a tape, the system operator (or the file server's backup backup mount exit routine) must respond to the tape request in the time specified by the file server's backup server.

If there is a file server backup repository problem for the file or directory specified, contact the file server host program backup server administrator.

BFSxx1756E LAN Server cannot connect the destination data set on RESTORE.

Explanation: The destination file server host program data set is not defined.

Source: LAN Server

System Action: Processing ends.

User Response: See the status log file for more information. Ensure that the destination data set is valid.

BFSxx1757E The *option* option is required.

Explanation: The *option* option is required for the LFSBR command.

Source: LAN Server

System Action: Processing ends.

User Response: Specify the *option* option and rerun.

BFSxx1758W Unable to open DD SYSTRACE for writing trace data. Output is directed to SYSOUT=*.

Explanation: The program was not able to open the SYSTRACE DD for writing trace information.

Source: LAN Server

System Action: Processing continues with trace output directed to SYSOUT=*.

User Response: If trace output is to be written to a data set, create a valid SYSTRACE DD in the task JCL. If a SYSTRACE DD is already defined, ensure that the data set name is correctly specified, and that the task has write authorization to the specified data set.

If a valid SYSTRACE DD name was used in the task JCL with the FREE=CLOSE option, a TRACE SYS PRT OFF administration command will release the DD name immediately. Additional TRACE SYS PRT ON commands will try to write to the SYSTRACE DD and this message will be issued.

BFSxx1770E The INCLUDE or EXCLUDE statement has a pattern that is too complex.

Explanation: The INCLUDE or EXCLUDE statement entered is too complex to be processed.

Source: LAN Server

System Action: Processing ends.

User Response: Enter the INCLUDE or EXCLUDE statement as shown in one of the examples.

BFSxx1771E The INCLUDE or EXCLUDE statement has no closing bracket.

Explanation: The INCLUDE or EXCLUDE pattern was entered incorrectly.

Source: LAN Server

System Action: Processing ends.

User Response: Correct the syntax for the pattern.

BFSxx1772E The INCLUDE or EXCLUDE statement must start with a directory delimiter.

Explanation: The INCLUDE or EXCLUDE pattern was entered incorrectly.

Source: LAN Server

System Action: Processing ends.

User Response: Correct the syntax for the pattern.

BFSxx1773E The INCLUDE or EXCLUDE pattern has a '...' without beginning or ending directory delimiter.

Explanation: The INCLUDE or EXCLUDE pattern was entered incorrectly.

Source: LAN Server

System Action: Processing ends.

User Response: Correct the syntax for the pattern.

BFSxx1774E Communications error between the file server host program and the file server's backup server.

Explanation: An unexpected communications error occurred. Server outages may cause this error.

Source: LAN Server

System Action: Processing ends.

User Response: Verify that communications are active between the file server's backup server and the file server host program.

BFSxx1791E An unexpected file server host program error has occurred.

Explanation: The file server host program was unable to process the entire LFSBR request or administration command due to an unexpected file server host program detected error.

Source: LAN Server

System Action: If the file server host program was querying a file server data set or a file server's backup server backup repository to prepare for an INCREMENTAL backup, processing ends. An additional message is sent to the file server host program administrator telling where in the querying process the failure occurred.

If the file server host program was processing an INCREMENTAL backup or RESTORE request, processing continues with the next file.

For any other command, processing ends.

User Response: If the command entered was a BACKUP or RESTORE request, use the file server TRACE command from the file server and the TRACEFLAGS option in the BFSBR Options file to collect trace data that can be used by system support personnel to diagnose the problem. For any other request, use the file server TRACE command from the file server host program to obtain more information about the problem.

BFSxx1792E An unexpected file server host program file system error has occurred.

Explanation: The file server host program was unable to process the entire LFSBR request or administration command due to an unexpected file server host program file system error.

Source: LAN Server

System Action: If the file server was querying a file server data set or a file server's backup server backup repository to prepare for an INCREMENTAL backup, processing ends. An additional message is sent to the the file server host program administrator telling where in the querying process the failure occurred.

If the file server host program was processing an INCREMENTAL backup or RESTORE request, processing continues with the next file. If the file server host program was processing an administration request, then processing of the request ends and no further system action is taken.

User Response: If the command entered was a BACKUP or RESTORE request, use the file server's TRACE command from the file server host program and the TRACEFLAGS option in the BFSBR Options file to collect trace data that can be used by system support personnel to diagnose the problem. For any other request, use the TRACE command from the file server host program to obtain more information about the problem.

BFSxx1793E An unexpected file server host program server error has occurred.

Explanation: The file server host program was unable to process the entire LFSBR request or administration command due to a file server error.

Source: LAN Server

System Action: If the file server was querying a data set or a file server's backup server backup repository to prepare for an INCREMENTAL backup, processing ends. An additional message is sent to the file server host program administrator telling where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, processing continues with the next file.

For any other command, processing ends.

User Response: If the command entered was a BACKUP or RESTORE request, use the TRACE command from the file server and the TRACEFLAGS option in the BFSBR Options file to collect trace data that can be used by system support personnel to diagnose the problem. For any other request, use the TRACE command from the file server to obtain more information about the problem.

BFSxx1794E A hardware error was detected by the file server host program.

Explanation: The file server host program was unable to process the entire LFSBR request or administration command due to a hardware error.

Source: LAN Server

System Action: If the file server was querying a data set or a file server's backup server backup repository to prepare for an INCREMENTAL backup, processing ends. An additional message is sent to the file server host program administrator telling where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, processing continues with the next file.

For any other command, processing ends.

User Response: If the command entered was a BACKUP or RESTORE request, use the TRACE command from the file server and the TRACEFLAGS option in the BFSBR Options file to collect trace data that can be used by system support personnel to diagnose the problem. For any other request, use the TRACE command from the file server to obtain more information about the problem.

BFSxx1795E An error has occurred while processing a file server host program backup or restore request.

Explanation: The file server was unable to process the entire LFSBR request due to an error processing data from the file server's backup server.

Source: LAN Server

System Action: Processing ends.

User Response: Ensure both the file server host program and the file server's backup server are operational. Enter the request again, using the TRACE command from the file server, the TRACE command from the file server's backup server, and the TRACEFLAGS option in the BFSBR options file to collect trace data that can be used by system support personnel to diagnose the problem.

BFSxx1796E A file server host program function was requested that is not valid.

Explanation: The file server host program was unable to process the entire LFSBR request because a file server function was requested that is not valid.

Source: LAN Server

System Action: If the file server was querying a data set or a file server's backup server backup repository to prepare for an INCREMENTAL backup, processing ends. An additional message is sent to the file server host program administrator to tell where the querying process failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, processing continues with the next file.

User Response: Enter the request again, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data that can be used by system support personnel to diagnose the problem.

BFSxx1797E The file server host program cannot find the specified file or directory.

Explanation: The file server was unable to process the entire LFSBR request because it could not find the specified file or directory. Either the file has been deleted or the file contains invalid characters.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Locate the file name that appears just prior to the error message in the status log file. Try listing the contents of the directory from your workstation (using the DIR command from an OS/2 client or the file server command from an NFS client) to see if the file or directory exists on the data set. If the file or directory does exist, try to edit it from the OS/2 requester. If you cannot edit it, the file name may contain characters that are not valid for the file server's data set. If you can edit it, then enter the LFSBR request again, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data that can be used by system support personnel to diagnose the problem.

BFSxx1798E The file server host program cannot find the specified path.

Explanation: The file server host program was unable to process the entire LFSBR request because it cannot find the specified path. Either the path does not exist or it was deleted.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Locate the path name or the path of the file just prior to the error message in the status log file. Try issuing a DIR command from an OS/2 client or a file server command from an NFS client on this path to see if it exists on the file server's data set. If it does exist, then enter the LFSBR request again, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data that can be used by system support personnel to diagnose the problem.

BFSxx1799E The file server host program will not allow access to the specified file or directory.

Explanation: The file server host program was unable to process the entire LFSBR request because it cannot access the specified file or directory. A file server user may be accessing the file and have it locked.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Enter the request again when the file server user is no longer using the file. If the request fails, then enter the request again, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data that can be used by system support personnel to diagnose the problem.

BFSxx1800E The file server host program detected an incorrect internal file handle.

Explanation: The file server host program was unable to process the entire LFSBR request because it detected an internal file handle that is not valid.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Enter the request again, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1801E The file server host program does not have enough available storage to process the command.

Explanation: The file server host program was unable to process the entire request because it did not have enough available virtual storage.

Source: LAN Server

System Action: If the file server was querying a data set or a file server's backup server repository to prepare for an INCREMENTAL backup request, processing ends. An additional message is sent to the file server host program administrator telling where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, processing continues with the next file.

User Response: Check the storage requirements and increase the region size of the file server host program and enter the request again.

If the file server was processing an INCREMENTAL backup or RESTORE request and the maximum region size was defined, try defining multiple INCREMENTAL backup or RESTORE requests, each specifying a different subdirectory of the large file server or the file server's backup server repository. For an INCREMENTAL backup request, INCLUDE/EXCLUDE statements may be used to filter files and directories that will or will not be backed up.

BFSxx1802E The file server host program detected an incorrect storage block address during processing.

Explanation: While the file server host program was processing a request, an incorrect internal storage block address was detected.

Source: LAN Server

System Action: If the file server was querying a data set or a file server's backup server backup repository to prepare for an INCREMENTAL backup request, then processing ends. An additional message is sent to the file server host program administrator to tell where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, then processing continues with the next file.

User Response: Enter the request again, using the TRACE command on the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1803E The file server host program cannot find the specified data set.

Explanation: The file server either does not have the data set information listed on an LFSDSN record in the CONFIG configuration file or an error occurred while attempting to find the data set.

Source: LAN Server

System Action: Processing ends.

User Response: If not defined to the file server, use the LFSDSN command to dynamically add the data set to the list of those which the file server host program can access. Reenter the command. If successful, add an LFSDSN record for this data set to the CONFIG configuration file. If the LFSDSN information was already provided, reenter the command, using the TRACE command issued to a file server to collect trace data to be used in diagnosing the problem.

BFSxx1804E The file server host program cannot grant access to the file because it is being accessed by another process.

Explanation: The file server host program was unable to process the entire LFSBR request because it cannot access the specified file or directory. Another user may be accessing the file and have it locked.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: When the file is no longer in use, retry the request. If the request fails, then enter request again, using the TRACE command issued to the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1805E The file or directory already exists on the file server data set. or **The directory already exists on the file server data set.**

Explanation: The file or directory specified on the request is already on the specified data set.

Source: LAN Server

System Action: No action is taken and processing of the request ends.

User Response: Enter the request again, using a different name, or after renaming or erasing the existing file or directory.

BFSxx1806E The file server host program detected an incorrect parameter.

Explanation: The file server host program was unable to process the entire LFSBR request because it received an internal parameter that is not valid.

Source: LAN Server

System Action: If the file server was querying a data set or a file server's backup server backup repository to prepare for an INCREMENTAL backup request, then processing ends. An additional message is sent to the file server host program administrator indicating where in the querying process the failure occurred. If the file server was processing an INCREMENTAL backup or RESTORE request, then processing continues with the next file.

User Response: Enter the request again, using the TRACE command issued to the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1807E There is not enough space on the file server's data set.

Explanation: There is not enough space on the file server's data set to process the command.

Source: LAN Server

System Action: For the RESTORE request, processing continues with the next file or directory in the RESTORE list. For LFSCMD requests, processing ends.

User Response: Erase some files on the file server's data set from your workstation and try the request again, or direct the request to another file server defined data set.

BFSxx1808E The file name contains a character that is not valid for the file server's data set.

Explanation: The file name contains an HPFS character that is not valid. Since the file server's data set is in workstation format, all of the characters in the name must be valid in HPFS.

Source: LAN Server

System Action: Processing continues with the next file or directory in the RESTORE list.

User Response: Restore the file to the file server's data set with a different name.

BFSxx1810E The file server host program detected an incorrect extended attribute name.

Explanation: The file being processed contains an extended attribute name that is not valid. Data on the file server's data set or in the file server's backup server backup repository may be damaged.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Correct the extended attribute name from OS/2 and enter the request again. If you cannot, contact your system support personnel.

BFSxx1811E The file server host program detected an incorrect extended attribute list.

Explanation: The file being processed contains an extended attribute list that is not valid. Data on the file server's data set or in the file server's backup server backup repository may be damaged.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Correct the extended attribute list from OS/2 and enter the request again. If not, contact your system support personnel.

BFSxx1812E The file server host program detected an extended attribute list that is too long.

Explanation: The file being processed contains an extended attribute list that is too long. Data on the file server's data set or in the file server's backup server backup repository may be damaged.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Correct the extended attribute list from OS/2 and enter the request again. If you cannot, contact your system support personnel.

BFSxx1813E The extended attributes did not fit into the file on the file server's data set.

Explanation: The RESTORE request process cannot fit all of the extended attributes into the file on the file server's data set.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Try to restore the file to another file server defined data set.

BFSxx1814E The file on the file server's data set contains extended attributes that are not valid.

Explanation: The file being processed contains incorrect extended attributes. Data on the file server's data set or in the file server's backup server backup repository may be corrupted.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Correct the extended attributes from OS/2 and enter the request again. If you cannot, contact your system support personnel.

BFSxx1817E The file server host program detected an incorrect internal data set identifier.

Explanation: An internal error occurred within the file server host program regarding a data set identifier.

Source: LAN Server

System Action: If the file server was querying a file server's data set to prepare for an INCREMENTAL backup request, then processing enters. An additional message is sent to the file server host program administrator indicating where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, then processing continues with the next file.

User Response: Enter the request again, using the TRACE command issued to the file server, and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1818E The specified data set is unknown to the file server host program.

Explanation: The file server host program does not have any information about the particular data set. This information is given to the file server through an LFSDSN record in the CONFIG configuration file or an LFSCMD...LFSDSN command.

Source: LAN Server

System Action: Processing ends.

User Response: Use the LFSCMD...LFSDSN command to dynamically add the data set to the list of those that the file server can access Enter the LFSBR request again. If it is successful, add an LFSDSN record to the LFS CONFIG configuration file for this data set.

BFSxx1819E The file server host program has detected in internal error.

Explanation: The file server host program has encountered an internal error in processing the request.

Source: LAN Server

System Action: If the file server was querying a file server's data set to prepare for an INCREMENTAL backup request, then processing ends. An additional message is sent to the file server host program administrator to indicate where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, then processing continues with the next file.

User Response: Enter the request again, using the TRACE command issued to the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1820E There are no resources currently available on the file server host program to process the request.

Explanation: The file server host program was unable to process the entire LFSBR request because it did not have enough available resources.

Source: LAN Server

System Action: If the file server was querying a file server's data set or a file server's backup repository to prepare for an INCREMENTAL backup request, then processing ends. An additional message is sent to the file server host program administrator to indicate where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, then processing continues with the next file.

User Response: Check the storage requirements and increase the region size of the file server host program and enter the request again.

If the maximum region size was defined, try defining multiple INCREMENTAL backup or RESTORE requests, each specifying a different subdirectory of the large file server's data set the file server's backup server repository. For an INCREMENTAL backup request, INCLUDE/EXCLUDE statements may be used to filter files and directories that will or will not be backed up.

BFSxx1821E The file server's data set is not ready.

Explanation: The file server host program cannot read the file server's data set due to a problem with the data set.

Source: LAN Server

System Action: If the file server was querying a LAN Server data set to prepare for an INCREMENTAL backup request, then processing ends. An additional message is sent to the file server host program administrator to indicate where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, then processing continues with the next file.

User Response: Determine why the file server host program cannot read from the data set. Information for read or write access to a data set is given to the server through an LFSDSN record in the CONFIG configuration file or an LFSDSN command.

BFSxx1822E The file server's data set is not formatted properly. Format the data set using FORMATDS.

Explanation: The file server host program could not link to the data set because the data set is not formatted properly.

Source: LAN Server

System Action: Processing ends.

User Response: Format the data set using the FORMATDS command.

BFSxx1823E The file server host program detected a general hardware error.

Explanation: The file server host program detected a general error with some associated hardware.

Source: LAN Server

System Action: If the file server was querying a file server's data set to prepare for an INCREMENTAL backup request, then processing ends. An additional message is sent to the file server host program administrator to indicate where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, then processing continues with the next file.

User Response: Enter the request again, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1824E The OPEN for the file on the file server's data set conflicts because it is already open by another user.

Explanation: The file server host program was unable to process the entire LFSBR request because it cannot open the specified file. A user may be accessing the file and it is locked so that the administrator cannot access it.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list.

User Response: Enter the request again when the file is no longer in use. If the request fails, then enter the request again, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing problem.

BFSxx1825E An error occurred on a file server lock or unlock request.

Explanation: The file server host program was unable to process the entire request because it encountered an error on a lock or unlock request.

If this request was an administration request, then the administration request found a locking or unlocking problem while trying to satisfy your request.

Source: LAN Server

System Action: Processing continues with the next file or directory in the INCREMENTAL backup or RESTORE list. If an administration request was processing, then the processing of the request has ended and no further system action is taken.

User Response: Enter the request again, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1826E The communications send task on the file server host program is no longer available.

Explanation: The file server is no longer able to communicate with the file server host program administrator.

Source: LAN Server

System Action: If the file server was querying a file server's data set to prepare for an INCREMENTAL backup request, then processing ends. The status log file is sent to the file server host program administrator to indicate where in the querying process the failure occurred.

If the file server was processing an INCREMENTAL backup or RESTORE request, then processing continues with the next file. The status log file is sent when the INCREMENTAL backup or RESTORE request is complete.

User Response: None.

BFSxx1827E There is not enough storage for compression of the file during file server backup.

Explanation: There is not enough virtual storage in the file server host program to start the file compression routine.

Source: LAN Server

System Action: Processing for this file ends; backup processing continues.

User Response: Check the storage requirements and increase the region size of the file server host program, then enter the request again.

BFSxx1828E Error compressing file during the file server host program INCREMENTAL backup.

Explanation: An error occurred during file compression.

Source: LAN Server

System Action: Processing for this file ends; backup processing continues.

User Response: Enter the INCREMENTAL backup request again using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1829E File size increasing during file compression.

Explanation: The size of the file being compressed is increasing.

Source: LAN Server

System Action: The file is sent to the file server's backup server uncompressed. INCREMENTAL backup processing continues.

User Response: None.

BFSxx1831E A status log request resulted in an internal error. The INCREMENTAL backup request will continue. Status log information may be incorrect or incomplete. or **A status log request resulted in an internal error. The RESTORE request will continue. Status log information may be incorrect or incomplete.** or **A status log request resulted in an internal error. The QUERY command will continue. Status log information may be incorrect or incomplete.**

Explanation: While processing a status log request, an internal error was encountered.

Source: LAN Server

System Action: Processing of the INCREMENTAL backup or RESTORE request, or QUERY command will continue. The status log information will not be accurate.

User Response: Enter the request again. If the problem continues, contact your system support personnel to diagnose the problem.

BFSxx1832E The directory or file is not an active object on the file server's backup server.

Explanation: The directory or file is not defined in the file server's backup server backup repository.

Source: LAN Server

System Action: Processing for this file or directory ends.

User Response: Contact the file server host program backup administrator if this is a reoccurring message on the same file or directory.

BFSxx1833E Data read greater than expected file size.

Explanation: The number of bytes of file data read from the file is greater than the file size returned on the backup query request, with the COMPRESSION option set to OFF.

Source: LAN Server

System Action: Processing for this file ends; backup processing continues.

User Response: Enter the request again to back up the file in error, using the TRACE command from the file server and the TRACEFLAGS option in the BFSBR options file to collect trace data to assist in diagnosing the problem.

BFSxx1834E An INCREMENTAL backup or RESTORE request was entered for an object that had no data associated with it.

Explanation: For an INCREMENTAL backup request, an attempt may have been made to back up an empty directory.

For a RESTORE request, the object being restored had no file server backup data associated with it. The RESTORE request may have been entered in the middle of expiration processing on the file server's backup server.

Source: LAN Server

System Action: Processing for the file or directory ends.

User Response: For an INCREMENTAL backup request, check the file or directory to verify that data to be backed up exists.

For a RESTORE request, contact the file server host program backup administrator, if this is a reoccurring message on the same file or directory.

BFSxx1835I Querying the file server for directories and files.

Explanation: Obtaining a list of files and directories from the file server.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1836I Querying the file server's backup server for directories and files.

Explanation: Obtaining a list of files and directories on the file server's backup server.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1837I Starting INCREMENTAL backup for the file server's data set.

Explanation: Processing started for the INCREMENTAL backup request.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1838I Starting RESTORE for the file server's data set.

Explanation: Processing started for the RESTORE request.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1839I The file server is processing the RESTORE request. The RESTORE status log file is sent to user *admuser* **at** *admnode* **when the file server host program completes processing.**

Explanation: The file server host program processes the RESTORE request and returns the status log file when complete.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1840I Processing directories and files to build INCREMENTAL backup list.

Explanation: The file server host program administrator is building an INCREMENTAL backup list to send to the file server.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1841I INCREMENTAL backup list being sent to the file server for processing.

Explanation: The file server host program will process the INCREMENTAL backup list on the file server.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1842I The file server is processing the INCREMENTAL backup request. The INCREMENTAL backup status log file will be sent to user *admuser* **at** *admnode* **when processing completes.**

Explanation: The file server host program will process the INCREMENTAL backup list and return the status log file when complete.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1847I INCREMENTAL backup complete; no files or directories to back up.

Explanation: The files on the file server are the same as the files currently active on the file server's backup server, or they were excluded from the INCREMENTAL backup processing.

Source: LAN Server

System Action: INCREMENTAL backup processing ends.

User Response: Check the EXCLUDE and INCLUDE options specified on the command line or in the BFSBR options file to verify the correct pattern(s) for excluding.

BFSxx1849I Start RESTORE for the file server's backup node *nodename***.**

Explanation: The file server host program will restore data using the indicated node name supplied in the BFSBR options file or at the command line.

Source: LAN Server

System Action: None.

User Response: None.

BFSxx1852I The specified files or directories were not found on the file server's backup server.

Explanation: No data exists on the file server's backup server for the specified resource.

Source: LAN Server

System Action: Processing ends.

User Response: For a RESTORE request, ensure that the source specification is correct and that the file server's backup server backup repository is available. Directories are not restored if no files are found on RESTORE.

For an INCREMENTAL backup request, no files or directories exist on the backup server the first time the request is issued. If data is backed up to the file server, ensure that the correct file server's backup node was specified.

BFSxx1900I Enter an administration command for the file server *lfsadminid* **or** *termination_keyword* **to end:**

Explanation: The LFSCMD command is ready for the file server host program administrator to enter a command, or to enter the termination keyword (typically END) to end the LFSCMD command. The termination keyword can be entered in either uppercase or lowercase letters.

Source: LAN Server

System Action: If the file server administrator chooses to end the session, then communication with the file server specified on the LFSCMD command is ended and the LFSCMD command ends. Anything else entered by the file server's administrator in response to this prompt is assumed to be a command.

LFSCMD checks the syntax of the command, passes the command to the file server host program for processing (assuming no syntax errors were found), and waits for the command responses. After all of the responses to the command are received from the file server and displayed at the administrator console, the LFSCMD command will reenter the above prompt. This process continues until the file server host program administrator enters the termination keyword.

User Response: Enter a file server host program command or the termination keyword.

BFSxx1902E Unknown LFSCMD command keyword: *keyword*

Explanation: The *keyword* specified on the LFSCMD command line is not a valid file server host program command keyword.

If the *keyword* is 50 characters long or less, the entire *keyword* is shown in the error message. Otherwise, the *keyword* will be truncated.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the LFSCMD command, specifying a valid command.

BFSxx1903E Invalid user specification: *username*

Explanation: The *username* specified on the file server host program administration command is not a valid user name.

If the *username* is 50 characters long or less, the entire *username* is shown in the error message. Otherwise, the *username* will be truncated.

Note: Some file server commands allow the *userid*, *fepname* or both to be specified as a single asterisk, to indicate all users or all front-end processors. However, this message will be displayed if an asterisk is used on a command that does not allow it.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid *username*.

BFSxx1904E Invalid group specification: *groupid*

Explanation: The *groupid* specified on the file server host program command is not a valid group name.

If the *groupid* is 50 characters long or less, the entire *groupid* is shown in the error message. Otherwise, the *groupid* will be truncated.

A group name is a 1- to 20-character name consisting of the characters A-Z, 0-9, are folded to uppercase.

Note: Some file server commands allow the *groupid* to be specified as a single asterisk, to indicate all groups. However, this message will be displayed if an asterisk is used on a command that does not allow it.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid *groupid*.

BFSxx1905E Invalid resource specification: *resource*

Explanation: The *resource* specified on the file server host program administration command is not a valid resource name.

If the resource name is 50 characters long or less, the entire name is shown in the error message. Otherwise, the resource name will be truncated.

Some file server commands allow the resource name to be specified as a single asterisk, to indicate all resources. However, this message is displayed if an asterisk is used on a command that does not allow it.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid resource name.

BFSxx1906E Invalid FEP name: *fepname*

Explanation: The *fepname* specified on the file server host program command is not a valid front-end processor (FEP) name.

If the *fepname* is 50 characters long or less, the entire *fepname* is shown in the error message. Otherwise, the *fepname* will be truncated.

A FEP name is a 1- to 8-character name consisting of alphabetic (A - Z, a - z), numeric (0 - 9), or national (#, $, or @) characters. The front-end processor will convert lowercase characters to uppercase.

Note: Some file server commands allow the *fepname* to be specified as a single asterisk, to indicate all front-end processors. However, this message will be displayed if an asterisk is used on a command that does not allow it.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid *fepname*.

BFSxx1907E Invalid network name: *netname*

Explanation: The *netname* specified on the file server host program command is not a valid network name. If the *netname* is 50 characters long or less, the entire *netname* is shown in the error message. Otherwise, the *netname* will be truncated.

Note: Some file server commands allow the *netname* to be specified as a single asterisk, to indicate all network names. However, this message will be displayed if an asterisk is used on an command that does not allow it.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid *netname*.

BFSxx1908E Invalid path/file specification: *filespec*

Explanation: The *filespec* specified on the file server host program administration command is not valid.

If the *filespec* is 50 characters long or less, the entire *filespec* is shown in the error message. Otherwise, the *filespec* will be truncated.

Some LAN Server commands allow the OS/2 wildcard characters (* and ?) to be used in the *filename* field. However, this message is displayed if the wildcard characters are used on a command that does not allow it.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid *filespec*.

BFSxx1910E Invalid password specification *userid* **an invalid parameter or option.**

Explanation: The password specified on the file server host program administration request or in the configuration record is not a valid password. As much of the incorrect password as possible is shown in the error message.

Source: LAN Server

System Action: No action is taken.

User Response: Reenter the request specifying a valid password.

BFSxx1913E The 'APPEND' option cannot be used at the same time the 'TREE' or 'REPLACE' options are specified.

Explanation: The APPEND option specified on the administration command conflicts with other specified options.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a valid set of options.

BFSxx1914E Wildcard characters cannot be used with the 'TREE' option. or **Wildcard characters are valid only with the 'TITLE' option.**

Explanation: The TREE option of the COPY command copies an entire directory tree (that is, all files and subdirectories) from one file server's disk or directory to another. This form of the COPY command will not allow wildcard characters (* and ?) to be specified in either the source or target path or file name strings, because the command is intended to copy all files, not just those that match a wildcard pattern.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Enter the command again without the TREE option or with path or file specifications that do not use the wildcard characters.

BFSxx1915I Communication started with the file server *lfsadmid***.**

Explanation: This message is displayed when communication is started between a file server host program administrator and a file server.

Source: LAN Server

System Action: Communication paths are established between an administrator and a file server during LFSCMD or LFSBR command initialization, and are ended at LFSCMD or LFSBR command completion.

User Response: None. If a command was specified on the LFSCMD or LFSBR command line, then any messages following this message are the results of the specified command. If no command was specified on the LFSCMD or LFSBR command line, then LFSCMD or LFSBR prompts the user for a command.

BFSxx1916I Communication failed with file server *lfsadmid***.**

Explanation: Communication with file server *lfsadmid* that was established by the LFSCMD or LFSBR command is no longer active. This message displays when the communication paths end abnormally between commands, for some reason other than the normal ending of the LFSCMD or LFSBR command.

Many conditions can cause a communications problem. For example:

- A software or hardware problem occurs on the communications path between the file server host program administrator and the file server.
- The file server ends, either normally or abnormally.

Source: LAN Server

System Action: The LFSCMD or LFSBR command automatically tries to restart communications with the specified file server. Additional messages display to indicate the success or a problem with the restart attempt. If communications with the file server restarts successfully, the LFSCMD or LFSBR command processing continues as if no communications problem occurred.

User Response: None.

BFSxx1917I Attempting to restart communication with file server *lfsadmid***.**

Explanation: The LFSCMD or LFSBR command is trying to establish communications with the file server *lfsadmid* again.

Source: LAN Server

System Action: Additional messages display to indicate the success or a problem with the restart attempt. If communications with the file server restarts successfully, the LFSCMD or LFSBR command processing continues as if no communications problem occurred.

User Response: None.

BFSxx1918E Unable to establish communication with file server *lfsadmid***.**

Explanation: The LFSCMD or LFSBR command cannot establish communications with file server *lfsadmid*.

Source: LAN Server

System Action: Because communication is not established with the file server, the command was not performed. An additional error message will display indicating why communications cannot be established.

User Response: Use the additional error message to determine why communications cannot be established with the file server. Enter the LFSCMD or LFSBR command again, after the problem is corrected.

BFSxx1919E Unable to receive command responses from file server *lfsadmid***. The result of the previous command is unknown.**

Explanation: The LFSCMD or LFSBR command was unable to receive all of the responses to the command from the file server *lfsadmid*, because of a communications problem with the file server.

Source: LAN Server

System Action: Because communications with the file server ended before the command completed, the result of the command is unknown. Processing of the command ends.

User Response: The file server host program administration QUERY command determines the results of the previous command.

If attempting to enter the QUERY command to the file server results in error messages indicating communications cannot be established with the file server, use the error messages to determine the cause of the communications problem. When the problem is corrected, use the administration QUERY command to determine the results of the previous command. Enter the command again, if necessary.

BFSxx1920I Communication ended with file server *lfsadmid*.

Explanation: The LFSCMD or LFSBR command has successfully ended communications with file server *lfsadmid*.

Source: LAN Server

System Action: Processing of the command ends.

User Response: None.

BFSxx1922E The maximum number of communication connections for the specified file server was exceeded.

Explanation: The LFSCMD or LFSBR command cannot establish communications with the specified file server because the maximum number of communications connections specified by the MAXSESSIONS parameter in the VTAM application ID entry for the file server was exceeded.

The LFSCMD or LFSBR command requires two communication paths between a file server host program administrator and the file server being administered. The MAXSESSIONS parameter in the VTAM application ID entry for the file server host program must be large enough to accommodate two communication paths to each of the administrators that administer the file server concurrently, in addition to the communication paths required for each of the front-end processors for the file server.

Source: LAN Server

System Action: Because communications cannot be established with the file server, the command specified on the LFSCMD or LFSBR command was not performed. Processing of the command ends.

User Response: Contact your system administrator to have the MAXSESSIONS value for the VTAM application ID entry for the file server host program increased.

BFSxx1923E Communication was ended by the file server.

Explanation: The LFSCMD or LFSBR command cannot establish communications with the specified file server host program because the server ended communications before initialization was complete. This message displays when an authorization, communications protocol, or other error is detected by the file server that will not allow the communication paths from the file server host program administrator to be established.

Source: LAN Server

System Action: Because communications cannot be established with the file server, commands specified on the LFSCMD or LFSBR command are not performed. Processing of the LFSCMD or LFSBR command ends.

User Response: Examine the file server host program SYSPRINT or Audit File for additional error messages. Enter the LFSCMD or LFSBR command again, after the problem is corrected.

BFSxx1924E The specified file server is inactive or undefined.

Explanation: The LFSCMD or LFSBR command cannot establish communications with the specified file server host program because the file server is not running or is not defined.

Source: LAN Server

System Action: Because communications cannot be established with the file server, commands specified on the LFSCMD or LFSBR command are not performed. Processing of the command ends.

User Response: Check the *lfsadmid* specified on the LFSCMD or LFSBR command to ensure that it was entered correctly. The *lfsadmid* must be the same as the ADMINID parameter in the CONFIG configuration file. If the *lfsadmid* was entered correctly, the file server must be restarted before commands can be entered, otherwise, enter the LFSCMD or LFSBR command again with the correct *lfsadmid*.

BFSxx1925E An unexpected VTAM communication error has occurred for the control or qualify operation *control/qualify*. Return code is *return-code*, reason is *reason*, rtncd is *rtncd*, fdbk2 is *fdbk2*, rcpri is *rcpri*, rcsec is *rcsec*.

Explanation: The LFSCMD or LFSBR command received an unexpected error condition from the VTAM communications operation *control/qualify*.

Source: LAN Server

System Action: Additional error messages may display indicating the results of the specified file server host program command.

User Response: Verify that the specified file server was started and is fully initialized. If the file server was active, examine the VTAM return codes and *OS/390 eNetwork Communications Server: SNA Programming* book to determine the cause of the communications problem. Enter the LFSCMD or LFSBR command again, after the problem is corrected.

BFSxx1926E '*' cannot be specified for both the FEP name and network name.

Explanation: An unusable form of the SHARE command was specified.

The SHARE command will not permit a file server host program administrator to delete all SHARE definitions for all front-end processors (FEPs) in a single command. This reduces the possibility of an administrator accidentally deleting the SHARE information for ALL front-end processors.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the SHARE command, specifying a valid front-end processor name or network name in place of one or both of the * parameters.

BFSxx1927E Copying a directory tree to a lower subdirectory is not permitted.

Explanation: The TREE option of the COPY command cannot be used to copy a directory tree to a target subdirectory that is below the source directory. This would cause a looping condition that would eventually fill the data set.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the COPY command, if necessary, specifying a target directory that is not a subdirectory of the source directory.

BFSxx1928E *lfsadmid* **is not a file server command handler.**

Explanation: The *lfsadmid* specified on the LFSCMD or LFSBR command is not the VTAM application ID of a file server host program command handler. The *lfsadmid* must be the same as the ADMINID parameter in the CONFIG configuration file of the file server being administered.

Source: LAN Server

System Action: Because communications cannot be established with the file server, commands specified on the LFSCMD or LFSBR command are not performed. Processing of the LFSCMD or LFSBR command ends.

User Response: Enter the LFSCMD or LFSBR command again, specifying a valid *lfsadmid*.

BFSxx1929E A subdirectory must be specified on this request.

Explanation: The request submitted requires that a subdirectory be specified on the resource field.

Source: LAN Server

System Action: Processing of the command ends.

User Response: Reenter the command, specifying a subdirectory on the resource field.

BFSxx1934E Invalid export name *name***.**

Explanation: The export name supplied on the request is not valid. A valid export name is a 1- to 12-character name consisting of any valid UNIX file naming characters. Check the length of the string supplied as an export name.

Source: LAN Server

System Action: No action is taken. Processing of the request ends.

User Response: Enter the request again, specifying a valid value for the export name.

BFSxx1937E The MIXED and FOLD options cannot be used at the same time.

Explanation: The MIXED and FOLD options were specified for CREATE DIRECTORY at the same time. These are mutually exclusive options, and only one case option may be specified.

Source: LAN Server

System Action: Processing ends.

User Response: Enter the command again, specifying only one case option, FOLD or MIXED.

BFSxx1939E The administration code level does not match that of the server.

Explanation: Either the administration code is for a newer level of the file server host program than the server code, or the opposite is true.

Source: LAN Server

System Action: The connection between the administrator and the file server is not established.

User Response: Check the code levels for the administration and server code, upgrade the back-level code, and reenter the command.

BFSxx1960E The PCNFS keyword was specified but SECURITY EXTERNAL was not specified.

Explanation: The user specified the PCNFS keyword in the CONFIG configuration file but did not specify SECURITY EXTERNAL in the NFSLFS configuration file.

Source: LAN Server

System Action: If this condition is detected the file server host program initialization will be terminated.

User Response: If PCNFSD Authorization verification is desired, then the user must specify PCNFS in the CONFIG configuration file and must also specify SECURITY EXTERNAL in the NFSLFS configuration file. Restart the file server host program.

BFSxx1961E The NOPCNFSAUTH keyword was specified but SECURITY EXTERNAL was not specified.

Explanation: The user specified the NOPCNFSAUTH keyword in the file server's NFSLFS configuration file, but did not specify SECURITY EXTERNAL in the NFSLFS configuration file.

Source: LAN Server

System Action: If this condition is detected the file server host program initialization will be terminated.

User Response: The user must specify both keywords in the CONFIG configuration file. Restart the file server host program.

BFSxx1968W More than 1024 NOPCNFSAUTH records were specified.

Explanation: The user specified more than 1024 NOPCNFSAUTH records in the file server host program NFSLFS configuration file.

Source: LAN Server

System Action: If this condition is detected the records after the 1024th record will not be processed and the file server host program initialization will continue. The file server host program will assume that these users are using the PCNFSD Authentication verification protocol and the Authentication verification will fail for these users.

User Response: The user can only specify a maximum of 1024 NOPCNFSAUTH records.

BFSxx2022I INPUT operation completed for:

Explanation: An INPUT operation for an asset has completed successfully. The name of the file will be displayed in a following message.

Source: LAN Server

System Action: Normal system processing continues.

User Response: None.

BFSxx2023E INPUT operation failed for:

Explanation: An INPUT operation for an asset has failed. The name of the file will be displayed in a following message.

Source: LAN Server

System Action: Normal system processing continues.

User Response: Reissue the command which initiated the operation when the cause of the failure has been determined.

Messages from LAN Server Code in the OS/2 LAN Server Front-end Processor

These messages do not have a severity code indicator. All LAN Server OS/2 LAN Server Front-end Processor messages begin with time stamps.

BFS3000 File Services communications started.

Explanation: Informational message indicating that the communications with a host to share host files is starting.

User Response: None.

Source: LAN Server

BFS3001 File Services communications initialization complete.

Explanation: Informational message indicating that the initialization process for communications with a host is complete.

User Response: None.

Source: LAN Server

BFS3002 File Services communications terminated.

Explanation: Informational message indicating that the communications with a host to share host files has stopped.

User Response: None.

Source: LAN Server

BFS3003 Unable to allocate memory.

Explanation: The File Services code was unable to reserve memory to hold internal control blocks or buffers.

User Response: Installing more memory on this OS/2 machine may alleviate out-of-storage conditions. Also, stopping other applications that are running on this server, and that reserve memory, will free memory for this machine. Lastly, you may need to reduce the cache and heap sizes for OS/2 LAN Server, the HPFS File System Driver, and the File Services File System Driver. See *OS/390 LAN Server Installation Guide* for a discussion of HPFS memory settings.

Source: LAN Server

BFS3004 Unable to allocate memory from OS/2, return code = *return-code*.

Explanation: The File Services code was unable to reserve memory to hold internal control blocks or buffers.

User Response: See the User Response for message 3003. Return codes for this message are documented under the DosAllocSeg command in *OS/2 Warp V3 Control Program Programming Reference*.

Source: LAN Server

BFS3005 Unable to start a thread.

Explanation: File Services communications is a multi-threaded process. An error was encountered while generating threads. Some threads may already have been generated when the error was encountered.

User Response: This problem may be because of insufficient memory on the server. Try installing more memory or deleting applications that reserve memory.

Source: LAN Server

BFS3006 Line *number*: Value of *keyword* must be greater than or equal to *value*, or *alternative_value*.

Explanation: In the configuration file, the value of the specified keyword must be greater than or equal to the first specified value, or must be the alternative value.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3007 File Services termination requested by operator.

Explanation: Informational message indicating that the operator of this server ordered the Front-end Processor to end the sharing of host resources.

User Response: None.

Source: LAN Server

BFS3008 Path to *resource*: Communications verb *verb* failed, return code = *return-code*.

Explanation: A problem occurred during the execution of the named communications verb.

User Response: Use the *CPI Communications Reference* book to look up the return code. Then see the Communications Manager/2 APPC publications for a description of the return code and possible remedies.

Source: LAN Server

BFS3009 Path to *resource*: Terminating due to failure of connection.

Explanation: File Services was unable to activate a communications link with a host. The indicated path is ending. The link will be retried after a delay of one of the following:

- The time specified in the RETRY_WAIT_TIME record in the configuration file
- 60 seconds, if the RETRY_WAIT_TIME record is omitted from the configuration file

User Response: Previous error messages should indicate the root cause of the problem. Correct the problem and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3010 Processing configuration file *name*.

Explanation: File Services is processing the indicated configuration file.

User Response: To change the configuration file being processed, enter the path and name of the new configuration file as a parameter on the BFSSERV command.

Source: LAN Server

BFS3011 Unable to open file *name*.

Explanation: An error occurred while attempting to open the named file.

User Response: Make sure the file exists. If it does, make sure the path information for File Services is correctly entered to point to the file. (This can be from either the PATH environment variable or a path name entered in a configuration file or on a command.) Lastly, make sure that the limit on concurrently opened files has not been exceeded. This limit can be changed by adjusting the FILES record in CONFIG.SYS.

Source: LAN Server

BFS3012 Found multiple *keyword* keywords under *keyword* = *value*, using value *value*.

Explanation: More than one record with the indicated keyword was found in the configuration file. Only one was expected. The last valid value found will be used, unless the keyword is the BFS_LOG_FILE record, in which case the first valid value will be used.

User Response: If the configuration file is incorrect, stop host communications, correct the configuration file, and restart host communications.

Source: LAN Server

BFS3013 Large block path to *resource*: Communications verb *verb* failed, return code = *return-code*

Explanation: A problem occurred during the execution of the named communications verb.

User Response: Use the *CPI Communications Reference* book to look up the return code. Then see Extended Services or Communications Manager/2 APPC publications for a description of the return code and possible remedies.

Source: LAN Server

BFS3014 Unable to access shared server segments, return code = *return-code*. The OS/2 LAN Server may not be started.

Explanation: File Services shares segments with the OS/2 LAN Server. This message indicates that the shared memory could not be accessed by File Services. The return codes in this message are those of the DosGetShrSeg API, which is documented in the **OS/2 Programming Tools and Information Version 1.3 Manager Macro Assembler/2** books.

The return code *2* indicates that perhaps the OS/2 LAN Server has not been started. This return code indicates “segment not found.”

User Response: If the OS/2 LAN Server has not been started, start it, and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3015 Line *number*: Unknown keyword *keyword*.

Explanation: The specified line contains an unknown keyword. This line will be ignored.

User Response: If the configuration file is incorrect:

1. Stop File Services on the Front-end Processor
2. Correct the configuration file
3. Restart File Services on the Front-end Processor

If the configuration file is correct but contains keywords that a back level of File Services cannot understand, no action is needed.

Source: LAN Server

BFS3016 Line *number*: Syntax error.

Explanation: Either:

- The specified line is not in the format

  ```
  keyword = value
  ```

  followed by a comment delimited by a semicolon, or
- The value contains characters not allowed for the keyword, such as characters in a number which are not digits.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3017 Large block path from *resource*: Protocol or data error detected from partner. Last data_received value = *number*, total_data = *number*, last data_length = *number*.

Explanation: File Services on the Front-end Processor detected an error in the sequence or format of data sent by the host. The values displayed in the message are meant to aid in debugging the problem.

User Response: Report an error in the host code. The Front-end Processor log file with this message in it should be saved to help debug the problem.

Source: LAN Server

BFS3018 Line *number*: Length of *keyword* value is greater than *number* characters.

Explanation: The length of the string specified is limited to the indicated number of characters.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3019 Line *number*: Value of *keyword* contains non-integer characters or is out of range.

Explanation: The value associated with the indicated keyword must be a base-10 integer less than or equal to 65535. Remember that the tokens are blank-delimited, so, for example, `1x` is not valid.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3020 No valid *keyword* keyword found.

Explanation: The configuration file did not contain a valid record with the indicated keyword and a value. One is required for File Services processing to continue.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3021 Line *number*: Value of *keyword* must be *value* or *value*.

Explanation: The value associated with the indicated keyword must be one of the two listed values.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3022 Large block path to *resource*: Terminating due to failure of connection.

Explanation: File Services was unable to activate a communications link with a host. The indicated path is terminating. The link will be retried after a delay of one of the following:

- The time specified in the RETRY_WAIT_TIME record in the configuration file
- 60 seconds, if the RETRY_WAIT_TIME record is omitted from the configuration file

User Response: Previous error messages should indicate the root cause of the problem. Correct the problem and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3023 Found multiple *keyword* keywords, using value *value*.

Explanation: More than one record with the indicated keyword was found in the configuration file. Only one was expected. The last valid value found will be used, unless the keyword is the BFS_LOG_FILE record, in which case the first valid value will be used.

User Response: If the configuration file is incorrect:

1. Stop File Services on the Front-end Processor
2. Correct the configuration file
3. Restart File Services on the Front-end Processor

Source: LAN Server

BFS3024 Line *number*: Value of *keyword* must be between *number* and *number*.

Explanation: The value associated with the indicated keyword must be within the specified range (inclusive).

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3025 No valid host resource name found to communicate with.

Explanation: The configuration file did not contain a valid OLSID entry naming a host resource to communicate with. File Services on the Front-end Processor will exit.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3026 Thread *number* initialized for inbound communications from resource *resource*.

Explanation: Informational message indicating that a thread to receive messages from the host has been started. The thread number is given.

User Response: None.

Source: LAN Server

BFS3027 Thread *number* initialized for outbound communications to resource *resource*.

Explanation: Informational message indicating that a thread to send messages to the host has been started. The thread number is given.

User Response: None.

Source: LAN Server

BFS3028 Path from *resource*: Protocol or data error detected from partner.

Explanation: The File Services communications code detected an error in the sequence or format of data sent by the host.

User Response: Report an error in the host code.

Source: LAN Server

BFS3029 Path from *resource*: Partner has severed communications.

Explanation: Informational message indicating that the communicating partner has severed communications.

User Response: If there was no error indication previous to this message, contact host systems administration personnel to find out why contact was broken.

Source: LAN Server

BFS3030 Unable to do DosFSCtl to the OS/2 LAN Server FSD, return code = *value*.

Explanation: An attempt to use the DosFSCtl API to contact the OS/2 LAN Server File System Driver failed. The return code is that from the DosFSCtl API. A return code value of *1* usually indicates that the Advanced LAN Server HPFS386 module was not installed. This module must be installed even if there are no HPFS drives on the OS/2 LAN Server which is the Front-end Processor.

User Response: If possible, correct the problem indicated by the return code and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3031 The OS/2 LAN Server FSD is not functioning properly. Contact your service representative.

Explanation: During initialization, File Services performs a small check to ensure that the correct software levels are available. This message is given when some strange condition exists with the OS/2 LAN Server.

User Response: Contact your IBM Service Representative.

Source: LAN Server

BFS3032 Unable to do DosFSCtl to the File Services FSD, return code = *value*.

Explanation: An attempt to use the DosFSCtl API to contact the File Services File System Driver failed. The return code is that from the DosFSCtl API.

User Response: If possible, correct the problem indicated by the return code and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3033 The File Services FSD is not functioning properly. Contact your service representative.

Explanation: During initialization, File Services performs a small check to ensure that the correct software levels are available. This message is given when some strange condition exists with the File Services FSD.

User Response: Contact your IBM Service Representative.

Source: LAN Server

BFS3034 Unable to access shared server segments, return code = *return-code***.**

Explanation: File Services shares segments with other server processes in OS/2 LAN Server. File Services was unable to gain access to the necessary shared segments, probably because a concurrent access limit was reached. The return codes for this message are those of the DosGetShrSeg API, which is documented in the **OS/2 Programming Tools and Information Version 1.3 Manager Macro Assembler/2** manuals.

User Response: Restart OS/2 LAN Server and File Services to clean up accesses to shared segments.

Source: LAN Server

BFS3035 Resource name *name* **is not the name of a host resource sharing machine.**

Explanation: The named resource, from an OLSID record in the Front End Processor configuration file, was not the name from an OLSID statement in the host configuration file. It may match an ADMINID or other record, but it should match an OLSID record. This name tells File Services what name to connect to share resources with users. The name is actually a different type of name, perhaps an administration contact.

User Response: Check with host administrators for the proper OLSID value. Correct the Front-end Processor configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3036 Path from *resource***: Error processing host SMB response, return code =** *return-code***.**

Explanation: An error was encountered while processing a host SMB or host response to an SMB. This should not occur. The return codes are:

1 Host returned a bad pointer to a Front-end Processor control block (SMB_QELEMENT).

2 Host returned a response to an SMB that had not yet been sent.

3 An error occurred while changing 2- and 4-byte fields in the host response to Intel format.

4 The server is shutting down.

5 The host returned a response, but there was no File Services OS/2 processing thread waiting for this response.

6 No memory is available to build control blocks to process this response.

7 No selectors are available to build a segment:offset address for a receive buffer area.

8 No memory is available to build a Negotiate Protocol SMB request to start this connection.

9 The Front-end Processor was unable to obtain a NETBIOS block from the system.

10 The Front-end Processor was unable to get memory to use as a response buffer.

User Response: User responses depend on the return code as follows:

4 None. The server was stopping, but because of the timing of arrival of data from the host, the Front-end Processor tried to process the data before completely shutting down. This can be ignored. It probably means that some user had an operation in progress that was interrupted.

1, 2, 3, 5 Contact your server service representative and report a problem with File Services. The problem is probably in the host code, because it appears to have sent incorrect data to the Front-end Processor.

6, 8, 10 See the User Response for message 3003.

7 If possible, increase the number of selectors preallocated by OS/2 (consult the base OS/2 publications). If this is not possible, you will need to set up a second Front End Processor for this LAN to offload some of the demand from the current Front-end Processor.

9 Use the IBMLAN.INI and PROTOCOL.INI file statements or LAPS configuration utilities to increase the number of NetBIOS control blocks that are preallocated. (See the OS/2 LAN Server and Network administration publications for information on how to do this.)

Source: LAN Server

BFS3037 Path from *resource***: Host-detected error while initializing path, return code =** *return-code*

Explanation: This return code is generated by the File Services host code. It is returned to the Front-end Processor attempting to establish communication with the host when File Services code is started on the Front-end Processor. Probably this indicates a duplication of Front-end Processor names, or a Front-end Processor with an unknown name. The return codes are:

2 Unable to locate the corresponding Front-end Processor control block.

4 Requests from Front-end Processor received out of expected sequence (request to connect Large Block Transfer path made before connection of main path).

8 Insufficient memory in File Services virtual machine (or address space) on the host.

10 The host reported an error in the Negotiate Protocol SMB, or there was an error transforming the Negotiate Protocol SMB to or from host format. Retry the operation.

11 Incorrect SMB sent from the Front-end Processor. Notify service personnel.

87 Negotiated buffer size too small for requested SMB service. Change the WORKBUFSIZE parameter in the Front-end Processor IBMLAN.INI file.

89 Too many users or Front-end Processors have connected to the host File Services server machine. The MAXUSERS parameter in the File Services configuration file for the host must be increased by the host administrator. Until this action is taken, or some users or Front-end Processors disconnect, the connection to the host cannot be made. The File Services configuration on a VM host is in the LFS CONFIG file; on an MVS host, it is in the file specified by the CONFIG DD statement in the File Services start up job control language.

90 FEP_NAME in BFS.INI must match the USERID name entered in Communications Manager/2 under CPIC side information. If using PWSCS, the FEP_NAME in BFS.INI must match the USERID in ACPI.INI. This condition will also occur if the FEP_NAME is already in use by another Front-end Processor.

92 See the User Response for message 3099.

User Response: Correct the problem indicated by the return code and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3038 Host and FEP code level mismatch detected with resource *resource***: FEP at level** *number***, host at level** *number***.**

Explanation: The File Services code in the Front-end Processor is not at the same level as the File Services code in the host. Front-end Processors and hosts should be at similar code levels.

User Response: Install equivalent release levels of Front-end Processor and host code. Restart File Services on the Front-end Processor.

Source: LAN Server

BFS3039 Path from *resource***: Communications verb** *verb* **failed, return code =** *return-code*

Explanation: A problem occurred during the execution of the named communications verb.

User Response: Use the *CPI Communications Reference* book to look up the return code. Then see the Extended Services or Communications Manager/2 APPC publications for a description of the return code and possible remedies.

Source: LAN Server

BFS3040 Large block path from *resource***: Communications verb** *verb* **failed, return code =** *return-code*

Explanation: A problem occurred during the execution of the named communications verb.

User Response: Use the *CPI Communications Reference* book to look up the return code. Then see the Extended Services or Communications Manager/2 APPC publications for a description of the return code and possible remedies.

Source: LAN Server

BFS3041 Thread *number* **initialized for large block inbound communications from resource** *resource***.**

Explanation: Informational message indicating that a thread to receive messages from the host has been started. The thread number is given.

User Response: None.

Source: LAN Server

BFS3042 Thread *number* **initialized for large block outbound communications to resource** *resource***.**

Explanation: Informational message indicating that a thread to send messages to the host has been started. The thread number is given.

User Response: None.

Source: LAN Server

BFS3043 Large block path from *resource***: Partner has severed communications.**

Explanation: Informational message indicating that the communicating partner has severed communications.

User Response: If there was no error indication previous to this message, contact host systems administration personnel to find out why contact was broken.

Source: LAN Server

BFS3044 Line *number***: Value of** *keyword* **must be** *value* **or** *value* **or** *value***.**

Explanation: The value of the specified keyword must be one of the values listed.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3045 Large block path from *resource***: unable to allocate large receive buffer from FSD, return code =** *return-code*

Explanation: The specified communications path was unable to allocate a buffer to post a receive for data from the host. In this case the buffer is simply physical memory, which the File Services FSD attempted to allocate using device driver calls. Return code meanings are:

6 No memory is available to build control blocks to process this response

7 No selectors are available to build a segment:offset address for a receive buffer area.

User Response: User responses depend on the return code as follows:

6 See the User Response for message 3003.

7 If possible, increase the number of selectors preallocated by OS/2 (consult the base OS/2 publications). If this is not possible, you will need to set up a second Front End Processor for this LAN to offload some of the demand from the current Front-end Processor.

Source: LAN Server

BFS3046 Host resource name (OLSID) *resource* **cannot be located.**

Explanation: The OLSID record specifies the VTAM APPLID of a host resource that the Front-end Processor will attempt to contact. This message indicates that the specified name could not be contacted, because it did not exist as far as the local communications code could determine. It may be misspelled, the host which should own that resource may be down, the File Services host code may not be started, or the communications links may be inactive for some reason.

User Response: Check the spelling of the OLSID record in the BFS.INI file. Make sure it matches the host OLSID value. Remember that the BFS.INI values are case-sensitive. If the connection is PWSCS or Communications Manager/2 APPC, check that the communications code is active. Look in the appropriate error logs (ACPI.LOG for PWSCS, Communications Manager message log for CM/2) for indications of problems with communications code. For a CLAW connection, the best option is to restart the Front End Processor and observe any messages displayed when the CLAW connections are brought online. Restart File Services on the Front-end Processor.

Source: LAN Server

BFS3047 Path to *resource*: sending SMB to host:

Explanation: This message is printed in the log file before each SMB that is sent to the host from the Front-end Processor when tracing is active. The SMBs are dumped in host format; that is, all two-byte and four-byte fields are in *most-significant-byte-left* format. SMBs preceded with this message are being sent TO the host for processing. Usually this means they are user requests, although in some instances they may be Front-end Processor responses to host server commands.

User Response: None.

Source: LAN Server

BFS3048 Path from *resource*: received SMB from host:

Explanation: This message is printed in the log file before each SMB that is received from the host when tracing is active. The SMBs are dumped in host format; that is, all two-byte and four-byte fields are in *most-significant-byte-left* format. These SMBs will be host responses to user requests, although occasionally they may be host commands to the Front-end Processor.

User Response: None.

Source: LAN Server

BFS3049 Path from *resource*: Unexpected SMB or unrecognized data received from host.

Explanation: An unexpected condition has been detected between the host and the OS/2 Front-end Processor. Data was received from the host that appears to be a command for the Front-end Processor, but contains unusable data or unknown command codes.

User Response: Contact your IBM Service Representative.

Source: LAN Server

BFS3050 Large block path from *resource*: Error processing host SMB response, return code = *return-code*.

Explanation: An error occurred while processing a host SMB or host response to an SMB. This should not occur. The return codes are:

1 Host returned a bad pointer to a Front-end Processor control block (SMB_QELEMENT).

2 Host returned a response to an SMB that had not yet been sent (a very unusual situation).

3 An error occurred while changing 2- and 4-byte fields in the host response to Intel format.

4 The server is shutting down.

5 The host returned a response, but there was no File Services OS/2 processing thread waiting for this response.

6 No memory is available to build control blocks to process this response.

7 No selectors are available to build a segment:offset address for a receive buffer area.

9 The Front-end Processor was unable to obtain a NETBIOS block from the system.

User Response: See the User Responses for message 3036.

Source: LAN Server

BFS3051 Line *number*: duplicate *keyword* value *value* found and ignored.

Explanation: While processing the configuration file, a duplicate value for the specified keyword was found. This duplicate information is ignored.

User Response: If the configuration file is incorrect, correct it, and then restart File Services on the Front-end Processor.

Source: LAN Server

BFS3052 Large block path to *resource*: sending SMB to host:

Explanation: This message is printed in the log file before each SMB that is sent to the host on the large block path when tracing is active. The SMBs are dumped in host format; that is, all two-byte and four-byte fields are in *most-significant-byte-left* format. SMBs preceded with this message are being sent TO the host for processing. Usually this means they are user requests, although in some instances they may be Front-end Processor responses to host server commands.

User Response: None.

Source: LAN Server

BFS3053 Large block path from *resource*: received SMB from host (*number* bytes):

Explanation: This message is printed in the log file before each SMB that is received from the host on the large block path when tracing is active. The SMBs are dumped in host format; that is, all two-byte and four-byte fields are in *most-significant-byte-left* format. These SMBs will be host responses to user requests, although occasionally they may be host commands to the Front-end Processor. Additionally, because they are on the *large block* data path, they may be quite large. Therefore, only a portion of each SMB is dumped, and an indication of the total size of the SMB is printed.

User Response: None.

Source: LAN Server

BFS3054 Large block path from *resource*: Unexpected SMB or unrecognized data received from host.

Explanation: An unexpected condition has been detected between the host and the OS/2 Front-end Processor. Data was received from the host that appears to be a command for the Front-end Processor, but contains unusable data or unknown command codes.

User Response: Contact your IBM Service Representative.

Source: LAN Server

BFS3055 <<*time_date*>> **Linked LAN Server FSD with File Services FSD.**

Explanation: Informational message indicating the OS/2 LAN Server File System Driver has been successfully linked with the File Services File System Driver server module.

Note: This message will appear only in the log file (if one is specified) for the BFSLINK service.

User Response: None.

Source: LAN Server

BFS3056 Error in API call *name*, return code = *return-code*.

Explanation: This message indicates an error in the specified API call. The return code is that of the API call, which may be looked up in **OS/2 Programming Tools and Information** manuals.

User Response: If possible, correct the condition indicated by the return code. Restart File Services on the Front-end Processor.

Source: LAN Server

BFS3057 Failure in CLAW connection to resource *resource*, return code = *number*.

Explanation: File Services was unable to activate a communications link with a host. The communication path was a channel card with the CLAW device driver. The link will be retried, after a number of seconds determined by the RETRY_WAIT_TIME record in the BFS.INI file (default is 60 seconds).

Possible return codes:

-10 The amount of data sent from the host exceeded the maximum data receive size of the Front-end Processor. Contact your IBM Service Representative.

-6 The device driver has not been identified correctly to the system. Check to ensure that the DEVICE= statement in CONFIG.SYS is specified correctly. Restart the system and retry the operation.

-5 The device driver has not been initialized correctly.

-4 The device driver has received more than 10 connection initialization commands from software on this machine. If possible, restart this system, making sure not to run any other applications on this machine that use this device driver, and retry the operation.

-2 No device driver was found for the channel card. Make sure that CONFIG.SYS contains a DEVICE= statement for the correct channel card device driver. Also make sure that the File Services initialization file contains a valid DD_NAME= statement for the correct channel card device driver.

-1 No FSD resources were available to start the connection to the host. The resource in this case is a private executable *thread* (not an OS/2 thread) within the File Services File System Driver. This should happen only if the OS/2 LAN Server was incredibly busy at the time that File Services was started.

01 An error occurred in the CLAW connection response from the host. Retry the operation.

02 An error occurred while sending a connection request to the CLAW adapter card. Retry the operation.

114 The resource name could not be found. This resource name corresponds to both the fepname parameter on the LINK statement in the File Services configuration file for the host and the FEP_NAME parameter in BFS.INI (or equivalent Front End Processor configuration file). The File Services configuration on a VM host is in the LFS CONFIG file; on an MVS host, it is in the file specified by the CONFIG DD statement in the File Services start up job control language. Coordinate these names, restart the system, and retry the operation.

115 The physical channel link is not active. Make sure that a START command for the Front-end Processor link has been issued on the File Services host. Check the host and Front-end Processor configuration files to ensure that the parameters are set correctly. Restart the Front-end Processor if any changes are made to Front End Processor configuration files.

Note: See the Configuration Parameter Coordination table in the Setting Up chapter of the *OS/390 LAN Server Installation Guide* book for details. Retry the operation after correcting any configuration files.

125 An internal error occurred in a Front-end Processor request to the device driver. An attempt to send or receive more than 64K bytes of data was submitted. Contact your IBM Service Representative.

128 An error occurred while attempting to send a deallocate connection request to the host. Restart your system before trying to reconnect this connection.

132 An error occurred while deallocating the CLAW connection. Restart the system before attempting to reconnect this connection.

134 The connection was ended normally. This is usually caused by the host being shut down.

136 The CLAW device driver was unable to open the link to the host to which File Services had requested a connection (DEVICE_CLOSED). Probably the system should be restarted to reinitialize the device driver and adapter.

140 The CLAW device driver has detected a problem with the adapter (ADAPTER_FAILURE). Restarting the system may clear up the problem. If the problem persists, contact your IBM Service Representative and report a possible problem in the CLAW channel connection card.

User Response: The return code should give some indication of the nature of the problem. If possible, correct the problem and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3058 Unable to link to server FSD - server went to state *state*. Message from server: *server_text*

Explanation: This message is issued by the NET SERVICE that links the OS/2 LAN Server File System Driver server with the File Services File System Driver server. This service waits for the state of the server, as defined by the NetServiceStatus API call parameters, to reach SERVICE_INSTALLED. If the state of the server does not reach this, message 3058 is issued and the NET SERVICE ends.

The state is one of the states defined in the NetServiceStatus API parameters for Net Services, such as SERVICE_UNINSTALLED. The message text is set by the OS/2 Server process with the NetServiceStatus API parameters. It may be null if the OS/2 Server process did not set a text string into the message area.

User Response: None.

Source: LAN Server

BFS3059 Path from *OLSID*: received late host response. Session timeout was *number* milliseconds; host response time was *number* milliseconds.

Explanation: The session timeout for the client requester software was reached before a response was received from the File Services host.

User Response: The host response is logged, and processing continues.

Increase the client session timeout value to prevent this problem from occurring again.

Source: LAN Server

BFS3061 Unable to open default log file, logging is disabled.

Explanation: When processing the initialization file, a BFS_LOG_FILE record was found. The file path/name of that log file could not be successfully opened, so File Services on the Front-end Processor tried to open the default log file. (The default log file is located in the subdirectory where File Services is installed.) This file could not be opened either, so no logging can be done.

User Response: Make sure the BFS_LOG_FILE record has a correct drive and path and file name, so that the log file can be opened.

Source: LAN Server

BFS3063 Do you want to terminate the File Services Front-end Processor?

Explanation: This is a confirmation prompt that appears when File Services is shut down. The message number does not appear.

User Response: If you really want to stop File Services Front-end Processor processing, answer Yes by clicking on the button, or pressing Enter when the Yes button is selected, or pressing the `Y` key on the keyboard.

If you do not want to stop File Services processing, click on the No button, or press Enter when the No button is selected, or press the `N` key on the keyboard.

Source: LAN Server

BFS3064 Error accessing the shared semaphore with BFSLINK, return code = *number***. The LAN Server or BFSLINK may not be started.**

Explanation: The File Services Front-end Processor allocates a shared semaphore in the BFSLINK module that should be running as a net service of the OS/2 LAN Server. This semaphore is accessed by the BFSSERV.EXE module with the DosOpenSem API call, where the return code from the message is documented. If BFSSERV.EXE cannot access this semaphore, it probably means that the LAN Server or BFSLINK is not started.

User Response: To start the LAN Server, enter NET START SERVER from an OS/2 command prompt, or use the Installed Application folder icon. If the LAN Server is started but BFSLINK is not, enter NET START BFSLINK. (To tell if BFSLINK is started, enter NET START from an OS/2 command line.)

If BFSLINK did not start, you should probably remove and reinstall the File Services Front-end Processor code, because it automatically updates IBMLAN.INI to start the BFSLINK service.

If the BFSLINK service is stopped while the BFSSERV.EXE module (File Services on the Front-end Processor) is running, File Services on the Front-end Processor will be stopped.

Source: LAN Server

BFS3065 Error writing to log file, return code = *return-code***. The log file will be closed.**

Explanation: An error was encountered while writing to the log file. The return code is from the DosWrite or DosFlush API, and can be looked up in the **OS/2 Programming Tools and Information Version 1.3 Manager Macro Assembler/2** manuals.

User Response: The operation of the File Services Front-end Processor should not be affected by the loss of the log file. However, no further tracing can be done, and no other messages will be logged, although they will continue to be shown on the screen of the Front-end Processor. No user response is necessary unless you really want to generate trace data. In that case, stop File Services on the Front-end Processor, attempt to correct the situation described by the API return code, and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3067 Disk full condition while writing *filename***. The log file will be closed.**

Explanation: An error was encountered while writing to the log file. The return code from the write or flush operation was 0, but the number of bytes written to disk was less than it should have been, indicating a disk full condition.

User Response: The operation of File Services on the Front-end Processor should not be affected by the loss of the log file. However, no further tracing can be done, and no other messages will be logged, although they will continue to be shown on the screen of the Front-end Processor. No user response is necessary unless you really want to generate trace data. In that case, stop File Services on the Front-end Processor, clear some disk space, and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3068 The inbound path from *resource* **has not been severed from the send side. The host may be unable to respond. This application cannot completely shut down until these paths are severed.**

Explanation: When File Services on the Front-end Processor is shut down, the communication paths to and from the host computer must be severed. The host computer must sever the communication paths on which it sends data to the Front-end Processor. If the host is unable to sever these paths, then File Services on the Front-end Processor will realize that the host is not responding and will issue this message. (For instance, on a VM system, this condition can occur when the virtual machine running the File Services server is in CP READ state.)

User Response: Contact host systems administration personnel, and inform them that you have shut down your Front-end Processor and that the host does not appear to be releasing its outbound communications paths.

Source: LAN Server

BFS3070 Error in Ring 0 call to *subroutine***, return code =** *number***.**

Explanation: An error occurred in the File Services FSD while attempting to call the named subroutine. The subroutines have meaning as follows:

LockVirt2 This subroutine attempts to do a DevHlp_ProcessToGlobal and a DevHlp_VMLock call. One of these calls failed. This indicates a problem with the memory management subsystem of your OS/2 system. Probably there is too much memory in use in the system at the present time.

User Response: See the User Response for message 3003.

Source: LAN Server

BFS3071 Error in Ring 0 DevHlp call *routine*, return code = *number*.

Explanation: An error occurred in the File Services FSD while attempting to issue the named DevHlp call. The return code is the return code from the DevHlp call, and can be looked up in the **OS/2 Programming Tools and Information Version 1.3 Manager Macro Assembler/2** manuals.

User Response: If possible, correct the problem indicated by the error code and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3072 CLAWFLIP.C internal error, cfa_smb16 = 0, length *number*, message *number*.

Explanation: This message indicates that an internal LFS LAN File Services error occurred while tracing SMBs on the File Services front-end processor over a CLAW connection. Processing will continue. However, this probably indicates that an SMB that should have been included in the trace has not been.

User Response: No action is necessary, as processing will continue. You may wish to notify your IBM Service Representative that this has occurred.

Source: LAN Server

BFS3073 Error in API call WinCreateHelpInstance, return code = *number*. No Help will be available.

Explanation: While attempting to set up Help for File Services on the Front End Processor, an error occurred in the named API call. The most usual occurrence is that the LFSESA.HLP file is not in an accessible directory. The return code from the API indicates what the problem is, and can be looked up in the **OS/2 Programming Tools and Information Version 1.3 Manager Macro Assembler/2** manuals.

Source: LAN Server

System Action: File Services on the Front-end Processor will continue to attempt to initialize, but no help will be available for messages or other subjects. Message boxes will appear with no `Help` button.

User Response: If possible, correct the problem indicated by the return code from WinCreateHelpInstance. Restart File Services on the Front-end Processor.

BFS3074 Line *number*: Value of *keyword* keyword must be between *lower_bound* and *upper_bound*, or *alternative_value*.

Explanation: In the configuration file, the value of the specified keyword must be either:

- A numeric value between the specified lower and upper bounds (inclusive).
- The specified alternative value.

Numbers outside the range or any values which are not numeric are not accepted.

User Response: Correct the configuration file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3075 BFSSERV has already been started on this machine.

Explanation: File Services Front-end Processor code (BFSSERV) can be started only once on any workstation. It is already running in some other session.

User Response: None.

Source: LAN Server

BFS3076 No CLAW device driver found to communicate with host resource *name*

Explanation: The File Services initialization file (BFS.INI) contained a CONNECTION = CLAW record, but no channel card device driver was found. To run channel connections to a host server, the channel card must be installed and its device driver installed at start up time with a DEVICE statement in the CONFIG.SYS file. If the connection is by an ESCON adapter (called a New Serial Channel Adapter or NSCA card) to an ESCON channel, the File Services initialization file must contain a DD_NAME = $NSCA record.

User Response: If necessary, install a channel card and device driver. Restart the OS/2 machine and File Services on the Front-end Processor. If there is no channel connection, configure VM PWSCS or Communications Manager/2 APPC communications to the host and use either CONNECTION = PWSCS or CONNECTION = CM/2 in the File Services initialization file.

Source: LAN Server

BFS3077 No receive posted to channel for at least 10 seconds.

Explanation: The LAN Server front-end processor has not issued a receive for data on the channel card to the host for at least 10 seconds. This indicates a problem with the front-end processor code.

User Response: Contact your IBM service representative.

Source: LAN Server

BFS3078 Large buffer shortage - no receive posted to channel for at least 10 seconds.

Explanation: The LAN Server front-end processor has not issued a receive for data on the channel card to the host for at least 10 seconds. In this case, there is an apparent shortage of memory causing the front-end processor to wait for a large (64K) buffer to become available. It is unusual for the front-end processor to have to wait even a small number of full seconds for a large buffer to become available. This indicates a problem with the front-end processor code.

User Response: Making memory available to the LAN Server front-end processor either by installing more memory or reducing cache sizes and/or the amount of memory consumed by other applications may alleviate the problem. Also moving some of the workload to an additional LAN Server front-end processor may be helpful.

Source: LAN Server

BFS3079 Unable to open device driver *name*, return code = *number*.

Explanation: This message is issued by MMCSTRT during startup time. The named device driver is the channel card device driver. MMCSTRT encountered an error trying to open the device driver with the DosOpen API. The return codes of this message are those of the DosOpen API and can be looked up in the **OS/2 Programming Tools and Information** manuals.

User Response: If possible, correct the situation indicated by the DosOpen return code and restart (reboot) the Front-end Processor.

Source: LAN Server

BFS3080 Unable to do *operation* to channel driver, return code = *return-code*.

Explanation: This message is issued by MMCSTRT during startup time. For CLAW communications over a channel card, MMCSTRT does a series of API calls, including DosDevIOCtl and DosDevIOCtl2 to the device driver. This message indicates that one of those API calls failed. The return code indicates an internal error.

User Response: Contact your IBM Service Representative.

Source: LAN Server

BFS3081 Session cleanup list is full. Sends to host may not be completing.

Explanation: The most likely cause of the error condition is a problem with the communication channel between the front-end processor and the host.

User Response: Reset the communications channel.

Source: LAN Server

BFS3082 Line *number*: *keyword* keyword found before *keyword* keyword and ignored.

Explanation: When parsing the File Services initialization file, the first specified keyword is valid only after the second. This record is ignored.

User Response: Correct the initialization file and restart File Services on the Front-end Processor.

Source: LAN Server

BFS3083 Path from %1: Cache subsystem terminating. Class %2, return code %3.

Explanation: The Front-end Processor detected an error in the cache subsystem. The cache subsystem has been terminated. LAN Server continues to run with FEP caching disabled. %1 is a resource name, %2 and %3 are numbers.

User Response: Record the error information and report the problem to your service representative.

Source: LAN Server

BFS3085 Unable to allocate memory for message handler thread.

Explanation: File Services was unable to allocate memory for starting a thread to handle the LANMSG command. LANMSG messages will not be forwarded to users of this Front End Processor.

User Response: See the User Response for message 3003.

Source: LAN Server

BFS3086 Unable to start message handler thread.

Explanation: File Services was unable to start an OS/2 thread (by _beginthread) to handle the LANMSG command. LANMSG messages will not be forwarded to users of this Front End Processor.

User Response: This may signify either a memory shortage or a limit on the number of threads that are running. For memory problems, see the User Response for message 3003. For thread limitations, increase the value on the THREADS record in the CONFIG.SYS file. Reboot the machine and restart File Services on the Front End Processor.

Source: LAN Server

BFS3087 No DOS Queue and/or process available for message passing to LAN users.

Explanation: File Services on the Front-end Processor was unable to set up a detached second process to handle the LANMSG command. No LANMSG messages will be passed to users of this Front-end Processor.

User Response: See the User Response for message 3086.

Source: LAN Server

BFS3088 LANMSG handler process failure, termination code *number*, result code *number*

Explanation: If the process for handling LANMSG messages ends abnormally, this message is displayed by File Services. The possible return codes and meanings are:

1 Unable to create the Queue for passing messages between BFSSERV and the handler process (BFSLNMSG).

2 Unable to open the synchronization semaphore between BFSSERV and BFSLNMSG (using DosOpenSem).

User Response: The probability of a naming conflict of the queue or the semaphore is low, so probably this is a memory shortage problem. See the User Response for message 3003.

Source: LAN Server

BFS3089 LANMSG message handler (BFSLNMSG) ready.

Explanation: Informational message - the message handler detached process is ready to go.

User Response: None.

Source: LAN Server

BFS3090 Unable to start Cache Scavenger thread, Caching will be disabled.

Explanation: When CACHING = ON is specified in the initialization file, an OS/2 thread is started to flush lazy-written buffers to the host. File Services was unable to start this scavenger thread. Without this scavenger thread, caching on the Front-end Processor must be disabled.

User Response: See the User Response for message 3086.

Source: LAN Server

BFS3091 Unable to allocate memory for the Cache Scavenger thread. Caching will be disabled.

Explanation: When CACHING = ON is specified in the initialization file, a special thread is started to flush lazy-written buffers to the host. File Services was unable to allocate memory for this scavenger thread. Without this memory, caching on the Front-end Processor must be disabled.

User Response: See the User Response for message 3003.

Source: LAN Server

BFS3092 Cache Scavenger unable to allocate a workbuffer. Caching will be disabled.

Explanation: When CACHING = ON is specified in the initialization file, a special private thread is started to flush cache buffers containing data that has not yet been written to disk to the host. File Services was unable to allocate memory through a device driver call (physical memory) for this thread, which is called a scavenger because it effectively comes around and cleans up things that have not yet been written to disk. Without this memory, caching on the Front-end Processor must be disabled.

User Response: See the User Response for message 3003.

Source: LAN Server

BFS3093 No FSD resources available to start Cache Scavenger. Caching will be disabled.

Explanation: When CACHING = ON is specified in the initialization file, a special private thread is started to flush cache buffers containing data that has not yet been written to disk to the host. File Services was unable to start this special thread (not an OS/2 thread but a private executable unit within File Services). This should happen only if the OS/2 LAN Server was tremendously busy when File Services was started. Without this scavenger thread, caching on the Front-end Processor must be disabled.

User Response: Try restarting the server and starting File Services before the server gets too busy handling requests for HPFS resources.

Source: LAN Server

BFS3094 Thread *number* **re-initialized for inbound communications from resource** *resource* **(***number* **retries).**

Explanation: When connections to a File Services host are in error or are lost, this message is issued when the connection is successfully retried. The number of retries tells how many times the connection was unsuccessfully retried. This message is written only to the log file (if a BFS_LOG_FILE is specified in the File Services initialization file).

User Response: None.

Source: LAN Server

BFS3095 Thread *number* **re-initialized for outbound communications to resource** *resource***.**

Explanation: When connections to a File Services host are unsuccessful or are lost, this message is issued when the connection is retried. This message is written only to the log file (if a BFS_LOG_FILE is specified in the File Services initialization file).

User Response: None.

Source: LAN Server

BFS3096 Thread *number* **re-initializing for CLAW connection to resource** *resource* **(***number* **retries).**

Explanation: When connections to a File Services host fail or are lost, this message is issued when the connection is successfully reestablished (if the connection is through CLAW). The number of retries is the number of times the connection was attempted unsuccessfully before being established. This message is written only to the log file (if a BFS_LOG_FILE is specified in the File Services initialization file).

User Response: None.

Source: LAN Server

BFS3097 CLAW connection to resource *resource* **was never initialized.**

Explanation: File Services never attempted to initialize the specified CLAW connection because of an error allocating internal control blocks or buffers.

User Response: See the User Response for message 3003.

Source: LAN Server

BFS3099 Front-end Processor *name* **has been denied access to the File Services host** *olsid* **by the Software License Monitor.**

Explanation: The Software License Monitor product monitoring connections to the named resource does not recognize the Front-end Processor name as authorized to connect to the named host resource. The connection is ended.

User Response: Contact host systems administration personnel, to identify and authorize the Front-end Processor with the Software License Monitor. Restart File Services on the Front-end Processor.

Source: LAN Server

BFS3100 Incompatible product levels. *Product* **is back-level.**

Explanation: File Services on the Front-end Processor was not able to initialize because of a mismatch of product levels. Processing stops.

User Response: Install the LFS/ESA workstation code again. If the problem continues, contact your IBM Service Representative.

Source: LAN Server

BFS3101 Error in File Services initialization, return code = *return-code*

Explanation: File Services on the Front-end Processor was not able to initialize, because of some internal error condition. The return code is for debugging by service personnel.

User Response: In some cases, restarting (rebooting) the machine and retrying will clear up the problem. If it persists, contact your IBM Service Representative.

Return codes 5,6,7,8,9,10,11 and 32 indicate that the FEP failed to allocate storage during initialization. For return code 10, the FEP was attempting to allocate storage below the 16M line. Review the section of *OS/390 LAN Server Installation Guide* that discusses FEP storage allocation.

Source: LAN Server

BFS3102 Line *number*. Found *keyword* keyword. This File Services version is for *connectivity* communications.

Explanation: File Services on the front-end processor found a DD NAME= record in the configuration file. This implies CLAW connectivity. However, the installed version of File Services does not work over a CLAW connection. Different versions of File Services handle different connectivity types (CLAW, PWSCS, CM/2).

User Response: Use the File Services installation *Modify* option to install the correct version of the File Services code for the connectivity you want to use.

Source: LAN Server

BFS3103 Line *number.* Found *keyword=value*. This File Services version is for *connectivity* communications.

Explanation: The File Services on the front-end processor found a CONNECTION= record in the configuration file that specified a connectivity type (CLAW, PWSCS, or CM/2) that the installed version of File Services cannot handle. There are different versions of File Services that handle different connectivity types.

User Response: Use the File Services installation *Modify* option to install the correct version of the File Services code for the connectivity you want to use.

Source: LAN Server

BFS3105 There is not enough memory to load the LFS/ESA FSD.

Explanation: There is not sufficient memory on the workstation to load the File Services File System Driver.

User Response: See the user response under message BFS3003.

Source: LAN Server

BFS3107 The /Cache syntax is not valid.

Explanation: The IFS= statement in CONFIG.SYS for the File Services File System Driver contains a /Cache flag. The syntax of this flag is /C:<number> where <number> is a decimal value greater than or equal to 256 and is the number of kilobytes of storage to use for caching space on the front-end processor

Note that this caching space is in addition to any specified for the LAN Server HPFS386 FSD.

User Response: Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3108 The /Heap syntax is not valid.

Explanation: The IFS= statement in CONFIG.SYS for the File Services File System Driver contains a /Heap flag. The syntax of this flag is /H:<number> where <number> is a decimal value greater than or equal to 64 and is the number of kilobytes of storage to use for heap space on the front-end processor.

Note that this heap space is in addition to any specified for the LAN Server HPFS386 FSD.

User Response: Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3109 Cached Write was unable to complete due to Client session time-out.

Explanation: A write operation to flush a file from the FEP cache failed due to a client's session timeout. The file may not be completely flushed to the host dataset.

User Response: This problem may be due to a network problem, a host performance problem, or a client's SESSTIMEOUT value set too low. If a known problem does not exist, call the next level of support.

Source: LAN Server

BFS3110 Cached Write was unable to complete due to a full host disk.

Explanation: A write operation to flush a file from the FEP cache failed because the host disk is full. An error is returned to the client.

User Response: Increase the size of the host dataset.

Source: LAN Server

BFS3114 The cache size specified is too small. The minimum size of 256KB will be used.

Explanation: The IFS= statement in CONFIG.SYS for the File Services File System Driver contains a /Cache flag. The syntax of this flag is /C:<number> where <number> is a decimal value greater than or equal to 256 and is the number of kilobytes of storage to use for caching space on the front-end processor.

Note that this caching space is in addition to any specified for the LAN Server HPFS386 FSD.

User Response: Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3115 The cache size specified is too large. 50% of available memory will be used.

Explanation: The IFS= statement in CONFIG.SYS for the File Services File System Driver contains a /Cache flag. The syntax of this flag is /C:<number> where <number> is a decimal value greater than or equal to 256 and is the number of kilobytes of storage to use for caching space on the front-end processor.

However, the amount of cache specified must not be too large to cause memory shortages for the rest of the system. In this case, the size specified will cause a memory shortage in the system. File Services allocated 50% of the currently available memory for cache, instead.

Note that this caching space is in addition to any specified for the LAN Server HPFS386 FSD.

User Response: Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3116 The cache size specified is too large. 20% of available memory will be used.

Explanation: The IFS= statement in CONFIG.SYS for the File Services File System Driver contains a /Cache flag. The syntax of this flag is /C:<number> where <number> is a decimal value greater than or equal to 256 and is the number of kilobytes of storage to use for caching space on the front-end processor.

However, the amount of cache specified must not be too large to cause memory shortages for the rest of the system. In this case, the size specified will cause a memory shortage in the system. File Ser-

vices allocated 20% of the currently available memory for cache, instead.

Note that this caching space is in addition to any specified for the LAN Server HPFS386 FSD.

User Response: Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3117 The heap size specified is too large. The maximum size of 512KB will be used.

Explanation: The IFS= statement in CONFIG.SYS for the File Services File System Driver contains a /Heap flag. The syntax of this flag is /H:<number> where <number> is a decimal value within the range of 64 to 512 and is the number of kilobytes of storage to use for heap space on the front-end processor.

However, the amount of cache specified must not be too large to cause memory shortages for the rest of the system. In this case, the size specified will cause a memory shortage in the system. File Services allocated 64 Kilobytes of available memory for heap instead.

Note that this heap space is in addition to any specified for the LAN Server HPFS386 FSD.

User Response: Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3118 The heap size specified is too small. The minimum size of 64KB will be used.

Explanation: The IFS= statement in CONFIG.SYS for the File Services File System Driver contains a /Heap flag. The syntax of this flag is /H:<number> where <number> is a decimal value within the range of 64 to 512 and is the number of kilobytes of storage to use for heap space on the front-end processor. The minimum heap size is 64 Kilobytes.

Note that this heap space is in addition to any specified for the LAN Server HPFS386 FSD.

User Response: Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3123 There is not enough memory for the LFS/ESA cache and heap.

Explanation: There is not enough memory in the system to allocate the minimum size cache and heap for File Services.

User Response: Refer to the user response for message BFS3003. Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3126 An option that is not valid is on LFSLDESA.IFS line: *option*

Explanation: An option is not valid on the IFS= statement for File Services in CONFIG.SYS. The option is displayed.

User Response: Correct the entry in CONFIG.SYS and start the system again.

Source: LAN Server

BFS3128 The file system image was not found on your disk. The LFS/ESA FSD could not be located.

Explanation: The LFSESA.386 or LFSESA.IFS file cannot be found on disk. It may be erased, or the IFS= statement in CONFIG.SYS may be pointing to the wrong directory for the file.

User Response: If the IFS= statement in CONFIG.SYS is pointing to the wrong directory, correct the entry in CONFIG.SYS and start the system again. If this is not so, reinstall File Services to get the module back on disk.

Source: LAN Server

BFS3129 The file system image is not valid. The LFS/ESA FSD could not be located.

Explanation: There is a problem with the LFSLDESA.IFS or LFSESA.386 file on disk. This may be the result of a code level mismatch or a bad disk.

User Response: Remove then reinstall the File Services code. If the problem continues, contact your IBM Service Representative.

Source: LAN Server

BFS3130 An unrecoverable error has occurred.

Explanation: An error occurred, and a recovery attempt cannot be made without operator intervention.

User Response: If previous error messages specified a problem, try to correct the problem. If the problem continues, contact your IBM Service Representative.

Source: LAN Server

Messages from LAN Server Code in the NFS Front-end Processor

All messages from the LAN Server NFS Front-end Processor begin with time stamps.

These messages do not have a severity code indicator.

BFS3502 LAN Server communications started.

Explanation: This is an informational message indicating that communications is starting with a LAN Server MVS host to share NFS files.

User Response: None.

Source: LAN Server

BFS3503 Unable to allocate memory.

Explanation: The LAN Server Front-end Processor was unable to reserve memory to hold internal control blocks or buffers.

User Response: Installing more memory on this OS/2 machine may alleviate out-of-storage conditions. Also, stopping other applications that are running on this server, and that reserve memory, will free memory for this machine.

Source: LAN Server

BFS3504 Unable to start a thread.

Explanation: The LAN Server Front-end Processor is a multi-threaded process. An error was encountered while generating threads. Some threads may already have been generated when the error occurred.

User Response: This problem may be caused by insufficient memory on the server. Try installing more memory or stopping other applications that reserve memory.

Source: LAN Server

BFS3505 Unable to open file *name***.**

Explanation: An error occurred while attempting to open the named file.

User Response: Make sure that the file exists and that the path information for LAN Server is correctly entered to point to the file. This can be from either the PATH environment variable or a path name entered in a configuration file or on a command.

Also, make sure that the limit on concurrently opened files was not exceeded. This limit can be changed by adjusting the FILES record in CONFIG.SYS.

Source: LAN Server

BFS3506 Line *number***: Unknown keyword** *keyword***.**

Explanation: The specified line contains an unknown keyword. This line will be ignored.

User Response: If the configuration file is incorrect:

1. Stop LAN Server on the Front-end Processor.
2. Correct the configuration file.
3. Start LAN Server on the Front-end Processor again.

Source: LAN Server

BFS3507 Line *number***: Syntax error.**

Explanation: Either:

- The specified line is not in the format

  ```
  keyword = value
  ```

  followed by a comment, delimited by a semicolon. Or,
- The value contains characters not allowed for the keyword, such as characters in a number that are not digits.

User Response: Correct the configuration file and start LAN Server on the Front-end Processor again.

Source: LAN Server

BFS3508 Line *number***: Value of** *keyword* **must be** *value* **or** *value***.**

Explanation: The value associated with the specified keyword must be one of the two listed values.

User Response: Correct the configuration file and start LAN Server on the Front-end Processor again.

Source: LAN Server

BFS3509 Line *number***: Value of** *keyword* **must be between** *number* **and** *number***.**

Explanation: The value associated with the specified keyword must be within the specified range (inclusive).

User Response: Correct the configuration file and start LAN Server on the Front-end Processor again.

Source: LAN Server

BFS3510 Line *number***: Duplicate** *keyword* **value** *value* **found and ignored.**

Explanation: While processing the configuration file, a duplicate value for the specified keyword was found. This duplicate information is ignored.

User Response: If the configuration file is incorrect, correct it, and then start LAN Server on the Front-end Processor again.

Source: LAN Server

BFS3511 Error in API call *name***, return code =** *return-code***.**

Explanation: This message indicates an error in the specified API call. The return code is that of the API call, which may be found in the *OS/2 WARP Control Program Programming Reference* volume I, II or III.

User Response: If possible, correct the condition specified by the return code. Then, start LAN Server on the Front-end Processor again.

Source: LAN Server

BFS3512 Unable to open default log file. Logging is disabled.

Explanation: When processing the initialization file, a BFS_LOG_FILE record was found. The file path or name of that log file could not be opened successfully, so LAN Server on the Front-end Processor tried to open the default log file. The default log file is located in the subdirectory where LAN Server is installed. This file cannot be opened either, so no logging can be done.

User Response: Make sure that the BFS_LOG_FILE record has a correct drive, path, and file name, so that the log file can be opened.

Source: LAN Server

BFS3513 The host managing NFSID *nfsid* **is not responding.**

Explanation: The LAN Server Front-end Processor was not able to establish a communications session to the LAN Server MVS host server managing the specified NFSID.

User Response: Ensure that the Start command was entered on the host server to start the communications link.

If the NFS Front-end Processor continues to display this message, ensure that the communications hardware and software between the NFS Front-end Processor and the LAN Server MVS host server are operational and correctly configured.

Source: LAN Server

System Action: The NFS Front-end Processor will try to establish a session to this MVS host server after the RETRY_WAIT_TIME specified in the configuration file has elapsed. The NFS Front-end Processor will continue to try the session after every RETRY_WAIT_TIME interval, until it is shut down.

BFS3514 Error in API call WinCreateHelpInstance, return code = *number***. No Help will be available.**

Explanation: While attempting to set up Help for LAN Server on the Front-end Processor, an error occurred in the named API call. The BFSNFS.HLP file may not be an accessible directory. The return code from the API specifies what the problem is, and can be found in the *OS/2 WARP Control Program Programming Reference* Volume I, II, or III.

Source: LAN Server

System Action: LAN Server on the Front-end Processor will continue to attempt to initialize, but no help will be available.

User Response: If possible, correct the problem specified by the return code from WinCreateHelpInstance. Then, start LAN Server on the Front-end Processor again.

BFS3515 Unable to open device driver *name***, return code =** *number***.**

Explanation: This message is issued during startup time. The named device driver is the channel adapter device driver. The NFS Front End Processor received an error trying to open the device driver with the DosOpen API. The return codes of this message are those of the DosOpen API and can be found in the OS/2 Control Program Guide and Reference Volume 1, 2, or 3.

User Response: Make sure that the device driver is configured correctly in the CONFIG.SYS file. If possible, correct the error specified by the DosOpen return code and start the LAN Server Front-end Processor again.

Source: LAN Server

BFS3516 Unable to do *operation* **to channel driver, return code =** *return-code***.**

Explanation: This message is issued by the Front-end Processor when attempting to communicate to the host server over the channel adapter. This message usually specifies that the link to the host server is no longer active or was not started.

User Response: Ensure that the host server is running and that the channel link started (via the Start command). If this condition continues with the host server active and configured correctly, contact your IBM Service representative.

Source: LAN Server

BFS3517 NFS Front-end Processor *name* **was denied access to the LAN Server host** *nfsid* **by the Software License Monitor.**

Explanation: The Software License Monitor product monitoring connections to the named resource does not recognize the NFS Front-end Processor name as authorized to connect to the named host resource. The connection is ended.

User Response: Contact host systems administration personnel to identify and authorize the NFS Front-end Processor with the Software License Monitor. Then, start LAN Server on the Front-end Processor again.

Source: LAN Server

BFS3518 Extraneous parameters ignored.

Explanation: When the command was entered to start the LAN Server Front-end Processor, additional data was provided with the configuration file name and the log file name. The configuration file name and the log file name are the only two parameters allowed when starting the NFS Front-end Processor. The extra parameters are ignored.

User Response: The next time you start the LAN Server Front-end Processor, be sure to provide only two parameters; the configuration file name and the log file name. For example, you may enter BFSNFS MYNFS.INI MYNFS.LOG to start LAN Server with a configuration file named MYNFS.INI and a log file named MYNFS.LOG.

Source: LAN Server

BFS3519 No route specified to any host server.

Explanation: No NFSID records were found in the supplied configuration file, BFSNFS.INI by default. The NFSID record specifies which LAN Server MVS host file server this NFS Front-end Processor should communicate with.

User Response: Edit the configuration file and provide at least one NFSID record for the LAN Server host for this Front-end Processor to communicate with.

Source: LAN Server

BFS3520 LAN Server is shutting down.

Explanation: Shutdown of the LAN Server Front-end Processor was requested by the user.

Source: LAN Server

BFS3521 Line *number***: Value for** *keyword* **is not a valid IP address.**

Explanation: In processing the configuration file, a keyword was found that requires a valid IP address as its argument. The IP address provided was not in the format of a valid IP address.

User Response: Correct the entry in the configuration file and start LAN Server on the Front-end Processor again.

Source: LAN Server

BFS3522 Attempting to initialize *host* **communications.**

Explanation: The LAN Server Front-end Processor is attempting to communicate with a LAN Server MVS host server. If the host is not currently available, the Front-end Processor will try the communications link periodically.

User Response: The RETRY_WAIT_TIME in the configuration file determines how often the NFS Front-end Processor attempts to establish communications with the LAN Server MVS host.

Source: LAN Server

BFS3523 LAN Server is initialized and ready.

Explanation: The LAN Server Front-end Processor completed initialization, established communications with the LAN Server MVS host server, and is ready to process NFS client requests.

Source: LAN Server

BFS3524 Line *number*: Value for *keyword* keyword must consist of characters A-Z, 0-9, and #,$,@ only.

Explanation: In processing the configuration file, an incorrect value was found for the specified keyword.

User Response: Edit the configuration file entry for the keyword and change the value to the valid characters.

Source: LAN Server

BFS3525 Negotiate Protocol failed to *host* with reply status *rstatus*, accept status *astatus*, procedure status *pstatus*.

Explanation: During LAN Server Front-end Processor initialization, a negotiate protocol command was sent to the LAN Server MVS host. A communications session between the Front-end Processor and the host cannot be established because the negotiate protocol was not successful.

User Response: Call IBM Service with the values and return codes included in this message.

Source: LAN Server

BFS3526 Too many host connections specified.

Explanation: There were more than eight NFSID records specified in the configuration file. One LAN Server Front-end Processor can connect to a maximum of eight LAN Server MVS host systems. Any NFSID record after the eighth one is ignored. NFS Front-end Processor processing continues.

User Response: Make sure that no more than eight NFSID records are specified in the configuration file.

Source: LAN Server

BFS3527 No Front-end Processor name was specified in the configuration file.

Explanation: No FEP_NAME record was found in the configuration file. This record is required and used by the LAN Server MVS host server to identify which Front-end Processor to communicate with.

User Response: Edit the configuration file and add a FEP_NAME record with the correct name to identify this LAN Server Front-end Processor.

Source: LAN Server

BFS3528 Logging started at *timestamp*.

Explanation: This is an informational message that specifies the time and date when the NFS Front-end Processor was started. It is written to the log file when the LAN Server Front-end Processor is initialized.

Source: LAN Server

BFS3529 Exception *number* in module *name* at *address*, origin *address*.

Explanation: An unrecoverable error has occurred in the LAN Server Front End Processor. All communication with NFS clients and the host server are ended. No recovery attempt is possible. Another message will follow with additional information.

User Response: Contact your IBM Service Representative.

Source: LAN Server

BFS3530 Additional exception Data1=*number* Data2=*address*.

Explanation: This message follows a previous message and contains additional data describing the unrecoverable error.

User Response: Contact your IBM Service Representative.

Source: LAN Server

BFS3531 Temporary shortage of *buffer-type* buffers.

Explanation: The LAN Server Front-end Processor is experiencing a shortage of buffers.

The LAN Server Front-end Processor will free idle user blocks and any of its readahead or RPC buffers to alleviate the problem.

User Response: While this situation is not critical, its repeated occurrence will result in degraded performance. Consider increasing the amount of these buffers or decreasing the size of readahead buffers. Any additional buffers will result in more memory being used by the Front-end Processor.

Source: LAN Server

Messages Without Numbers

These messages do not have a number. Their descriptions are listed alphabetically, according to message text. They are only used at initialization time by the MMC or ESCON adapter card and device driver.

MMC Messages Without Numbers

These messages are used only at initialization time by the MMC card and device driver.

Adapter Command not acknowledged

Explanation: A command was issued to the adapter but was not acknowledged within a reasonable period of time.

Source: LAN Server

Problem Determination: This may be an adapter hardware/software problem, however, it can also be caused by interference from other adapters because of interrupt level conflicts or arbitration level conflicts.

User Response: Check adapter configuration. If it is OK, check the adapter hardware.

Adapter ID *number* in slot *slotnum* is not an MMC.

Explanation: The adapter in the specified slot is not an MMC.

User Response: Replace the card in slot *slotnum* with an MMC.

Adapter number *number* on LINK entry must be 1 or 2.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check to see if you made any changes to the configuration file. Contact your IBM Service Representative.

Allocate Physical failed, Rc = *rc*

Explanation: The device driver attempted to allocate storage to read in either the Licensed Internal Code or the configuration tables and the OS/2 AllocPhys Devhelp failed with return code *return-code*.

User Response: Check the amount of system memory available and the parameters in the CONFIG.SYS file to make sure that storage is not over-committed. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Alloc GDT selector failed, Rc = *rc*

Explanation: The OS/2 AllocGDTSelector Devhelp operation failed with return code *rc*.

Source: LAN Server

Problem Determination: This error should not occur because this is system initialization time. Check for DEVICE= statements in error in the CONFIG.SYS file.

User Response: Check the return code for the OS/2 function and take appropriate action. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Buffer size must be 1024, 2048, 4096, 8192, or 16 384.

Explanation: The receive or transmit buffer length in the MMC configuration file was not a value of 1024, 2048, 4096, 8192, or 16 384.

User Response: Correct the appropriate parameter in the active MMC configuration file. The active file is the parameter on the C1= (or C2=) keyword in the CONFIG.SYS DEVICE= statement for the device driver.

CLAW Node table is full.

Explanation: There are too many configured connections for the CLAW device driver.

User Response: Add another workstation with a device driver to handle the extra connections.

CLAW Resource table is full.

Explanation: There are too many configured connections for the CLAW device driver.

User Response: Add another workstation with a device driver to handle the extra connections.

Error attempting to queue an adapter command.

Explanation: The device driver attempted to place a command in the SU-to-adapter command FIFO and found that the FIFO was full.

Source: LAN Server

Problem Determination: This problem should not occur because the FIFO is 256 elements long and the initialization routine always waits for each command to be accepted and acknowledged before issuing the next one.

User Response: If the problem persists, contact your IBM Service Representative.

Error dequeuing an adapter response queue element.

Explanation: The device driver was interrupted by the adapter, but when the initialization code attempted to get the response queue element associated with the interrupt, there was none.

Source: LAN Server

Problem Determination: This may be caused by an interrupt response from the adapter Licensed Internal Code, which the device driver is not programmed to handle.

User Response: If the problem persists, check the adapter hardware. If the hardware appears OK, contact your IBM Service Representative.

Error reading device parameter file, Rc = *rc*

Explanation: The OS/2 DosRead failed attempting to read the file specified by the Cx= parameter on the DEVICE= statement.

User Response: Check the OS/2 return code and the DEVICE= statement to see where the problem is. Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code.

Error reading resource file, Rc = *rc*

Explanation: The OS/2 DosRead failed attempting to read the file specified by the R= parameter on the DEVICE= statement.

User Response: Check the OS/2 return code and the DEVICE= statement to see where the problem is. Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code. Reinstalling File Services may clear this up by placing a fresh copy of the resource file on the disk.

Host name *name* **was not defined by a LINK entry.**

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check the configuration file for errors, correct as necessary and retry. If the problem persists, contact your IBM Service Representative.

If either buffer number is nonzero, then both must be nonzero.

Explanation: The receive or transmit buffer length in the MMC configuration file was not a value of 1024, 2048, 4096, 8192, or 16 384.

User Response: Correct the appropriate parameter in the active MMC configuration file. The active file is the parameter on the C1= (or C2=) keyword in the CONFIG.SYS DEVICE= statement for the device driver.

Invalid parameter spec in DEVICE= statement.

Explanation: One of the parameters on the DEVICE= statement that loads the MMC device driver is incorrect.

User Response: Ensure that the files specified on the DEVICE= line are correct, and that the slot number(s) specified for the installed MMC device driver(s) are correct.

Licensed Internal Code Aborted, Rc = *rc*

Explanation: The adapter Licensed Internal Code aborted with return code *rc*.

Source: LAN Server

Problem Determination: This may be caused by a version mismatch between the adapter ROM and the Licensed Internal Code.

User Response: Replace the Licensed Internal Code. If this does not solve the problem, contact your IBM Service Representative.

Load Control Unit Table failed, RC=*rc***.**

Explanation: A Load Control Unit Table command was issued to the adapter and the command failed. The return code is *return-code*. Return codes are:

X'20' The subchannel is on.

X'25' Incorrect control unit table reference.

X'60' All 63 control unit table slots are already used.

X'61' A table is already loaded and replace was not specified.

X'63' The control unit header is not valid.

X'64' The CRC for the control unit failed.

Source: LAN Server

Problem Determination: This may be caused by incorrect statements in the adapter configuration file specified by the Cx= parameter on the DEVICE= statement.

User Response: Check the configuration file for errors and correct as necessary.

Loading MMC Licensed Internal Code for adapter in slot *slotnum***.**

Explanation: Informational message: loading adapter Licensed Internal Code.

User Response: None.

MMC Device Driver Version *versionnum* **(IDC) now loaded.**

Explanation: Informational message: device driver with IDC interface is loaded, version number is displayed.

User Response: None.

MMC Device Driver Version *versionnum* **now loaded.**

Explanation: Informational message: device driver is loaded, version number is displayed.

User Response: None.

MMC Licensed Internal Code is version *mvnum* **but device driver expects** *ddnum***.**

Explanation: The Software Version of the Licensed Internal Code does not match the compiled code. *mvnum* is the indicated Licensed Internal Code version number. *ddnum* indicates Licensed Internal Code version that the device driver is expecting.

User Response: Replace either the Licensed Internal Code or the device driver to match expected version numbers.

MMC Licensed Internal Code will not indicate ready

Explanation: The device driver loaded the Licensed Internal Code and is now waiting for the adapter ROM to move the code and start it running. However, the Licensed Internal Code did not indicate it initialized within a reasonable amount of time.

Source: LAN Server

Problem Determination: This may be a hardware problem with the adapter card.

User Response: Check the physical positioning of the adapter card and the connections. If the problem persists, contact your IBM Service Representative.

MMC slot *slotnumber* **SRAM at** *address***, INT** *number***, CSEG is** *segmentnumber***, DSEG is** *segment*

Explanation: Informational message

User Response: None.

No MMC adapter has been found in any slot.

Explanation: Although the CLAW device driver is being loaded, there is no MMC card installed.

User Response: Check to make sure the MMC adapter is installed and seated. If there is not supposed to be an adapter, remove the DEVICE= statement from the CONFIG.SYS file.

Phys to GDT selector failed, Rc = *rc*

Explanation: The OS/2 PhystoGDTSelector Devhelp operation failed with return code *return-code*.

User Response: Check the return code. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Phys to user virtual address failed, Rc = *rc*

Explanation: The OS/2 PhystoUVirt Devhelp operation failed with return code *rc*.

Source: LAN Server

Problem Determination: Check the return code for the OS/2 function. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

User Response: Contact your IBM Service Representative.

Phys to Virt failed, Rc = *rc*

Explanation: The OS/2 PhystoVirt Devhelp operation failed with return code *rc*.

Source: LAN Server

Problem Determination: Check the return code for the OS/2 function. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

User Response: Contact your IBM Service Representative.

Resource LINK entry must have 4 parameters.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: You may be able to correct the problem manually by using the LINK and ROUTE descriptions in the NETWORK.CFG file to correct the resource LINK entry. If the problem persists, contact your IBM Service Representative.

Resource *name* has already been defined.

Explanation: There is a duplicate resource name defined.

User Response: Correct the NETWORK.CFG file to remove the duplicate resource. If there is still a problem, contact your IBM Service Representative.

Resource ROUTE entry must have 2 parameters.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: You may be able to correct the problem manually by using the LINK and ROUTE descriptions in the NETWORK.CFG file to correct the resource LINK entry. If the problem persists, contact your IBM Service Representative.

Resource table entries are out of order.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: You may be able to correct the problem manually by using the LINK and ROUTE descriptions in the NETWORK.CFG file to correct the resource LINK entry. If the problem persists, contact your IBM Service Representative.

Route entry found before Link entry.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: You may be able to correct the problem manually by using the LINK and ROUTE descriptions in the NETWORK.CFG file to correct the resource LINK entry. If the problem persists, contact your IBM Service Representative.

Set Adapter Parameter failed, RC=*rc*.

Explanation: A Set Adapter Parameter command was issued to the adapter and the command failed. The return code is *return-code*. Return codes are:

X'20' The subchannel is on.

X'23' The number of subchannels defined is greater than 256.

X'25' Incorrect control unit table reference.

X'40' The buffer size and counts are already defined.

X'41' The transmit buffer size was not valid.

X'43' The amount of memory needed for specified buffer counts and sizes was more than what is available.

Source: LAN Server

Problem Determination: This may be caused by incorrect statements in the adapter configuration file specified by the Cx= parameter on the DEVICE= statement.

User Response: Check the configuration file for errors and correct as necessary.

Subchannel base *channelnumber* on LINK entry is not valid.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check to see if you have made any changes to the configuration file. Contact your IBM Service Representative.

Subchannel pair on LINK entry are not available.

Explanation: There is a problem between what the physical connection actually is and the definition between the Front-end Processor and host.

User Response: Contact your host system administrator to find out what host subchannels to use. Correct the configuration with the correct host subchannels in the PSCAn.CFG file(s).

The adapter in slot *slotnumber* has shared RAM above 16 Meg.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check to see if you have made any changes to the configuration file. Contact your IBM Service Representative.

The adapter in slot *slotnumber* is version *version*.

Explanation: Informational message: The version of the adapter in *slotnumber* is *version*.

User Response: None.

The Licensed Internal Code for the MMC adapter is *versionnum*

Explanation: Informational message: the Licensed Internal Code is loaded, the version number is displayed.

User Response: None.

The MMC card does not complete POST.

Explanation: The adapter ROM has not completed Power On Self Test within a reasonable period of time.

Source: LAN Server

Problem Determination: This is usually a hardware problem with the adapter card.

User Response: Check the physical positioning of the adapter card and the connections. If the problem persists, contact your IBM Service Representative.

There is no adapter in slot *number*.

Explanation: There is no adapter in specified slot. This is from the S1 or S2 parameter on the DEVICE= statement in the CONFIG.SYS file.

User Response: Either install an adapter (MMC) in slot number *number*, or correct the slot number specification to reflect the slot in use.

Unable to gain access to Shared Ram

Explanation: The procedure to gain addressability to the adapter Shared Ram failed. Either the OS/2 Allocate GDT or the OS/2 Physical to GDT failed.

User Response: Check the previous message to determine the exact cause of the problem.

Unable to initiate MMC card, Rc = *rc*

Explanation: Either the Licensed Internal Code has aborted or the OS/2 PhysToVirt Devhelp operation failed.

Source: LAN Server

Problem Determination: If the return code is -1, then the Licensed Internal Code aborted, and another message preceded this message. Otherwise, the return code is what was returned by the PhysToVirt. If the Licensed Internal Code aborted, the problem most probably is a version mismatch between the adapter and the Licensed Internal Code.

User Response: Check the type of error. If it is a Licensed Internal Code abort, check the adapter EPROM level against the Licensed Internal Code. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Unable to load Licensed Internal Code.

Explanation: Unable to successfully load the Licensed Internal Code.

User Response: Replace the MMC Licensed Internal Code file (specified in the M= line in the CONFIG.SYS DEVICE= statement for the MMC device driver).

Unable to open control unit decode file, Rc = *rc*

Explanation: The OS/2 DosOpen failed attempting to open one of the control unit decode files in the configuration file specified by the Cx= parameter on the DEVICE= statement.

User Response: Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code.

Unable to open driver configuration file, Rc = *rc*

Explanation: Unable to open the configuration file. *rc* = DosOpen API return code.

User Response: Install the configuration file(s) specified in the C1= (and C2=) parameters on the CONFIG.SYS DEVICE= statement for the MMC device driver. Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code.

Unable to open Licensed Internal Code file, Rc = *rc*

Explanation: Unable to open the Licensed Internal Code file. *rc* = DosOpen API return code.

User Response: Install the file specified in the M= line in the CONFIG.SYS DEVICE= statement for the MMC device driver in the correct path. Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code.

Unable to register interrupt handler, Rc = *rc*

Explanation: The OS/2 SetIRQ Devhelp operation failed with return code *rc*.

Source: LAN Server

Problem Determination: This may be caused because there is another adapter configured with the same interrupt address.

User Response: Check the configuration and make sure there are no other adapters with the same interrupt level. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Unable to set MMC parameters.

Explanation: Internal Error.

User Response: Contact your IBM Service Representative.

Unknown device parameter spec *stmt***.**

Explanation: A statement *stmt* in the configuration file is not recognized.

User Response: Remove the indicated record from the configuration file.

Unknown entry *entrystring* **found in resource file.**

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check the configuration file for errors and correct as necessary. If the problem persists, contact your IBM Service Representative.

Source: LAN Server

ESCON Adapter Messages Without Prefixes

These messages are used only at initialization time by the ESCON adapter card and device driver.

Adapter Command not acknowledged

Explanation: A command was issued to the adapter but was not acknowledged within a reasonable period of time.

Source: LAN Server

Problem Determination: This may be caused by an adapter hardware or software problem. Or, it may be caused by interference from other adapters because of interrupt level conflicts or arbitration level conflicts.

User Response: Check adapter configuration. If it is OK, check the adapter hardware.

Adapter ID *number* **in slot** *slotnum* **is not an ESCON adapter.**

Explanation: The adapter in the specified slot is not an ESCON adapter.

User Response: Replace the card in slot *slotnum* with an ESCON adapter.

Adapter number *number* **on LINK entry must be 1 or 2.**

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check to see if you have made any changes to the configuration file. Contact your IBM Service Representative.

Allocate Physical failed, Rc = *rc*

Explanation: The device driver attempted to allocate storage to read in either the Licensed Internal Code or the configuration tables and the OS/2 AllocPhys Devhelp failed with return code *return-code*.

User Response: Check the amount of system memory available and the parameters in the CONFIG.SYS file to make sure that storage was not over-committed. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Alloc GDT selector failed, Rc = *rc*

Explanation: The OS/2 AllocGDTSelector Devhelp operation failed with return code *rc*.

Source: LAN Server

Problem Determination: This error should not occur because this is system initialization time. Check for DEVICE= statements in error in the CONFIG.SYS file.

User Response: Check the return code for the OS/2 function and take appropriate action. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Buffer size must be 1024, 2048, 4096, 8192, or 16 384.

Explanation: The receive or transmit buffer length in the ESCON adapter configuration file was not a value of 1024, 2048, 4096, 8192, or 16 384.

User Response: Correct the appropriate parameter in the active ESCON adapter configuration file. The active file is the parameter on the C1= (or C2=) keyword in the CONFIG.SYS DEVICE= statement for the device driver.

CLAW Node table is full.

Explanation: There are too many configured connections for the CLAW device driver.

User Response: Add another workstation with a device driver to handle the extra connections.

CLAW Resource table is full.

Explanation: There are too many configured connections for the CLAW device driver.

User Response: Add another workstation with a device driver to handle the extra connections.

DosQFileInfo for file *name* **gives error code** *errcode***.**

Explanation: There is a problem with the OS/2 DosQFile Info call.

User Response: Look up the error code in the *OS/2 Control Program Programming Reference*. Reinstall and retry. If the problem persists, contact your IBM Service Representative.

Error attempting to queue a load CU table command.

Explanation: This is an internal failure.

User Response: Contact your IBM Service Representative.

Error attempting to queue a load MCM code command.

Explanation: This is an internal failure.

User Response: Contact your IBM Service Representative.

Error attempting to queue an adapter command.

Explanation: The device driver has attempted to place a command in the SU-to-adapter command FIFO, and the FIFO was full.

Source: LAN Server

Problem Determination: This problem should not occur because the FIFO is 256 elements long and the initialization routine always waits for each command to be accepted and acknowledged before issuing the next one.

User Response: If the problem persists, contact your IBM Service Representative.

Error code *errcode* **from ldfile function.**

Explanation: This is an internal failure.

User Response: Contact your IBM Service Representative.

Error dequeuing a load CU table response queue element.

Explanation: This is an internal failure.

User Response: Contact your IBM Service Representative.

Error dequeuing a load MCM code response queue element.

Explanation: This is an internal failure.

User Response: Contact your IBM Service Representative.

Error dequeuing an adapter response queue element.

Explanation: The device driver was interrupted by the adapter, but when the initialization code attempted to get the response queue element associated with the interrupt, there was none.

Source: LAN Server

Problem Determination: This may be caused by an interrupt response from the adapter Licensed Internal Code, which the device driver is not programmed to handle.

User Response: If the problem persists, check the adapter hardware. If the hardware appears OK, contact your IBM Service Representative.

Error reading device parameter file, Rc = *rc*

Explanation: The OS/2 DosRead failed attempting to read the file specified by the Cx= parameter on the DEVICE= statement.

User Response: Check the OS/2 return code and the DEVICE= statement to see where the problem is. Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code.

Error reading MCM file *filename***, Rc =** *rc***.**

Explanation: There is a problem with the OS/2 DosRead API call.

User Response: Look up the return code in the *OS/2 Control Program Programming Reference*. Reinstall and retry. If the problem persists, contact your IBM Service Representative.

Error reading resource file, Rc = *rc*

Explanation: The OS/2 DosRead failed attempting to read the file specified by the R= parameter on the DEVICE= statement.

User Response: Check the OS/2 return code and the DEVICE= statement to see where the problem lies. Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code. Reinstalling File Services may clear this up by placing a fresh copy of the resource file on the disk.

Host name *name* **was not defined by a LINK entry.**

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check the configuration file for errors, correct as necessary and retry. If the problem persists, contact your IBM Service Representative.

If either buffer number is nonzero, then both must be nonzero.

Explanation: The receive or transmit buffer length in the ESCON adapter configuration file was not a value of 1024, 2048, 4096, 8192, or 16 384.

User Response: Correct the appropriate parameter in the active ESCON adapter configuration file. The active file is the parameter on the C1= (or C2=) keyword in the CONFIG.SYS DEVICE= statement for the device driver.

Invalid parameter spec in DEVICE= statement.

Explanation: One of the parameters on the DEVICE= statement that loads the ESCON adapter device driver is incorrect.

User Response: Ensure that the files specified on the DEVICE= line are correct, and that the slot numbers specified for the installed ESCON adapter device drivers are correct.

Licensed Internal Code Aborted, Rc = *rc*

Explanation: The adapter Licensed Internal Code has stopped with return code *rc*.

Source: LAN Server

Problem Determination: This may be caused by a version mismatch between the adapter ROM and the Licensed Internal Code.

User Response: Replace the Licensed Internal Code. If this does not solve the problem, contact your IBM Service Representative.

Load Control Unit Table failed, RC=*rc***.**

Explanation: A Load Control Unit Table command was issued to the adapter and the command failed. The return code is *return-code*. Return code meanings are:

X'20' The subchannel is on.

X'25' Incorrect control unit table reference.

X'60' All 63 control unit table slots are already used.

X'61' A table was already loaded and replace was not specified.

X'63' The control unit header is not valid.

X'64' The CRC for the control unit failed.

Source: LAN Server

Problem Determination: This may be caused by incorrect statements in the adapter configuration file specified by the Cx= parameter on the DEVICE= statement.

User Response: Check the configuration file for errors and correct as necessary.

Load CU table command not acknowledged.

Explanation: This is an internal failure.

User Response: Contact your IBM Service Representative.

Loading ESCON adapter Licensed Internal Code for adapter in slot *slotnum***.**

Explanation: Informational message: loading adapter Licensed Internal Code.

User Response: None.

Load MCM code command not acknowledged.

Explanation: This is an internal failure.

User Response: Contact your IBM Service Representative.

Load MCM command failed, Rc = *rc***.**

Explanation: This is an internal failure.

User Response: Look up the return code in the *OS/2 Control Program Programming Reference*. Reinstall and retry. If the problem persists, contact your IBM Service Representative.

No ESCON adapter has been found in any slot.

Explanation: Although the CLAW device driver is being loaded, there is no ESCON adapter card installed.

User Response: Check to make sure the ESCON adapter is installed and seated. If there is not supposed to be an adapter, remove the DEVICE= statement from the CONFIG.SYS file.

ESCON adapter Device Driver Version *versionnum* **(IDC) now loaded.**

Explanation: Informational message: device driver with IDC interface is loaded, version number is displayed.

User Response: None.

ESCON adapter Device Driver Version *versionnum* **now loaded.**

Explanation: Informational message: device driver is loaded, version number is displayed.

User Response: None.

ESCON adapter Licensed Internal Code has incorrect length.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Reinstall and retry. If the problem persists, contact your IBM Service Representative.

ESCON adapter Licensed Internal Code has incorrect number of control sections.

Explanation: There is a problem with the Licensed Internal Code.

User Response: Reinstall and retry. If the problem persists, contact your IBM Service Representative.

ESCON adapter Licensed Internal Code is version *mvnum* **but device driver expects** *ddnum***.**

Explanation: The Software Version of the Licensed Internal Code does not match the compiled code. *mvnum* is the indicated Licensed Internal Code version number. *ddnum* indicates Licensed Internal Code version that the device driver is expecting.

User Response: Replace either the Licensed Internal Code or the device driver to match expected version numbers.

ESCON adapter Licensed Internal Code will not indicate ready.

Explanation: The device driver has loaded the Licensed Internal Code and is now waiting for the adapter ROM to move the code and start it running. However, the Licensed Internal Code did not indicate it was initialized within a reasonable amount of time.

Source: LAN Server

Problem Determination: This may be caused by a hardware problem with the adapter card.

User Response: Check the physical positioning of the adapter card and the connections. If the problem persists, contact your IBM Service Representative.

ESCON adapter slot *slotnumber* **SRAM at** *address***, INT** *number***, CSEG is** *segmentnumber***, DSEG is** *segment*

Explanation: Informational message

User Response: None.

Phys to GDT selector failed, Rc = *rc*

Explanation: The OS/2 PhystoGDTSelector Devhelp operation failed with return code *return-code*.

User Response: Check the return code. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Phys to user virtual address failed, Rc = *rc*

Explanation: The OS/2 PhystoUVirt Devhelp operation failed with return code *rc*.

Source: LAN Server

Problem Determination: Check the return code for the OS/2 function. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

User Response: Contact your IBM Service Representative.

Phys to Virt failed on microcode loading.

Explanation: Internal failure.

User Response: Contact your IBM Service Representative.

Phys to Virt failed, Rc = *rc*

Explanation: The OS/2 PhystoVirt Devhelp operation failed with return code *rc*.

Source: LAN Server

Problem Determination: Check the return code for the OS/2 function. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

User Response: Contact your IBM Service Representative.

Resource LINK entry must have 4 parameters.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: You may be able to correct the problem manually by using the LINK and ROUTE descriptions in the NETWORK.CFG file to correct the resource LINK entry. If the problem persists, contact your IBM Service Representative.

Resource *name* **has already been defined.**

Explanation: There is a duplicate resource name defined.

User Response: Correct the NETWORK.CFG file to remove the duplicate resource. If there is still a problem, contact your IBM Service Representative.

Resource ROUTE entry must have 2 parameters.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: You may be able to correct the problem manually by using the LINK and ROUTE descriptions in the NETWORK.CFG file to correct the resource LINK entry. If the problem persists, contact your IBM Service Representative.

Resource table entries are out of order.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: You may be able to correct the problem manually by using the LINK and ROUTE descriptions in the NETWORK.CFG file to correct the resource LINK entry. If the problem persists, contact your IBM Service Representative.

Route entry found before Link entry.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: You may be able to correct the problem manually by using the LINK and ROUTE descriptions in the NETWORK.CFG file to correct the resource LINK entry. If the problem persists, contact your IBM Service Representative.

Serial number not specified in configuration file.

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Reinstall and retry. If the problem persists, contact your IBM Service Representative.

Set Adapter Parameter failed, command=*cc* **RC=***rc***.**

Explanation: A Set Adapter Parameter command was issued to the adapter and the command failed. The return code is *return-code*. Return code meanings are:

X'20' The subchannel is on.

X'23' The number of subchannels defined is greater than 256.

X'25' Incorrect control unit table reference.

X'40' The buffer size and counts are already defined.

X'41' The transmit buffer size was not valid.

X'43' The amount of memory needed for specified buffer counts and sizes was more than what is available.

Source: LAN Server

Problem Determination: This may be caused by incorrect statements in the adapter configuration file specified by the Cx= parameter on the DEVICE= statement.

User Response: Check the configuration file for errors and correct as necessary.

Subchannel base *channelnumber* **on LINK entry is not valid.**

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check to see if you have made any changes to the configuration file. Contact your IBM Service Representative.

Subchannel pair on LINK entry are not available.

Explanation: There is a problem between what the physical connection actually is and the definition between the Front-end Processor and host.

User Response: Contact your host system administrator to find out what host subchannels to use. Correct the configuration with the correct host subchannels in the NSCAn.CFG file(s).

The adapter in slot *slotnumber* **has shared RAM above 16 Meg.**

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check to see if you have made any changes to the configuration file. Contact your IBM Service Representative.

The adapter in slot *slotnumber* **is version** *version***.**

Explanation: Informational message: The version of the adapter in *slotnumber* is *version*.

User Response: None.

The Licensed Internal Code for the ESCON adapter is *versionnum*

Explanation: Informational message: the Licensed Internal Code is loaded, the version number is displayed.

User Response: None.

The MCM constants file *filename* **is not found.**

Explanation: There is a problem locating the NSCAMCM.CON file. This file is named by the N=C:/BFS/NSCAMCM parameter on the DEVICE= statement in the CONFIG.SYS file.

User Response: Reinstall File Services to get the CONFIG.SYS file written correctly and retry. If the problem persists, contact your IBM Service Representative.

The MCM executable file *name* **is not found.**

Explanation: There is a problem locating the NSCAMCM.EXE file. This file is named by the N=C:/BFS/NSCAMCM parameter on the DEVICE= statement in the CONFIG.SYS file.

User Response: Reinstall File Services to get the CONFIG.SYS file written correctly and retry. If the problem persists, contact your IBM Service Representative.

The MCM POR file *filename* **is not found.**

Explanation: There is a problem locating the NSCAMCM.POR file. This file is named by the N=C:/BFS/NSCAMCM parameter on the DEVICE= statement in the CONFIG.SYS file.

User Response: Reinstall File Services to get the CONFIG.SYS file written correctly and retry. If the problem persists, contact your IBM Service Representative.

The ESCON adapter card does not complete POST.

Explanation: The adapter ROM did not complete the Power On Self Test within a reasonable period of time.

Source: LAN Server

Problem Determination: This may be caused by a hardware problem with the adapter card.

User Response: Check the physical positioning of the adapter card and the connections. If the problem persists, contact your IBM Service Representative.

There is no adapter in slot *number***.**

Explanation: There is no adapter in the specified slot. This is from the S1 or S2 parameter on the DEVICE= statement in the CONFIG.SYS file.

User Response: Either install an adapter (ESCON adapter) in slot number *number*, or correct the slot number specification to reflect the slot in use.

Unable to gain access to Shared Ram

Explanation: The procedure to gain addressability to the adapter Shared Ram failed. Either the OS/2 Allocate GDT or the OS/2 Physical to GDT failed.

User Response: Check the previous message to determine the exact cause of the problem.

Unable to initiate ESCON adapter card, Rc = *rc*

Explanation: Either the Licensed Internal Code has aborted or the OS/2 PhysToVirt Devhelp operation failed.

Source: LAN Server

Problem Determination: If the return code is -1, then the Licensed Internal Code aborted, and another message preceded this message. Or, the return code is what was returned by the PhysToVirt. If the Licensed Internal Code ended, the problem may be caused by a version mismatch between the adapter and the Licensed Internal Code.

User Response: Check the type of error. If it is a Licensed Internal Code abend, check the adapter EPROM level against the Licensed Internal Code. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Unable to load Licensed Internal Code.

Explanation: Unable to successfully load the Licensed Internal Code.

User Response: Replace the ESCON adapter Licensed Internal Code file specified in the M= line in the CONFIG.SYS DEVICE= statement for the ESCON adapter device driver.

Unable to open control unit decode file, Rc = *rc*

Explanation: The OS/2 DosOpen failed attempting to open one of the control unit decode files specified in the configuration file specified by the Cx= parameter on the DEVICE= statement.

User Response: Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code.

Unable to open driver configuration file, Rc = *rc*

Explanation: Unable to open the configuration file. *rc* = DosOpen API return code.

User Response: Install the configuration file(s) specified in the C1= (and C2=) parameters on the CONFIG.SYS DEVICE= statement for the ESCON adapter device driver. Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code.

Unable to open Licensed Internal Code file, Rc = *rc*

Explanation: Unable to open the Licensed Internal Code file. *rc* = DosOpen API return code.

User Response: Install the file specified in the M= line in the CONFIG.SYS DEVICE= statement for the ESCON adapter device driver in the correct path. Refer to *OS/2 Control Program Programming Reference* for an explanation of the return code.

Unable to register interrupt handler, Rc = *rc*

Explanation: The OS/2 SetIRQ Devhelp operation failed with return code *rc*.

Source: LAN Server

Problem Determination: This may be caused by another adapter configured with the same interrupt address.

User Response: Check the configuration and make sure there are no other adapters with the same interrupt level. Refer to *OS/2 LAN Server publications* for an explanation of the return code.

Unable to set ESCON adapter parameters.

Explanation: Internal Error.

User Response: Contact your IBM Service Representative.

Unknown device parameter spec *stmt***.**

Explanation: A statement *stmt* in the configuration file is not recognized.

User Response: Remove the specified record from the configuration file.

Unknown entry *entrystring* **found in resource file.**

Explanation: There is a problem using the configuration file. Either the IBM installation had a problem writing the configuration file, or the configuration file was changed manually.

User Response: Check the configuration file for errors and correct as necessary. If the problem persists, contact your IBM Service Representative.

BLS Messages

Additional BLS Messages

See *OS/390 MVS Dump Output Messages* manual for additional messages.

BLS001E UNABLE TO PROCESS SYS1.PARMLIB(BLSCECT) FOR SNAP

Explanation: The system detected an error while processing the BLSCECT parmlib member or any imbedded members.

Source: Interactive problem control system (IPCS)

System Action: SYS1.PROCLIB procedure BLSJPRMI ends. Formatting for ABEND and SNAP dumps will be unable to use the installation exit routines or IBM-supplied support identified by the BLSCECT parmlib member or any imbedded members. For this IPL, SNAP will not be usable. IPL continues.

Operator Response: Notify the system programmer.

System Programmer Response: Add a temporary SYSTSPRT file to SYS1.PROCLIB(BLSJPRMI). The system might send messages that describe the error in more detail. Then ask the operator to restart BLSJPRMI.

BLS002E BLSQPRMI CAN ONLY BE INVOKED FROM A JOB INITIATED BY THE OPERATOR START COMMAND

Explanation: The system program BLSQPRMI was invoked in an environment other than from a job which was initiated by an operator START command. BLSQPRMI can only be invoked from a job initiated by a START command.

Note: The IEACMD00 parmlib member uses the START command to initiate the procedure SYS1.PROCLIB(BLSJPRMI). That procedure runs BLSQPRMI to initialize IPCS formatting tables for ABEND and SNAP dump processing.

Source: Interactive problem control system (IPCS)

System Action: The system ends BLSQPRMI before it updates the IPCS formatting tables for ABEND and SNAP dump processing.

Operator Response: Notify the system programmer.

System Programmer Response: Use the START command to initiate procedure SYS1.PROCLIB(BLSJPRMI).

© Copyright IBM Corp. 1988, 1999

BLW Messages

BLW001I THE FOLLOWING CPUS MAY NOT HAVE BEEN RESTARTED AFTER RESTARTABLE WAIT STATE '*www*'X [REASON '*reason-code*'X]: *cpuid1*[, *cpuid2*, ...]

Explanation: The system could not restart at least one processor after the system entered a restartable wait state and the operator initiated a restart.

In the message text:

www The restartable wait state code.

reason-code The accompanying reason code. If no reason code was specified, this field contains X'0'.

cpuid1, *cpuid2* The central processor(s) that the system could not restart.

Source: Loadwait/Restart

System Action: The system continues processing.

Operator Response: Restart the stopped central processor(s). If you cannot restart the stopped processor(s), reconfigure the the processor(s) offline and configure them back online, using the CONFIG CPU(*x*), ONLINE/OFFLINE command.

BLW002I SYSTEM WAIT STATE X'CCC' QUIESCE FUNCTION PERFORMED

Explanation: The operator entered a QUIESCE command. The system performed the quiesce function.

Source: Loadwait/Restart

Detecting Module: BLWQUIES

System Action: The system enters restartable wait state X'CCC'.

Operator Response: See the operator response for wait state X'CCC'.

BLW003I SYSTEM ERROR ENCOUNTERED DURING QUIESCE

Explanation: The operator entered a QUIESCE command, but the system encountered an error while processing the command.

Source: Loadwait/Restart

System Action: The system does not process the command. The system writes an SVC dump. The system continues processing.

Operator Response: Enter the command again. If the command fails again, notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

BLW004A RESTART INTERRUPT DURING {*jobname* *stepname*|UNKNOWN JOBNAME} ASID=*asid* MODE=*mode* PSW=*pppppppp* SYSTEM NON-DISPATCHABILITY INDICATOR IS {ON|OFF}

[*text*]
REPLY ABEND TO ABEND INTERRUPTED PROGRAM,
RESUME TO RESUME INTERRUPTED PROGRAM,
REPAIR TO PERFORM REPAIR ACTIONS.
[PREVIOUS REPLY WAS INVALID, ENTER A VALID REPLY.]

[*text*] is one or both of the following:
WRITE-TO-OPERATOR BUFFER LIMIT EXCEEDED
ISSUE K M,MLIM COMMAND TO RAISE LIMIT

NO BATCH JOBS OR TIME SHARING USERS FOUND.
RECOMMEND YOU DISPLAY ACTIVE AND DISPLAY QUEUES

Explanation: When the operator caused a restart interruption, the specified job was in progress. The message asks the operator to indicate which of the following the system should do:

- Resume or end the job that was in progress
- Perform repair actions.

In the message text:

jobname The name of the job that the system was currently processing.

stepname The name of the step that the system was currently processing or blanks.

UNKNOWN JOBNAME The system could not identify the current job.

ASID=*asid* The address space identifier (ASID)

MODE=*mode* The system was processing one of the following units of work:

TASK A task

SRB A service request

WAIT The system wait task

***** A unit of work other than those listed above

PSW=*pppppppp* The program status word (PSW) at the time of the restart interruption

SYSTEM NON-DISPATCHABILITY INDICATOR IS {OFF|ON} ON if the address spaces are not dispatchable. OFF if the address spaces are dispatchable.

[PREVIOUS REPLY WAS INVALID, ENTER A VALID REPLY] The operator did not enter a valid reply to a previous instance of this message. The only valid replies to this message are:

- ABEND
- RESUME
- REPAIR

[*text*] *text* can be one or both of the following:

WRITE-TO-OPERATOR BUFFER LIMIT EXCEEDED ISSUE K M,MLIM COMMAND TO RAISE LIMIT. The write to operator (WTO) message buffer is full.

NO BATCH JOBS OR TIME SHARING USERS FOUND. RECOMMEND YOU DISPLAY ACTIVE AND DISPLAY QUEUES. The system found no batch jobs or time sharing users. However, there may be started tasks in the system.

Source: Loadwait/Restart

© Copyright IBM Corp. 1988, 1999

System Action: The system prompts the operator for a reply. If the operator replies **REPAIR** when the non-dispatchability indicator is on, the system sets it off and marks all address spaces as dispatchable.

Operator Response: Do the following:

1. Enter one of the following replies:

   RESUME The job that was in progress continues at the next sequential instruction.

   ABEND The system ends the job with abend X'071'.

   REPAIR The system checks and repairs critical data areas.

2. If you receive one of the texts below, you may do one of the following **only after** replying to message BLW004A:

   WRITE-TO-OPERATOR BUFFER LIMIT EXCEEDED. ISSUE K M,MLIM COMMAND TO RAISE LIMIT
   Enter the CONTROL M,REF command to display the limit. Enter the CONTROL M,MLIM=*nnnn* command to raise the limit.

   NO BATCH JOBS OR TIME SHARING USERS FOUND RECOMMEND YOU DISPLAY ACTIVE AND DISPLAY QUEUES
   Enter the DISPLAY ACTIVE and/or the DISPLAY QUEUE command to determine if the system is holding a job queue.

BLW005I ESTAE COULD NOT BE ESTABLISHED DURING QUIESCE PROCESSING

Explanation: The system could not establish a recovery environment.

Source: Loadwait/Restart

System Action: The system continues processing.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

BLW006W UNRECOVERABLE MACHINE FAILURE, RE-IPL SYSTEM

Explanation: An unrecoverable error occurred. This message accompanies Loadwait/Restart non-restartable, disabled wait state code X'5C7', reason code X'9906'.

Source: Loadwait/Restart

System Action: The system enters disabled, non-restartable wait state X'5C7' with a reason code of X'9906'.

Operator Response: See the operator response for the accompanying wait state X'5C7'.

System Programmer Response: See the system programmer response for the accompanying wait state X'5C7'.

BLW007W MULTIPLE ACR ATTEMPTS BY CPU *id*

Explanation: A hardware error occurred on a processor. The system could not invoke alternate CPU recovery (ACR) because ACR was already in progress on another processor.

In the message text:

id The processor identifier.

Source: Loadwait/Restart

System Action: The system enters disabled wait state X'050'.

Operator Response: See the operator response for wait state X'050'.

BPX Messages

BPXB001E GROUP ID FOR *group_name* CANNOT BE OBTAINED. SAF RETURN CODE = *saf_return_code*, RACF RETURN CODE = *racf_rc*, RACF REASON CODE = *racf_rsn*. TERMINAL GROUP OWNERSHIP WILL NOT BE UPDATED.

Explanation: An error was reported by SAF, RACF or other security product during initialization of OS/390 UNIX pseudoterminal support. The following return and reason codes may be returned:

SAF Return Code	RACF Return Code	RACF Reason Code	Explanation
4	0	0	RACF not installed
8	8	4	No OS/390 UNIX MVS segment found in group's profile
8	8	8	Group name not defined
8	8	12	Internal error during RACF processing
8	8	16	Unable to establish recovery
8	8	20	No GID in group's OS/390 UNIX MVS segment

In the message text:

group_name
The RACF group name associated with opened terminals.

saf_return_code
The error return code from the system authorization facility (SAF).

racf_return_code
The error return code from the resource access control facility (RACF) or other security product.

racf_rsn
The error reason code from the resource access control facility (RACF) or other security product.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXBDCI

System Action: Initialization continues, but the group ownership of terminals will not be updated during open. This will prevent programs such as *talk* from accessing the terminal.

Operator Response: Notify the system programmer or security administrator.

System Programmer Response: If the return and reason codes indicate that the group is not defined, use the RACF ADDGROUP command to add the group. Be sure to include the OMVS operand and to specify a unique GID.

If the group is defined, but does not have an OMVS segment or a GID, use the RACF ALTGROUP command to add this information.

The name used is specified in the TTYGROUP initialization parameter, which defaults to TTY. This group name is used for certain programs, such as *talk*, which run as setgid programs. The name specified should match the group owner of such programs.

For other reason codes, contact the IBM Support Center or support for your security product.

BPXB002E OCS REQUIRES TCP/IP TO BE ACTIVE. START TCP/IP OR HAVE THE SYSTEM ADMINISTRATOR UNCONFIGURE THE OCS NODES.

Explanation: Outboard Communication Server (OCS) received an indication that TCP/IP is not active. TCP/IP is required for OCS to operate.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXBOTBD

System Action: OCS waits for TCP/IP to become active. There may be up to a two-minute delay between TCP/IP activation and OCS node connection.

Operator Response: Either start TCP/IP or have the system administrator shut down OCS by issuing the ocsconfig command to unconfigure all OCS nodes. If TCP/IP is active, notify the system programmer.

System Programmer Response: Verify that the TSO/E command OBEYFILE was issued to cause TCP/IP to read the TCP/IP profile dataset. Verify that the IP address is correct for the OCS node. Issue the TSO/E command PING using the IP address or OCS node name to verify the connection. If the cause of the failure cannot be determined, contact the IBM Support Center.

BPXB003I OCS *text*

Explanation: Outboard Communication Server (OCS) encountered a kernel service failure.

In the message text:

return_code
The return code from the kernel service.

reason_code
The reason code from the kernel service. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

SOCKET KERNEL SERVICE FAILED. RETURN CODE = *return_code*, REASON CODE = *reason_code*.
Indicates that a kernel SOCKET service failed.

BIND KERNEL SERVICE FAILED. RETURN CODE = *return_code*, REASON CODE = *reason_code*.
Indicates that a kernel BIND service failed.

LISTEN KERNEL SERVICE FAILED. RETURN CODE = *return_code*, REASON CODE = *reason_code*.
Indicates that a kernel LISTEN service failed.

ACCEPT KERNEL SERVICE FAILED. RETURN CODE = *return_code*, REASON CODE = *reason_code*.
Indicates that a kernel ACCEPT service failed.

READV KERNEL SERVICE FAILED. RETURN CODE = *return_code*, REASON CODE = *reason_code*.
Indicates that a kernel READV service failed.

WRITEV KERNEL SERVICE FAILED. RETURN CODE = *return_code*, REASON CODE = *reason_code*.
Indicates that a kernel WRITEV service failed.

SOCKOPT KERNEL SERVICE FAILED. RETURN CODE = *return_code*, REASON CODE = *reason_code*.
Indicates that a kernel SOCKOPT service failed.

Source: OS/390 UNIX System Services kernel (BPX)

© Copyright IBM Corp. 1988, 1999

Detecting Module: BPXBOTBD

System Action: OCS stops running.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the problem indicated by the return code and then have the system administrator reissue the ocsconfig command to start OCS. If the cause of the failure cannot be determined, contact the IBM Support Center.

BPXB004E OCS HAS LOST ITS CONNECTION TO THE FOLLOWING NODE(S): *ocsnodename* **[,** *ocsnodename* **[,** *ocsnodename* **[,** *ocsnodename* **]]]**

Explanation: The socket connection from the Outboard Communication Server (OCS) host to an OCS node has been broken. Up to four of the nodes that have lost the host connection are listed.

In the message text:

ocsnodename
The OCS node name (up to the first 64 characters).

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXBOTBI BPXBOTBO

System Action: OCS waits for the connection to be reestablished.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that the OCS node is up and running and that the OCS host name on the OCS node system is configured as “available”. If the OCS node is to be unavailable for a period of time, have the system administrator unconfigure the OCS node. If more than one node is listed, verify that TCP/IP is up and running.

BPXC001I THE COMPONENT TRACE PARMLIB OPTION *xxxxxxxx* **IS NOT VALID.**

Explanation: The system encountered an incorrect option in the component trace parmlib member CTxBPXyy. Verification continues with the examination of the next option specified.

In the message text:

xxxxxxxx
The specified option that is incorrect.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXCTSSM

System Action: The system does not start the requested component trace. The default option from CTIBPX00 will be used.

Operator Response: Contact the system programmer.

System Programmer Response: Examine the options specifications near the indicated character string for a misspelling or other error. Correct the error in the parmlib member before reissuing the command.

BPXF001I A FILE SYSTEM WITH FILESYSTYPE *type* **FAILED TO INITIALIZE.**
THE SOFTWARE LEVEL IS INCORRECT.

Explanation: During OS/390 UNIX initialization, one of the physical file systems could not be initialized.

In the message text:

type
The value specified with the TYPE parameter of the FILESYSTYPE statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLM

System Action: How the file system **type** is handled depends on the restart option chosen by the file system.

If the option is to be prompted for restart (which is the default option), the error that caused the problem can be corrected, and then the prompt responded to.
If the option is to not start this file system type, the system will continue to run without that file system type.

Operator Response: Contact the system programmer.

System Programmer Response: If any of the following are displayed as the FILESYSTYPE, report this to your IBM Support Center: BPXFCSIN, BPXFPINT, BPXFTCLN, BPXFTSYN.

Try to determine the cause of the failure. Check the level of the software and verify that it is compatible with the level of OS/390 UNIX.

BPXF002I FILE SYSTEM *name* **WAS NOT MOUNTED. RETURN CODE =** *return_code***, REASON CODE =** *reason_code*

Explanation: The system could not mount the specified file system.

In the message text:

name
The file system name specified on a MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

return_code
The return code from the mount request.

reason_code
The reason code from the mount request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT, BPXFTCLN, BPXTXRMT

System Action: The file system is not mounted. The system continues to process other MOUNT statements.

Operator Response: Contact the system programmer.

System Programmer Response: Do one of the following:

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start OS/390 UNIX with the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command. If the statement in error was the ROOT statement, specify '/' as the mountpoint.

Consult the documentation for the file system type specified with the TYPE parameter on the MOUNT statement in the BPXPRMxx member specified to OS/390 UNIX. Make changes as appropriate.

BPXF003I THE FILE SYSTEM DID NOT INITIALIZE. IT FAILED TO ESTABLISH AN ESTAE.
RETURN CODE = *return_code*

Explanation: During OS/390 UNIX initialization, the file system could not be initialized.

In the message text:

return_code
The return code. For an explanation of the return code, see the description of the ESTAEX macro in *OS/390 MVS Programming: Authorized Assembler Services Reference ENF-IXG*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: OS/390 UNIX terminates abnormally.

Operator Response: Contact the system programmer.

System Programmer Response: Contact the IBM Support Center.

BPXF004I THE FILE SYSTEM DID NOT INITIALIZE. NO ROOT STATEMENT WAS FOUND IN PARMLIB MEMBER *member-name***.**

Explanation: During OS/390 UNIX initialization, the file system could not be initialized.

In the message text:

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: OS/390 UNIX terminates abnormally.

Operator Response: Contact the system programmer.

System Programmer Response: Edit the member and verify that the ROOT statement is correctly specified. Then ask the operator to start OS/390 UNIX again.

BPXF005I THE ROOT STATEMENT IN PARMLIB MEMBER *member-name* **DID NOT SPECIFY A TYPE THAT MATCHES ANY FILESYSTYPE STATEMENT.**

Explanation: During OS/390 UNIX initialization, the file system could not be initialized.

In the message text:

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: OS/390 UNIX terminates abnormally.

Operator Response: Contact the system programmer.

System Programmer Response: Edit the member specified and verify that the TYPE parameter on the ROOT statement specifies a value that is specified on a FILESYSTYPE statement also in the member. Make changes as appropriate. IPL the system to start OS/390 UNIX with the revised member.

BPXF006I A FILE SYSTEM WITH FILESYSTYPE *type* **FAILED TO INITIALIZE.**
IT TERMINATED DURING INITIALIZATION.

Explanation: During OS/390 UNIX initialization, one of the physical file systems could not be initialized.

In the message text:

type
The value specified with the TYPE parameter of the FILESYSTYPE statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLM

System Action: How the file system **type** is handled depends on the restart option chosen by the file system.
If the option is to be prompted for restart (which is the default option), the error that caused the problem can be corrected, and then the prompt responded to.
If the option is to not start this file system type, the system will continue to run without that file system type.

Operator Response: Contact the system programmer.

System Programmer Response: If any of the following are displayed as the FILESYSTYPE, report this to your IBM Support Center: BPXFCSIN, BPXFPINT, BPXFTCLN, BPXFTSYN.

Check for error indications that may have been issued by the file system to explain the error.

BPXF007I FILE SYSTEM *name* **WAS NOT MOUNTED. FILE SYSTEM TYPE** *type***, SPECIFIED IN** *member-name***, IS NOT ACTIVE.**

Explanation: During OS/390 UNIX initialization, the system could not mount the specified file system. The file system type named on the MOUNT statement was not initialized.

In the message text:

name
The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

type
The value specified on the FILESYSTYPE statement in the specified parmlib member.

member-name
The member name containing the MOUNT statement.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: The file system is not mounted. The system continues to process other MOUNT statements.

Operator Response: Contact the system programmer.

System Programmer Response: Verify that the FILESYSTYPE statement in the BPXPRMxx parmlib member defines the file system specified with the TYPE parameter on the MOUNT statement.

Do one of the following:

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start OS/390 UNIX with the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

BPXF008I FILE SYSTEM *name* **WAS NOT MOUNTED. THE MOUNT POINT SPECIFIED IN** *member-name* **DOES NOT EXIST.**

Explanation: During OS/390 UNIX initialization, the system could not mount the specified file system. The mount point specified for the file system on the MOUNT statement is not defined.

In the message text:

name
The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file

system, FILESYSTEM refers to the name of the HFS data set containing the file system.

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: The file system is not mounted. The system continues to process other MOUNT statements.

Operator Response: Contact the system programmer.

System Programmer Response: Verify the existence of the mount point specified with the MOUNTPOINT parameter on the MOUNT statement.

Do one of the following:

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start OS/390 UNIX the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

BPXF009I FILE SYSTEM *name* **WAS NOT MOUNTED. THE MOUNT POINT SPECIFIED IN** *member-name* **IS NOT A DIRECTORY.**

Explanation: During OS/390 UNIX initialization, the system could not mount the specified file system because the mount point specified for the file system on the MOUNT statement is not a directory. A file system can be mounted only on a directory.

In the message text:

name
The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: The file system is not mounted. The system continues to process other MOUNT statements.

Operator Response: Contact the system programmer.

System Programmer Response:

Verify that the mount point specified with the MOUNTPOINT parameter on the MOUNT statement in the specified member of SYS1.PARMLIB is a directory.

Do one of the following:

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start OS/390 UNIX with the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

BPXF010I FILE SYSTEM *name* **WAS NOT MOUNTED. THE MOUNT POINT SPECIFIED IN** *member-name* **ALREADY HAS A FILE SYSTEM MOUNTED ON IT.**

Explanation: During OS/390 UNIX initialization, the system could not mount the specified file system.

The mount point specified for the file system on the MOUNT statement in SYS1.PARMLIB is the root for another mounted file system. A file system cannot be mounted on a root.

In the message text:

name
The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: The file system is not mounted. The system continues to process other MOUNT statements.

Operator Response: Contact the system programmer.

System Programmer Response:

Verify that two mount statements don't specify the same MOUNTPOINT.

Do one of the following:

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start OS/390 UNIX with the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

BPXF011I A FILE SYSTEM WITH FILESYSTYPE OR SUBFILESYSTYPE *type* **FAILED TO INITIALIZE. A DUPLICATE FILESYSTYPE/SUBFILESYSTYPE STATEMENT WAS FOUND IN PARMLIB MEMBER** *member-name***.**

Explanation: During OS/390 UNIX initialization, a duplicate physical file system could not be initialized.

In the message text:

type
The value specified with the TYPE parameter of the FILESYSTYPE statement, or the NAME parameter of the SUBFILESYSTYPE statement in the BPXPRMxx parmlib member named.

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT, BPXTCINT

System Action: The duplicate file system type was not started. The system will continue to run without that file system.

Operator Response: Contact the system programmer.

System Programmer Response: Edit the specified member of SYS1.PARMLIB and rename or delete the duplicate FILESYSTYPE/SUBFILESYSTYPE statement. Be sure to change all mounts for the renamed file system to specify the new type. In order

to start that file system, IPL the system to start OS/390 UNIX with the revised member.

BPXF012I NEITHER FILESYSTEM NOR DDNAME WAS SPECIFIED ON EITHER A MOUNT OR A ROOT STATEMENT IN PARMLIB MEMBER *member-name***.**

Explanation: During OS/390 UNIX initialization, an error was detected while processing the file system statements in the BPXPRMxx parmlib member named.

In the message text:

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: The statement is ignored. The system continues to process other SYS1.PARMLIB statements.

Operator Response: Contact the system programmer.

System Programmer Response: Edit the specified member of SYS1.PARMLIB and correct the problem. Either FILESYSTEM or DDNAME must be specified on each ROOT and MOUNT statement. Ipl the system to start OS/390 UNIX with the revised member.

BPXF013I FILE SYSTEM *name* **WAS SUCCESSFULLY MOUNTED.**

Explanation: During OS/390 UNIX initialization, a file system was successfully mounted.

In the message text:

name
The file system name specified on either the ROOT statement or a MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT, BPXFTCLN

System Action: The file system was mounted. The system continues to process other SYS1.PARMLIB statements.

Operator Response: None.

System Programmer Response: None.

BPXF014D FILESYSTYPE *type* **TERMINATED. REPLY 'R' WHEN READY TO RESTART.**

Explanation: The named file system type has ended processing.

In the message text:

type
The file system type from the FILESYSTYPE statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLM

System Action: The system continues processing without the named file system type. Processing for other file systems continues, but the system does not try to restart the named file system type until the operator responds to this message.

Operator Response: Gather any error indications, such as diagnostic messages or dump messages, that precede this message. If possible, correct the problem and reply **R** to restart the file system type. If you cannot resolve the problem, notify the system programmer.

System Programmer Response: If the operator action did not restart the file system type, use the error indication information to diagnose the problem; then, reply **R** to restart the file system type. If you cannot, search the problem reporting data base for a fix. If no fix exists, contact IBM Support for the product that failed.

BPXF015I THE REPLY IS NOT VALID

Explanation: The operator replied incorrectly to a prompt.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLM

System Action: The prompt is repeated.

Operator Response: Reply correctly to allow the restart to continue.

System Programmer Response: None.

BPXF016I *procname* **TERMINATING. THE ROOT FILE SYSTEM, FILESYSTYPE** *type***, TERMINATED.**

Explanation: The physical file system identified by the FILESYSTYPE specified failed. Because this physical file system is the file system specified on the ROOT statement, OS/390 UNIX must terminate.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

type
The value specified with the TYPE parameter of the FILESYSTYPE statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLM

System Action: OS/390 UNIX will terminate. The root is required for OS/390 UNIX to run.

Operator Response: Contact the system programmer.

System Programmer Response: Check for error indications that may have been issued by the system to explain the error.

BPXF017I *procname* **TERMINATING. FILE SYSTEM, FILESYSTYPE** *type***, TERMINATED.**

Explanation: The physical file system identified by the FILESYSTYPE specified failed. Because this is a required physical file system, OS/390 UNIX is also terminated.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

type
The value specified with the TYPE parameter of the FILESYSTYPE statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLM

System Action: OS/390 UNIX will terminate abnormally.

Operator Response: Contact the system programmer.

System Programmer Response: If any of the following are displayed as the FILESYSTYPE, report this to your IBM Support Center: BPXFCSIN, BPXFPINT, BPXFTCLN, BPXFTSYN.

Check for error indications that may have been issued by the file system to explain the error.

BPXF018I DEVICE DRIVER INITIALIZATION ROUTINE *modname* FAILED. RETURN CODE = *return_code*

Explanation: During character special file system initialization, a device driver could not be initialized.

In the message text:

modname
The name of the module invoked during device driver initialization.

return_code
The return code returned in register 15.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFCSIN

System Action: The character special file system bypasses the failing device driver and continues to initialize any remaining device drivers.

Operator Response: Contact the system programmer.

System Programmer Response: Check for error indications that may have been issued by the character special file system to explain the error.

BPXF019I AN ABEND OCCURRED WHILE PROCESSING DEVICE DRIVER INITIALIZATION ROUTINE *modname*.

Explanation: During character special file system initialization, an abend occurred during processing of a device driver initialization routine.

In the message text:

modname
The name of the module invoked during device driver initialization.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFCSIN

System Action: The character special file system bypasses the failing device driver and continues to initialize any remaining device drivers.

Operator Response: Contact the system programmer.

System Programmer Response: Check for error indications that may have been issued by the character special file system to explain the error.

BPXF020I FILE SYSTEM *name* MAY BE DAMAGED. RETURN CODE = *return_code*, REASON CODE = *reason_code*

Explanation: A severe error occurred while the named file system was processing a request. It may have damaged the file system. Unless it was suppressed, there should also be an SDUMP created by the file system. In this case, service should be contacted to handle the problem.

In the message text:

name
The file system name specified either on a MOUNT statement in the BPXPRMxx parmlib member or on a MOUNT command.

return_code
The return code from the file system request.

reason_code
The reason code from the file system request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFVNL

System Action: None. Processing continues, possibly causing further damage to the file system. However, if you can access the same files that you were accessing when this occurred without further problems, there is probably not any damage to the file system.

Operator Response: Contact the system programmer.

System Programmer Response: Determine the cause of the error. If necessary, contact the IBM support center for the physical file system that owns the damaged file system.

System Programmer Response: Determine the cause of the error. If necessary, contact the IBM support center for the physical file system that owns the damaged file system.

BPXF021I NOT ALL FILE SYSTEMS COULD BE SHUTDOWN WHEN *procname* TERMINATED.

Explanation: During termination, OS/390 UNIX detected a potential error condition. The system issued this message and then generated an abend EC6 with a reason code of X'8728'. The system did not create a dump for this abend.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: OS/390 UNIX termination completes.

Operator Response: Contact the system programmer.

System Programmer Response: Contact the IBM Support Center.

BPXF022I A FILE SYSTEM WITH FILESYSTYPE *type* FAILED TO INITIALIZE.
THE FILE SYSTEM MUST RUN IN THE OMVS ADDRESS SPACE.

Explanation: During file system initialization, a FILESYSTYPE statement was encountered with the ASNAME parameter specified. This file system can run only in the Kernel address space.

In the message text:

type
The value specified with the TYPE parameter of the FILESYSTYPE statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTUINT, BPXTIINT, BPXTAMD, BPXTCINT

System Action: OS/390 UNIX initialization continues without this file system.

Operator Response: Contact the system programmer.

System Programmer Response: Verify that the ASNAME parameter on the FILESYSTYPE statement in the BPXPRMxx parmlib member is not specified for this physical file system.

BPXF023I FILE SYSTEM *name* SPECIFIED ON EITHER A MOUNT OR A ROOT STATEMENT IN PARMLIB MEMBER *member-name* MAY NOT BE MOUNTED ASYNCHRONOUSLY.

Explanation: During OS/390 UNIX initialization, the specified file system could not be mounted because the physical file system indicated that the mount would complete asynchronously.

In the message text:

name
The file system name specified on either the ROOT statement or a MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: If the file system was specified on a ROOT statement, OS/390 UNIX will instead mount an empty root file system, causing all subsequent mounts to fail. If the file system was specified on a MOUNT statement, the file system is not mounted, and the system continues to process other MOUNT statements.

Operator Response: Contact the system programmer.

System Programmer Response: Direct the mount to a file system which completes mounts synchronously, mount the file system later using the TSO/E MOUNT command or mount callable service, or direct the file system to complete the mount synchronously at initialization.

BPXF024I *text*

Explanation: The contents of the user's write buffer at the time of the write request is displayed.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXVDCNS

System Action: None.

Operator Response: None, depending on the contents of the text. If the text contains a message id, refer to the proper documentation for that message to further determine the cause of the message.

System Programmer Response: None.

BPXF025I FILE SYSTEM *name* IS BEING MOUNTED.

Explanation: During OS/390 UNIX initialization, the physical file system began mount processing for a file system. The file system will not be available until the physical file system completes mount processing for it.

In the message text:

name
The file system name specified on a MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: The file system is not available. The system continues to process other SYS1.PARMLIB statements.

Operator Response: None.

System Programmer Response: None.

BPXF028I FILE SYSTEM *name* WAS NOT MOUNTED. RETURN CODE = *return_code*, REASON CODE = *reason_code*

Explanation: The system could not complete mounting the specified file system.

In the message text:

name
The file system name specified on a MOUNT request. For the HFS file system, it refers to the name of the HFS data set containing the file system.

return_code
The return code from the mount request.

reason_code
The reason code from the mount request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFTCLN

System Action: The partially mounted file system is unmounted.

Operator Response: Contact the system programmer.

System Programmer Response: Consult the documentation for the file system type specified with the TYPE parameter on the MOUNT request. Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

BPXF029E ROOT FILE SYSTEM *name* WAS NOT MOUNTED. RETURN CODE = *return_code*, REASON CODE = *reason_code*

Explanation: The system could not mount the specified file system.

In the message text:

name
The file system name specified on a ROOT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

return_code
The return code from the mount request.

reason_code
The reason code from the mount request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLIT

System Action: The file system is not mounted. The system is activated without a ROOT.

Operator Response: Contact the system programmer.

System Programmer Response: Do one of the following:

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start OS/390 UNIX with the revised member.

- Ask a superuser to enter the corrected information using the TSO/E MOUNT command. In this case specify '/' as the mountpoint.

Consult the documentation for the file system type specified with the TYPE parameter on the ROOT statement in the BPXPRMxx member specified to OS/390 UNIX. Make changes as appropriate.

BPXF030I MAXSOCKETS HAS BEEN REACHED FOR DOMAIN *domain-name***. REQUESTS FOR SOCKETS MAY BE DENIED.**

Explanation: While processing either a socket() or an accept() request the value specified for MAXSOCKETS was reached. Any requests for new sockets will be denied until some of the currently allocated sockets are closed.

In the message text:

domain-name
The domain name specified on the NETWORK statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTSSMI, BPXTSSMU

System Action: This is just an informational message so that the operator will be aware that users may be being rejected. This message will only be issued once per IPL when the condition is first detected.

Operator Response: Contact the system programmer.

System Programmer Response: Consider raising the MAXSOCKETS value specified in the BPXPRMxx parmlib member that was used to start OS/390 UNIX. This new value will take effect with the next system IPL.

BPXF031I A FILE SYSTEM WITH SUBFILESYSTYPE *type* **WAS INCORRECTLY SPECIFIED AS THE DEFAULT TRANSPORT DRIVER IN PARMLIB MEMBER** *member-name*

Explanation: During OS/390 UNIX initialization, the DEFAULT parameter was found on a file system that cannot be specified as the default transport driver.

In the message text:

type
The value specified with the NAME parameter of the SUBFILESYSTYPE statement in the BPXPRMxx parmlib member named.

member-name
The member name processed as a result of the START request.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCINT

System Action: The DEFAULT specification is ignored. Initialization continues as if no default was specified.

Operator Response: Contact the system programmer.

System Programmer Response: If a default other than the generic default is desired, edit the member in SYS1.PARMLIB and move the DEFAULT parameter to the SUBFILESYSTYPE statement that is intended to be the default. In order to have the changes take effect, a re-IPL of the system is needed.

BPXF032D FILESYSTYPE *type* **TERMINATED. REPLY 'R' WHEN READY TO RESTART. REPLY 'I' TO IGNORE.**

Explanation: The named file system type has ended processing.

In the message text:

type
The file system type from the FILESYSTYPE statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFSLM

System Action: The system continues processing without the named file system type. Processing for other file systems continues, but the system does not try to restart the named file system type until the operator responds to this message.

Operator Response: Gather any error indications, such as diagnostic messages or dump messages, that precede this message. If possible, correct the problem and reply R to restart the file system type. If you cannot resolve the problem, contact the system programmer. If processing can continue without this file system type reply I to remove the prompt and leave this file system terminated.

System Programmer Response: If operator action did not restart the file system type, use the error indication information to diagnose the problem, then reply R to restart the file system type. If you cannot, search the problem reporting data base for a fix. If no fix exists, contact IBM support for the product that failed. If the reply to this message was I, and you later want to restart that file system type, use SETOMVS RESET=xx.

BPXF033I A FILESYSTEM WITH THE FILESYSTYPE OR SUBFILESYSTYPE NAME *type* **FAILED TO INITIALIZE. THE MAXIMUM FILESYSTYPE OR SUBFILESYSTYPE STATEMENTS HAVE ALREADY BEEN PROCESSED. THE PARMLIB MEMBER PROCESSED AT THE TIME WAS** *member-name***.**

Explanation: During OS/390 UNIX initialization or reset, a physical file system could not be initialized. The maximum number of subfilesystems have already been specified. The maximum number is 32.

In the message text:

type
The value specified with the TYPE parameter of the FILESYSTYPE statement, or the NAME parameter of the SUBFILESYSTYPE statement in the BPXPRMxx parmlib member named.

member-name
The member name being processed when the limit was reached.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCINT

System Action: The subfilesystem type was not started. The system will continue to run without that subfilesystem.

Operator Response: Contact the system programmer.

System Programmer Response: Edit the specified member of SYS1.PARMLIB and delete unnecessary SUBFILESYSTYPE statements.

BPXF101E RETURN CODE *return_code* RECEIVED DURING PARSING OF THE COMMAND.

Explanation: An error occurred during the parse of the command.

In the message text:

return_code
The value of the return code received from IKJPARS. For an explanation of the return code, see the appropriate section for the failing service in *OS/390 TSO/E Programming Services*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Refer to the actions suggested by the parser for the return code received. Correct the syntax of the command and reenter it.

System Programmer Response: None.

BPXF102E MVS PDS OR PDSE WITH DDNAME *ddname* WAS SPECIFIED FOR EITHER INPUT OR OUTPUT. A MEMBER NAME IS REQUIRED.

Explanation: When either a PDS or a PDSE is specified, a member name must also be entered.

In the message text:

ddname
The data definition name of the PDS or PDSE that was specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command, after specifying a ddname for a PDS or PDSE with a member name.

System Programmer Response: None.

BPXF103E RETURN CODE *return_code* WAS RECEIVED DURING AN ATTEMPT TO OBTAIN STORAGE FOR A BUFFER.

Explanation: During processing of the command, a request was made for storage. The request failed for the reason identified by the return code.

In the message text:

return_code
The return code received when storage was requested. For an explanation of the return code, see the description of the Storage macro in *OS/390 MVS Programming: Assembler Services Reference* .

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUO2O

System Action: Processing for the command ends.

Operator Response: None.

User Response: If the problem persists, increase your region size.

System Programmer Response: If the problem persists, increase the user's region size.

BPXF104E AN ERROR OCCURRED DURING THE OPENING OF AN MVS DATA SET WITH DDNAME *ddname*.

Explanation: The MVS data set is not opened. This may happen when:

- The member name specified for input doesn't exist.
- The DCB attributes (for example, lrecl, recfm, blksize) are incorrect and thus the data set cannot be opened.
- The data set is neither a sequential data set nor a member of a partitioned sequential data set (that is, a PDS or PDSE).

In the message text:

ddname
The data definition name specified for either the INDD or OUTDD operand.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Determine the cause and correct the error. If the error was caused by the attributes being incorrect, reallocate the data set with the correct attributes. Then reenter the command.

System Programmer Response: None.

BPXF105E RETURN CODE *return_code*, REASON CODE *reason_code*.
AN ERROR OCCURRED DURING THE OPENING OF HFS FILE *pathname*.

Explanation: The system was unable to open the HFS file because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from the open request.

reason_code
The reason code received from the open request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

pathname
The pathname of the HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUO2O

System Action: Processing for the command ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem with the open request. Correct the error, and then reenter the command.

System Programmer Response: None.

BPXF106E RETURN CODE *return_code*, **REASON CODE** *reason_code*.
AN ERROR OCCURRED DURING THE WRITING TO HFS FILE *pathname*.

Explanation: The system was unable to write to the HFS file because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from the write request.

reason_code
The reason code returned from the write request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

pathname
The pathname of the HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUO2O

System Action: Processing for the command ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem with the write request. Correct the error, and then reenter the command.

System Programmer Response: None.

BPXF107E THE RECORD FORMAT OF THE INPUT DATA SET WITH DDNAME *ddname* **IS NOT VALID.**

Explanation: The only record formats that are valid are F (fixed), V (variable), and U (undefined).

This condition can occur when a U format data set is specified as the receiver of a copy of a text HFS file. This is not supported.

In the message text:

ddname
The data definition name specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Check the record format of the data set, and correct it before entering the command again.

System Programmer Response: None.

BPXF108E THE RECORD FORMAT OF THE OUTPUT DATA SET WITH DDNAME *ddname* **IS NOT VALID.**

Explanation: The only record formats that are valid are F (fixed), V (variable), and U (undefined). Sometimes the user may not specify the record format in the data set. For example, when the user allocates the terminal as output, he must specify the record format as something instead of just empty.

The other time that this condition can occur when a U format data set is specified as the receiver of a copy of a text HFS file. This is not supported.

In the message text:

ddname
The data definition name specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Check the record format of the data set, and correct it before entering the command again.

System Programmer Response: None.

BPXF110E RETURN CODE *return_code*, **REASON CODE** *reason_code*.
AN ERROR OCCURRED WHILE READING FROM HFS FILE *pathname*.

Explanation: The system was unable to read from the HFS file because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code returned from the read request.

reason_code
The reason code returned from the read request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*

pathname
The name of the HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUO2O

System Action: Processing for the command ends.

Operator Response: None.

User Response: Correct the problem as identified by the return code and reason code. Then reenter the command.

System Programmer Response: None.

BPXF111E COPY FAILED. RETURN CODE *return_code* **WAS RECEIVED DURING THE COPY.**

Explanation: The copy operation failed for the reason described by the return code.

In the message text:

return_code
The return code received during the copying operation. For an explanation of the return code, see *OS/390 MVS System Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Correct the problem and reenter the command.

System Programmer Response: None.

BPXF112W THE RECORD SIZE IN THE OUTPUT DATA SET IS SMALLER THAN A LINE IN THE INPUT FILE. SOME RECORDS HAVE BEEN TRUNCATED.

Explanation: The record size of the output data set is smaller than the size of a line in the input HFS file. This caused records to be truncated. A line is delimited by a '\n' new line character in the input file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing of the command continues, truncating records when required.

Operator Response: None.

User Response: Should the result of the copy be unsatisfactory, create an output data set with a larger record size and reenter the command.

System Programmer Response: None.

BPXF113W THE LOAD MODULE COPIED IS NOT A PROGRAM OBJECT AND MAY NOT BE EXECUTABLE.

Explanation: In order for a load module to execute it must be a program object.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing of the command continues, but the output may not be usable.

Operator Response: None.

User Response: None. This is just a warning message to make sure that the user is aware that the load module may not be executable.

System Programmer Response: None.

BPXF114E REASON CODE *reason_code* **RECEIVED WHILE ATTEMPTING TO LOAD CONVERSION TABLE** *tabname***.**

Explanation: An error occurred during the load of the conversion table.

In the message text:

reason_code
The value of the reason code received from the load request. For an explanation of the return code, see the description of the Load macro in *OS/390 MVS Programming: Assembler Services Reference*.

tabname
The name of the conversion table to be loaded.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Check the name of the conversion table and make sure that the conversion table exists in the system.

System Programmer Response: Find and correct the problem that caused the error; then inform the user that he or she can reenter the command.

BPXF115E AN ERROR OCCURRED DURING THE OPENING OF LIBRARY DATA SET *name* **FOR THE CONVERT FUNCTION.**

Explanation: The MVS data set is not opened. This may happen when:

- The member name specified for input doesn't exist.
- The DCB attributes (for example, lrecl, recfm, blksize) are incorrect and thus the data set cannot be opened.
- The data set is a VSAM data set.

In the message text:

name
The name of the library data set.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Specify an acceptable data set containing the conversion table. Usually, this is a PDS(E) with a format of U.

System Programmer Response: Find and correct the problem that caused the error; then inform the user so that he or she can reenter the command.

BPXF116E RETURN CODE *return_code* **RECEIVED DURING THE SET UP OF THE RECOVERY ENVIRONMENT.**

Explanation: An error occurred during the set up of the recovery environment.

In the message text:

return_code
The value of the return code received while setting up the recovery environment. For an explanation of the return code, see the description of the ESTAEX macro in *OS/390 MVS Programming: Assembler Services Reference*

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Refer to the actions suggested for the return code received.

System Programmer Response: None.

BPXF117E THE LENGTH OF THE CONVERSION TABLE IS TOO SHORT.

Explanation: The length specified for the length of the conversion table is not large enough. The minimum length of the conversion table is 512 bytes.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Verify that the proper conversion table was specified. If the problem persists, refer this problem to the system programmer.

System Programmer Response: Find and correct the problem that caused the error; then inform the user so that he or she can reenter the command.

BPXF118W NO DATA CONVERSION IS PERFORMED. EITHER THE TO1047 OR THE FROM1047 KEYWORD IS REQUIRED FOR THIS CONVERT OPERATION.

Explanation: The command does not process unless either the TO1037 or the FROM1047 keyword is specified.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: The copy continues, but no data conversion was done.

Operator Response: None.

User Response: If conversion is desired, reenter the command with the proper keyword.

System Programmer Response: None.

BPXF119W THE RECORD SIZE IN THE OUTPUT DATA SET IS SMALLER THAN THAT OF THE INPUT DATA SET. SOME RECORDS HAVE BEEN TRUNCATED.

Explanation: The record size of the output data set is smaller than that of the input data set. This caused records to be truncated.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing of the command continues, truncating records.

Operator Response: None.

User Response: If the result of the copy is unsatisfactory, create an output data set with a larger record size and reenter the command.

System Programmer Response: None.

BPXF120E AN ERROR OCCURRED DURING THE OPENING OF MVS DATA SET *dsname*.

Explanation: The MVS data set is not opened. For some possible reasons for this, see message BPXF104E.

In the message text:

dsname
The data set name specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUPTC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Determine the cause and correct the error. If the error was caused by the attributes being incorrect, reallocate the data set with the correct attributes. Then reenter the command.

System Programmer Response: None.

BPXF121E THE RECORD FORMAT OF DATA SET *dsname* IS INCORRECT.

Explanation: For an explanation of some of the reasons for this, see message BPXF107E.

In the message text:

dsname
The data definition name specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUPTC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Check the record format of the data set, and correct it before entering the command again.

System Programmer Response: None.

BPXF123E AN HFS FILE CANNOT BE COPIED TO ITSELF.

Explanation: The same HFS file was specified via INDD and OUTDD. Since the copy operation would destroy the file, the command was rejected.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Specify a different HFS file for either INDD or OUTDD when reentering the command.

System Programmer Response: None.

BPXF124E THE DATA SET NAME IS MISSING.

Explanation: A data set name must be specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUGTC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command, this time specifying a data set name.

System Programmer Response: None.

BPXF125E EITHER THE PATHNAME IS MISSING, OR QUOTES ARE MISSING AROUND IT.

Explanation: A pathname must be specified on the command, and it must be specified in quotes.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUGTC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command, this time specifying a proper pathname.

System Programmer Response: None.

**BPXF126E MVS PDS OR PDSE *name* WAS SPECIFIED AS THE INPUT DATA SET.
A MEMBER NAME IS REQUIRED.**

Explanation: When either a PDS or a PDSE is specified, a member name must also be entered.

In the message text:

name
The name of a PDS or PDSE that was specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUPTC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command, this time specifying a member name.

System Programmer Response: None.

BPXF127E AN ERROR OCCURRED DURING THE OPENING OF MEMBER *memname* IN MVS DATA SET *dsname*.

Explanation: The MVS data set is not opened. Any of the following could be the reason for this:

- The member does not exist in the input PDS.
- The input data set is a sequential data set but the specified member name or the DCB information (for example, record size or buffer size) is incorrect.
- The data set is not a PDS(E). This could mean that it is a VSAM data set.

In the message text:

memname
The member name.

dsname
The data set name specified.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUEST

System Action: Processing for the command ends.

Operator Response: None.

User Response: Determine the cause of the problem, correct it, and reenter the command.

System Programmer Response: None.

BPXF128E AN ERROR OCCURRED DURING THE OPENING OF AN MVS DATA SET.

Explanation: The MVS data set is not opened. Some of the reasons for this are:

- The DCB information is incorrect.
- The data set is not a sequential data set.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUEST

System Action: Processing for the command ends.

Operator Response: None.

User Response: Determine the cause of the problem, correct it, and reenter the command.

System Programmer Response: None.

BPXF129E MVS PDS OR PDSE *name* WAS SPECIFIED AS THE OUTPUT FILE. A MEMBER NAME IS REQUIRED.

Explanation: When either a PDS or a PDSE is specified, a member name must also be entered.

In the message text:

name
The name of a PDS or PDSE that was specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUGTC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command, this time specifying a member name.

System Programmer Response: None.

BPXF130E A PARTITIONED DATA SET MUST EXIST PRIOR TO COPYING. A NEW PARTITIONED DATA SET IS NOT DYNAMICALLY ALLOCATED.

Explanation: The OGET command does not create an output PDS(E). It must be preallocated.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUGTC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command after allocating a PDS(E).

System Programmer Response: None.

BPXF131E AN HFS DATA SET IS NOT SUPPORTED FOR EITHER THE SOURCE OR THE TARGET.

Explanation: Either the source or the target specified an HFS data set instead of a PDS(E).

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command, specifying an acceptable data set.

System Programmer Response: None.

BPXF132E THERE IS A RECORD FORMAT ERROR FOR MVS DATA SET *name*. EITHER THE OUTPUT RECORD FORMAT IS UNDEFINED FOR A TEXT INPUT FILE, OR THE OUTPUT RECORD FORMAT IS NOT VALID.

Explanation: The only record formats that are valid are F (fixed), V (variable), and U (undefined).

This condition can occur when a U format data set is specified as the receiver of a copy of a text HFS file. This is not supported.

In the message text:

name
The name of a PDS or PDSE that was specified on the command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUGTC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command, specifying an acceptable data set.

System Programmer Response: None.

BPXF134E RETURN CODE *return_code*, REASON CODE *reason_code*.
AN ERROR OCCURRED DURING THE CREATION OF DIRECTORY *pathname*.

Explanation: The system was unable to create the directory because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from the create request.

reason_code
The reason code received from the create request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

pathname
The pathname of the directory of HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUMKD

System Action: Processing for the command ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem. Correct the error, and then reenter the command.

System Programmer Response: None.

BPXF135E RETURN CODE *return_code*, REASON CODE *reason_code*.
THE MOUNT FAILED FOR FILE SYSTEM *fsname*.

Explanation: The system was unable to mount the file system because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from a callable service.

reason_code
The reason code received from a callable service. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

fsname
The name of the file system to be mounted.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUMNT

System Action: Processing for the command ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem. Correct the error, and then reenter the command.

System Programmer Response: None.

BPXF136E A MEMBER NAME MUST NOT BE SPECIFIED FOR A FILE SYSTEM.

Explanation: When an HFS data set is specified on mount, it must not include a member name.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUMNT

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command without specifying a member name.

System Programmer Response: None.

BPXF137E RETURN CODE *return_code*, REASON CODE *reason_code*.
THE UNMOUNT FAILED FOR FILE SYSTEM *fsname*.

Explanation: The system was unable to unmount the file system because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from the unmount request.

reason_code
The reason code received from the unmount request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

fsname
The name of the file system to be unmounted.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUUMT

System Action: Processing for the command ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem. Correct the error, and then reenter the command.

System Programmer Response: None.

BPXF138E RETURN CODE *return_code*, REASON CODE *reason_code*.
AN ERROR OCCURRED CREATING FILE *pathname*.

Explanation: The system was unable to create the file because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from the mknod request.

reason_code
The reason code received from the mknod request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

pathname
The name of the file to be created.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUMKN

System Action: Processing for the command ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem. Correct the error, and then reenter the command.

System Programmer Response: None.

BPXF139E COPYING OF A LOAD MODULE BETWEEN A PDS AND A PDSE IS NOT SUPPORTED.

Explanation: Copying a load module between a PDS and a PDSE must invoke the binder to convert the load module from nonlinear format to a program object or vice verse. OCOPY will not invoke the binder.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: If the intent was to copy a load module, use IEBCOPY or the binder to perform the copy. Otherwise, specify the correct data set name and reenter the command.

System Programmer Response: None.

BPXF140E RETURN CODE *return_code*, REASON CODE *reason_code*. A LINK FAILED FOR LINK NAME *linkname*.

Explanation: The BPXCOPY utility was unable to create a link (that is, alias) for the specified name.

In the message text:

return_code
The return code received from the link request.

reason_code
The reason code received from the link request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

linkname
The link name of the HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem with the link request. Correct the error, and then reenter the request.

System Programmer Response: None.

BPXF141E COPYING FROM A DATA SET TO ANOTHER DATA SET IS NOT SUPPORTED.

Explanation: The BPXCOPY utility does not support copying from one data set to another data set.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Correct the error and reenter the request.

System Programmer Response: None.

BPXF142E COPYING FROM AN HFS FILE TO ANOTHER HFS FILE IS NOT SUPPORTED.

Explanation: The BPXCOPY utility does not support copying from one HFS file to another HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Correct the error and reenter the request.

System Programmer Response: None.

BPXF143E COPYING FROM AN HFS FILE TO A DATA SET IS NOT SUPPORTED.

Explanation: The BPXCOPY utility does not support copying from an HFS file to a data set.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Correct the error and reenter the request.

System Programmer Response: None.

BPXF145E AN ELEMENT NAME IS REQUIRED INPUT TO BPXCOPY.

Explanation: An element name is a required keyword for the BPXCOPY utility.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Correct the error and reenter the request.

System Programmer Response: None.

BPXF146E AN INPUT FILE CONTAINING NULL LINES CANNOT BE COPIED TO A VBA OR VBM DATA SET.

Explanation: The input file contains a null line, which does not contain any data. The output data set contains variable length records with ASA or machine control characters. A minimum length of 1 byte of input data is required to create a record in this output data set.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: If an output data set containing variable blocked (VB) records is desired, create it without machine control characters. (Do not specify VBA or VBM.) After correcting the problem, reenter the command, specifying that data set as the target.

System Programmer Response: None.

BPXF147E READ-ONLY IS SPECIFIED IN THE PATHOPTS FOR THE OUTPUT FILE. USE PATHOPTS(OVERRIDE) TO OVERRIDE THE PATHOPTS IF DESIRED.

Explanation: The access group option of the PATHOPTS operand of the ALLOCATE command is inconsistent for the output file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Either reissue the ALLOCATE command specifying an appropriate PATHOPTS keyword and then reenter this command, or reenter this command with the PATHOPTS(OVERRIDE) keyword.

System Programmer Response: None.

BPXF148E WRITE-ONLY IS SPECIFIED IN THE PATHOPTS FOR THE INPUT FILE. USE PATHOPTS(OVERRIDE) TO OVERRIDE THE PATHOPTS IF DESIRED.

Explanation: The access group option of the PATHOPTS operand of the ALLOCATE command is inconsistent for the input file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Either reissue the ALLOCATE command specifying an appropriate PATHOPTS keyword and then reenter this command, or reenter this command with the PATHOPTS(OVERRIDE) keyword.

System Programmer Response: None.

BPXF150I MVS DATA SET WITH DDNAME *ddname* **SUCCESSFULLY COPIED INTO** *type* **HFS FILE** *pathname***.**

Explanation: This is a success message. Processing completed successfully.

In the message text:

ddname
The data definition name specified for input.

type
The type of the file - either BINARY or TEXT.

pathname
The name of the HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing continues.

Operator Response: None.

User Response: None.

System Programmer Response: None.

BPXF151I BPXCOPY WAS INVOKED FOR HEAD ID *headid***.**

Explanation: This is an informational message to identify that this is the start of the message section for an invocation of BPXCOPY.

In the message text:

headid
The heading identifier supplied.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing continues.

Operator Response: None.

User Response: None.

System Programmer Response: None.

BPXF152W THE INPUT FILE SPECIFIED IS A DIRECTORY.

Explanation: The input file specified is a directory file instead of a regular file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing of the command continues; directory data is copied, if any.

Operator Response: None.

User Response: Make sure that you intended to copy a directory.

System Programmer Response: None.

BPXF153W NO DATA HAS BEEN COPIED. THE INPUT FILE CONTAINS ZERO BYTES OF DATA.

Explanation: The input file contains zero bytes of data.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing of the command continues; no data is copied.

Operator Response: None.

User Response: If an incorrect name was specified, reenter the command with the correct file name.

System Programmer Response: None.

BPXF154E DATA SET OF VARIABLE SPANNED RECORD FORMAT IS NOT SUPPORTED.

Explanation: Data set with variable spanned record is not allowed.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPC

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command, specifying an acceptable data set.

System Programmer Response: None.

BPXF155E PATHMODE SPECIFIED HAS INCORRECT VALUES.

Explanation: Pathmode has incorrect values. Must be from 0 to 7 OR Correct number of pathmode values not specified. Must have 4 values.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Reenter the request, specifying an acceptable pathmode.

System Programmer Response: None.

BPXF156E RETURN CODE *return_code***, REASON CODE** *reason_code***. PATHMODE COULD NOT BE SET FOR FILE** *pathname***.**

Explanation: The system was unable to change the mode of the file because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from chmod.

reason_code
The reason code received from chmod. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

pathname
The name of the file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Verify that you have authority to set pathmode and reenter the request.

System Programmer Response: None.

BPXF157E RETURN CODE *return_code* **RECEIVED DURING STACKING OF THE MESSAGE OUTPUT DATA SET WITH DDNAME** *ddname***.**

Explanation: An error occurred during the STACK of the message output ddname.

In the message text:

return_code
The return code received from IKJSTCK. For an explanation of the return code, see the appropriate section for the failing service in *OS/390 TSO/E Programming Services*.

ddname
The data definition name specified for the message output.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for BPXCOPY ends, without copying.

Operator Response: None.

User Response: Verify that the specified message output ddname is allocated. Correct the problem as identified by the return code and reenter the request.

System Programmer Response: None.

BPXF158E RETURN CODE *return_code* **RECEIVED DURING THE STACK DELETE OF THE MESSAGE OUTPUT DATA SET ELEMENT FOR DDNAME** *ddname***.**

Explanation: An error occurred during the STACK DELETE of the message output ddname element.

In the message text:

return_code
The return code received from IKJSTCK. For an explanation of the return code, see the appropriate section for the failing service in *OS/390 TSO/E Programming Services*.

ddname
The data definition name specified for the message output.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for BPXCOPY ends. The copy may or may not have been done. The message output data set may not be closed.

Operator Response: None.

User Response: Correct the problem as identified by the return code from IKJSTCK and reenter the request. If the problem persists, refer this problem to the system programmer.

System Programmer Response: Find and correct the problem that caused the error; then inform the user so that he or she can reenter the command.

BPXF159E *cmdname* **ABENDED. SYSTEM COMPLETION CODE** *syscompcode***.**

Explanation: The command abended for the reason described by the system completion code.

In the message text:

cmdname
The command that was running.

syscompcode
The system completion code. For an explanation of the code, see *OS/390 MVS System Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUEST

System Action: Processing for the command ends.

Operator Response: None.

User Response: Determine the cause of the problem, correct it, and reenter the command.

System Programmer Response: None.

BPXF160E RETURN CODE *return_code***, REASON CODE** *reason_code***, OBTAINING STATUS OF THE MOUNT POINT.**

Explanation: The system was unable to obtain the status of the mount point because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from the stat request.

reason_code
The reason code received from the stat request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUMNT

System Action: Processing for the command ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem. Correct the error, and then reenter the command.

System Programmer Response: None.

BPXF161I ASYNCHRONOUS MOUNT IS IN PROGRESS FOR FILE SYSTEM *fsname*.

Explanation: The file system is being mounted asynchronously.

In the message text:

fsname
The name of the file system to be mounted.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUMNT

System Action: Processing for the command continues.

Operator Response: None.

User Response: None.

System Programmer Response: None.

BPXF162E ASYNCHRONOUS MOUNT FAILED FOR FILE SYSTEM *fsname*.

Explanation: The system was unable to mount the file system because of an asynchronous failure. Because the mount was processed asynchronously, no detailed return information on the failure is available.

In the message text:

fsname
The name of the file system to be mounted.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUMNT

System Action: Processing for the command ends.

Operator Response: None.

User Response: Reenter the command.

System Programmer Response: None.

BPXF163E USER NAME *username* IS NOT DEFINED.

Explanation: UID(username) is not defined in the security data base.

In the message text:

username
The userID.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Reenter the request, specifying a defined username or UID.

System Programmer Response: None.

BPXF164E UID *uid* IS NOT DEFINED.

Explanation: UID(uid) is not defined in the security data base.

In the message text:

uid The UID.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Reenter the request, specifying a defined username or UID.

System Programmer Response: None.

BPXF165E GROUP NAME *groupname* IS NOT DEFINED.

Explanation: GID(groupname) is not defined in the security data base.

In the message text:

groupname
The group name.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Reenter the request, specifying a defined group name or GID.

System Programmer Response: None.

BPXF166E GID *gid* IS NOT DEFINED.

Explanation: GID(gid) is not defined in the security data base.

In the message text:

gid The groupID.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Reenter the request, specifying a defined group name or GID.

System Programmer Response: None.

BPXF167E RETURN CODE *return_code*, REASONCODE *reason_code*, UID and GID COULD NOT BE SET FOR FILE *pathname*.

Explanation: The system was unable to change the owner and/or the group owner of the file because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from chattr.

reason_code
The reason code received from chattr. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

pathname
The name of the file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Correct the condition indicated by the return code and reenter the request.

System Programmer Response: None.

BPXF168E RETURN CODE *return_code***, REASONCODE** *reason_code***, UID and GID COULD NOT BE SET FOR SYMLINK** *pathname***.**

Explanation: The system was unable to change the owner and/or the group owner of the symlink because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
The return code received from lchown.

reason_code
The reason code received from lchown. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

pathname
The name of the symbolic link.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Correct the condition indicated by the return code and reenter the request.

System Programmer Response: None.

BPXF169E SYMPATH VALUE IS MISSING FOR SYMLINK *pathname***.**

Explanation: Either SYMPATH was not specified OR no SYMPATH pathname was specified for the SYMLINK linkname.

In the message text:

pathname
The pathname of the symbolic link.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Reenter the request, specifying at least one SYMPATH pathname.

System Programmer Response: None.

BPXF170E RETURN CODE *return_code***, REASON CODE** *reason_code***. A SYMLINK FAILED FOR LINK NAME** *linkname***.**

Explanation: The BPXCOPY utility was unable to create a symbolic link with the specified name.

In the message text:

return_code
The return code received from the symlink request.

reason_code
The reason code received from the symlink request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

linkname
The name of the symlink.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem with the symlink request. Correct the error, and then reenter the request.

System Programmer Response: None.

BPXF171E RETURN CODE *return_code***, REASON CODE** *reason_code***. CANNOT REPLACE EXISTING SYMLINK** *linkname***.**

Explanation: The BPXCOPY utility was unable to create a symbolic link with the specified name. The name exists, but is different than the requested symbolic link, or not readable.

In the message text:

return_code
The return code received from the readlink request.

reason_code
The reason code received from the readlink request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

linkname
The name of the symlink.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem with the readlink request. Correct the error, and then reenter the request.

System Programmer Response: None.

BPXF172E CANNOT REPLACE EXISTING SYMLINK *linkname***.**

Explanation: The BPXCOPY utility was unable to create a symbolic link with the specified name. The name exists as a symlink, but the pathname in the existing symbolic link is different from the pathname requested.

In the message text:

linkname
The name of the symlink.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Remove the existing symbolic link, or specify a different SYMLINK linkname, and reenter the request.

System Programmer Response: None.

BPXF173E RETURN CODE *return_code*, **REASON CODE** *reason_code*. *attr* **ATTRIBUTE CANNOT BE SET FOR FILE** *pathname*.

Explanation: The BPXCOPY utility was unable to set the indicated attribute on the HFS file.

In the message text:

return_code
The return code received from the chattr request.

reason_code
The reason code received from the chattr request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

attr
The attribute requested —

APF|NOAPF|PROGCTL|NOPROGCTL|SHAREAS|NOSHAREAS.

pathname
The pathname of the HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem with the chattr request. Correct the error, and then reenter the request.

System Programmer Response: None.

BPXF174E RETURN CODE *return_code*, **REASON CODE** *reason_code*, **OBTAINING STATUS OF FILE** *pathname*.

Explanation: The system was unable to obtain the status of the file because of the condition indicated by the return code and the reason code shown.

In the message text:

return_code
The return code received from the stat request.

reason_code
The reason code received from the stat request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

pathname
The pathname of the HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the command ends.

Operator Response: None.

User Response: The return code and reason code that were returned with this message indicate what caused the problem. Correct the error, and then reenter the request.

System Programmer Response: None.

BPXF175E THE *attr* **ATTRIBUTE WAS NOT SET FOR FILE** *pathname*.

Explanation: The BPXCOPY utility was unable to set the indicated attribute on the HFS file. No return code was returned from the chattr system call.

In the message text:

attr
The attribute requested —

APF|NOAPF|PROGCTL|NOPROGCTL|SHAREAS|NOSHAREAS.

pathname
The pathname of the HFS file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Check that the file system containing the file supports the requested attribute, and that you have the security permissions required to set the attribute. Correct the error, and then reenter the request.

System Programmer Response: None.

BPXF176E SYMLINK VALUE IS MISSING FOR SYMPATH *pathname*.

Explanation: Either SYMLINK was not specified OR no SYMLINK linkname was specified for the SYMPATH pathname.

In the message text:

pathname
The pathname to be the contents of the symbolic link.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXFUCPY

System Action: Processing for the request ends.

Operator Response: None.

User Response: Reenter the request, specifying at least one SYMLINK linkname for each SYMPATH pathname.

System Programmer Response: None.

BPXF201I DOMAIN *domain-name* **WAS NOT ACTIVATED. FILE SYSTEM TYPE** *type*, **SPECIFIED IN** *member-name*, **IS NOT ACTIVE.**

Explanation: During OS/390 UNIX initialization, the system could not activate the specified domain. The file system type named on the NETWORK statement is not initialized.

In the message text:

domain-name
The domain name specified on the NETWORK statement in the BPXPRMxx parmlib member.

type
The value specified on the TYPE operand in the specified parmlib member.

member-name
The member name processed as a result of the START OMVS command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXVSINT

System Action: The domain is not activated. The system continues to process other NETWORK statements.

Operator Response: Contact the system programmer.

System Programmer Response: Verify that the FILESYSTYPE statement in the BPXPRMxx parmlib member defines the file system specified with the TYPE parameter on the NETWORK statement. Ask the operator to correct the problem in BPXPRMxx. IPL the system to start OS/390 UNIX with the revised member.

BPXF202I DOMAIN *domain-name* **WAS NOT ACTIVATED FOR FILE SYSTEM TYPE** *type***. RETURN CODE =** *return_code***, REASON CODE =** *reason_code*

Explanation: During OS/390 UNIX initialization, the system could not activate the specified domain.

In the message text:

domain-name
The domain name specified on a NETWORK statement in the BPXPRMxx parmlib member.

type
The value specified on the TYPE operand in the specified parmlib member.

return_code
The return code from the NETWORK request.

reason_code
The reason code from the NETWORK request. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXVSINT

System Action: The domain is not activated. The system continues to process other SYS1.PARMLIB statements.

Operator Response: Contact the system programmer.

System Programmer Response: Find the cause of the problem by looking at the return code and reason code. If there is a problem with SYS1.PARMLIB, correct it. IPL the system to start OS/390 UNIX with the revised member.

BPXF203I DOMAIN *domain-name* **WAS SUCCESSFULLY ACTIVATED.**

Explanation: During OS/390 UNIX initialization, a domain was successfully activated.

In the message text:

domain-name
The domain name specified on the NETWORK statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXVSINT

System Action: The domain was activated. The system continues to process other SYS1.PARMLIB statements.

Operator Response: None.

System Programmer Response: None.

BPXF204I TCP/IP ROUTING INFORMATION UNAVAILABLE FOR TRANSPORT DRIVER *tdname***. RETURN CODE =** *return_code***, REASON CODE =** *reason_code***.**

Explanation: While attempting to retrieve routing information from TCP/IP, an error was detected.

In the message text:

tdname
The name supplied on the SUBFILESYSTYPE parmlib entry that refers to the specific INET sockets physical file system that detected the error.

return_code
The return code obtained when attempting to retrieve routing information.

reason_code
The reason code obtained when attempting to retrieve routing information. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCTBL

System Action: The transport provider will be used in a degraded state.

Operator Response: Contact your system administrator.

System Programmer Response: Ensure that the version of the transport provider supports OS/390 UNIX's support of multiple transport drivers. After the correct versions are established, OS/390 UNIX routing information retrieval may be initiated by restarting the transport provider, or, in the case of IBM's TCP/IP, the OBEYFILE command may be issued to cause TCP/IP to re-read the TCP/IP profile dataset.

BPXF205I UNABLE TO ESTABLISH A CONNECTION TO TRANSPORT DRIVER *tdname*
FOR ROUTING INFORMATION. RETURN CODE = *return_code* **, REASON CODE =** *reason***.**

Explanation: A general error occurred when OS/390 UNIX attempted to make a connection to the transport driver named for the retrieval of routing information.

In the message text:

tdname
The name supplied on the SUBFILESYSTYPE parmlib entry that refers to the specific INET sockets physical file system that detected the error.

return_code
The return code obtained when attempting to retrieve routing information.

reason_code
The reason code obtained when attempting to retrieve routing information. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCTBL

System Action: The transport provider will be used in a degraded state.

Operator Response: Contact your system administrator.

System Programmer Response: Ensure that the version of the transport provider supports OS/390 UNIX's support of multiple transport drivers. After the correct versions are established, either the

transport provider must be restarted, or the system IPLed in order to start OS/390 UNIX.

BPXF206I ROUTING INFORMATION FOR TRANSPORT DRIVER *tdname* HAS BEEN INITIALIZED OR UPDATED.

Explanation: OS/390 UNIX Common INET support maintains simple routing information for each transport provider connected to Common INET. This message is issued after OS/390 UNIX has obtained and stored routing information for the named transport driver.

Some transport providers, such as IBM's TCP/IP, allow routing information to be updated without shutting down TCP/IP. If routing information is updated, OS/390 UNIX will update stored routing information and issue this message.

In the message text:

tdname
The name supplied on the SUBFILESYSTYPE parmlib entry that refers to the specific INET sockets physical file system for which routing information was obtained.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCTBL

System Action: The transport provider is fully functional through OS/390 UNIX Common INET support.

Operator Response: None

System Programmer Response: None

BPXF207I ROUTING INFORMATION HAS BEEN DELETED FOR TRANSPORT DRIVER *tdname*.

Explanation: OS/390 UNIX Common INET support maintains simple routing information for each transport provider connected to Common INET. This message is issued after OS/390 UNIX has deleted routing information for the named transport driver.

This message is issued when one of the following events occurs:

- The connection between a transport provider and OS/390 UNIX is severed.
- A software error occurs in the Common INET routing information manager.

In the message text:

tdname
The name supplied on the SUBFILESYSTYPE parmlib entry that refers to the specific INET sockets physical file system for which routing information has been deleted.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCTBL

System Action: The transport provider will be used in a degraded state or not used at all.

Operator Response: This message is expected if a transport provider is canceled or otherwise terminates. If this message is seen in conjunction with an OS/390 UNIX sortware error, notify the IBM Support Center.

System Programmer Response: This message is expected if a transport provider is canceled or otherwise terminates. If this message is seen in conjunction with an OS/390 UNIX sortware error, notify the IBM Support Center.

BPXF208I A SOCKETS PORT ASSIGNMENT CONFLICT EXISTS BETWEEN OPENEDITION MVS AND *name*.

Explanation: A bind request that specified port number 0 and Internet Protocol (IP) address INADDR_ANY failed because a port number that is reserved for use by OS/390 UNIX Common INET is currently being used by the named transport provider.

In the message text:

name
The name of the transport provider using the reserved port. This name was specified on a SUBFILESYSTYPE statement on the BPXPRMxx parmlib member that was used to start OS/390 UNIX.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCBND

System Action: The bind service failed. The system continues processing.

Operator Response: Contact your system programmer.

System Programmer Response: The port numbers assigned for binds that specify port number 0 and IP address INADDR_ANY are reserved for use in OS/390 UNIX with the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK statement for Common INET in the parmlib. The same port numbers must also be reserved on the named transport provider so they can be assigned by OS/390 UNIX. See the documentation for the named transport provider to determine how the port numbers are reserved.

If port numbers are specified for OS/390 UNIX, the same port numbers must be specified to the named transport provider.

If ports were reserved on the named transport provider for use with OS/390 UNIX, the same port numbers must be specified to OS/390 UNIX using the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK statement.

After changing these values, you must reIPL your system in order for the new numbers to take effect.

BPXF209I ALL OF THE OPENEDITION MVS RESERVED SOCKET PORTS ARE IN USE.

Explanation: A bind request that specified port number 0 and Internet Protocol (IP) address INADDR_ANY failed because all of the port numbers reserved for those binds are currently in use.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCBND

System Action: The bind request failed. The system continues processing.

Operator Response: Contact your system programmer.

System Programmer Response: The port numbers that are assigned for binds that specify port number 0 and IP address INADDR_ANY are reserved for use in OS/390 UNIX. They are specified on the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK statement for Common INET in the parmlib member used to start OS/390 UNIX. You must increase the number of ports available by either specifying the INADDRANYCOUNT operand (if it was not specified), or specifying a larger number for that parameter. Make sure that you also specify that same larger number on each of the transport providers. After changing these values, you must reIPL your system in order for the new numbers to take effect.

BPXF210I A BIND REQUEST COULD NOT BE PROCESSED. NO PORT 0, INADDR_ANY PORTS WERE RESERVED.

Explanation: A bind request that specified port number 0 and Internet Protocol (IP) address INADDR_ANY failed because there are no port numbers reserved for those binds.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCBND

System Action: The bind request failed. The system continues processing.

Operator Response: Contact your system programmer.

System Programmer Response: To reserve port numbers that will be assigned for port 0, INADDR_ANY binds, use the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK parmlib statement. The same port numbers must also be reserved on each of the transport providers specified on a SUBFILESYSTYPE parmlib statement. See the documentation for those transport providers to determine how the port numbers are reserved.

After changing these values, you must reIPL your system in order for the new numbers to take effect.

BPXF211I A DUPLICATE NETWORK STATEMENT WAS FOUND FOR DOMAINNAME *domain-name***. THE DUPLICATE ENTRY WAS FOUND IN PARMLIB MEMBER** *member-name* **AND SPECIFIED A TYPE OF** *type***. THE DUPLICATE WAS IGNORED**

Explanation: During OS/390 UNIX initialization, the system found two NETWORK statements with the same DOMAINNAME specified. The second is a duplicate and is ignored.

In the message text:

domain-name
The domain name specified on the NETWORK statement in the BPXPRMxx parmlib member.

member-name
The member name processed as a result of the START OMVS command.

type
The value specified on the TYPE operand in the specified parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTVSINT

System Action: The duplicate record is ignored. The system continues to process.

Operator Response: Contact the system programmer.

System Programmer Response: Verify that only one NETWORK statement has been created for each DOMAINNAME. Correct the error. IPL the system to start OS/390 UNIX with the revised member.

BPXF212I NEITHER INADDRANYPORT NOR INADDRANYCOUNT WAS SPECIFIED ON THE NETWORK COMMAND FOR TYPE *type* **IN MEMBER** *member-name***. THESE VALUES HAVE BEEN DEFAULTED TO INADDRANYPORT(63000) AND INADDRANYCOUNT(1000).**

Explanation: During OS/390 UNIX initialization, the system found a NETWORK statement for common Inet in the named member which did not specify either INADDRANYPORT or INADDRANYCOUNT. Therefore default values will be assigned.

In the message text:

type
The value specified on the TYPE operand in the specified parmlib member.

member-name
The member name processed as a result of the START OMVS command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTCNWK

System Action: Processing will continue with the newly assigned default values.

Operator Response: Contact the system programmer.

System Programmer Response: Verify that the NETWORK statement correctly reflects the values required for INADDRANY and INADDRANYCOUNT. Specify the values needed and re-IPL the system to start OS/390 UNIX with the revised member.

BPXG2001I Address space contains residual OpenMVS data

Explanation: The address space being processed by the CBSTAT command was dubbed by a prior copy of the OMVS kernel. As of OS/390 V1R3, the OMVS kernel is permanent and this message should not occur.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXGMCBS

System Action: Any function requested from this address space to the OS/390 UNIX kernel will be rejected.

Operator Response: If the system still exists from the time of this dump, cancel this address space.

Application Programmer Response: Terminate the application when this problem occurs.

System Programmer Response: Do not stop and restart the OMVS kernel address space while applications are still using it. Terminate the applications first.

BPXI002I *procname* **IS ALREADY ACTIVE**

Explanation: A request to start OS/390 UNIX was received. However, it is already active.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINIT

System Action: The system ignores the start request.

Operator Response: None.

System Programmer Response: None.

BPXI003I OPENMVS MUST BE STARTED AS A STARTED TASK, JOB *jobname* IGNORED

Explanation: The named batch job attempted to start OS/390 UNIX. It must be started as a STARTED task.

In the message text:

jobname
The name of the batch job.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINIT

System Action: The system ignored the request to start OS/390 UNIX.

Operator Response: Enter a START operator command to start OS/390 UNIX.

System Programmer Response: None.

BPXI004I *procname* INITIALIZATION COMPLETE

Explanation: OS/390 UNIX initialization is now complete.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPINPR

System Action: OS/390 UNIX is ready for work.

Operator Response: None.

System Programmer Response: None.

BPXI005I *procname* TERMINATION IS COMPLETE

Explanation: OS/390 UNIX processing is ending in response to a system command or as a result of a serious system problem.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXRRTRM

System Action: OS/390 UNIX terminates.

Operator Response: Contact your system programmer if there are error messages accompanying this message.

System Programmer Response: No action is required if this is a normal termination of OS/390 UNIX processing. If this is an error situation, see the messages associated with the error.

BPXI006I ERROR IN PARMLIB MEMBER *memname* ON LINE *line-number*, POSITION *position-number*. INPUT PARAMETER VALUE IS OUT OF THE ALLOWED RANGE OF *minimum-number* TO *maximum-number*. A SYSTEM VALUE OF *parm-value* IS USED. DETECTING MODULE IS *detmod*. INPUT LINE: *input-line*

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

minimum-number
The low value of the allowed range.

maximum-number
The high value of the allowed range.

parm-value
The value that the system is using for the input parameter.

detmod
The module that detected the error.

input-line
The text of the line containing the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system ignores the erroneous statement. The system checks the rest of the parmlib member to find any other errors.

Operator Response: Contact the system programmer.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI007I ERROR IN PARMLIB MEMBER *memname* ON LINE *line-number*, POSITION *position-number*. *text*

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

default-value
The system default value for the erroneous parameter.

detmod
The module that detected the error.

input-line
The text of the line containing the error.

INPUT PARAMETER VALUE IS NOT NUMERIC. THE SYSTEM DEFAULT VALUE OF *default-value* IS USED. DETECTING MODULE IS *detmod*. INPUT LINE: *input-line*

The specified parameter value contains nonnumeric characters.

INPUT PARAMETER VALUE IS INCORRECT. THE SYSTEM DEFAULT VALUE OF *default-value* IS USED. DETECTING MODULE IS *detmod*. INPUT LINE: *input-line*

The specified parameter value is incorrect or is null.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system ignores the erroneous parameter. The system uses the default value for this parameter. The system checks the rest of the parmlib member to find any other errors.

Operator Response: None.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI008I **ERROR IN PARMLIB MEMBER** *memname* **ON LINE** *line-number***, POSITION** *position-number***. THE NUMBER OF VALUES SPECIFIED FOR THE KEYWORD** *keyword* **EXCEEDS THE MAXIMUM NUMBER ALLOWED.**

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

keyword
The keyword that has too many values.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMY1

System Action: The system ignores the extra values specified and checks the rest of the parmlib member to find any other errors.

Operator Response: Contact the system programmer.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI009I **ERROR IN PARMLIB MEMBER=***memname* **ON LINE** *line-number***, POSITION** *position-number***. INPUT KEYWORD VALUE IS INCORRECT. INPUT DATA LENGTH OF FROM** *minimum-length* **TO** *maximum-length* **CHARACTERS IS EXPECTED. DETECTING MODULE IS** *detmod***. INPUT LINE:** *input-line*

Explanation: The system encountered an error in a parmlib member. The input length of a keyword or parameter value is too long or short or null.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

minimum-length
The minimum number of input characters expected.

maximum-length
The maximum number of input characters expected.

detmod
The name of the module that detected the situation.

input-line
The text of the line containing the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system may ignore the erroneous statement or it may stop initialization after parsing completes. The system checks the rest of the parmlib member to find any other errors.

Operator Response: None.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI010I **ERROR IN PARMLIB MEMBER=***memname* **ON LINE** *line-number***, POSITION** *position-number***. REQUIRED KEYWORD --** *keyword-name* **-- IS MISSING FROM THE** *parm-name* **PARAMETER. DETECTING MODULE IS** *detmod***. INPUT LINE:** *input-line*

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

keyword-name
The name of the missing keyword.

parm-name
The name of the parmlib parameter containing the keyword.

detmod
The name of the module that detected the error.

input-line
The text of the line containing the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system ignores the erroneous statement and checks the rest of the parmlib member to find any other errors.

Operator Response: None.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI011I **ERROR IN PARMLIB MEMBER=***memname* **ON LINE** *line-number***, POSITION** *position-number***. KEYWORDS** *keyword-name1* **AND** *keyword-name2* **ARE MUTUALLY EXCLUSIVE FOR THE** *parm-name* **PARAMETER. ONLY ONE OF THE KEYWORDS CAN BE SPECIFIED, NOT BOTH. DETECTING MODULE IS** *detmod***. INPUT LINE:** *input-line*

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

keyword-name1
The name of the first keyword.

keyword-name2
The name of the second keyword.

parm-name
The name of the parmlib parameter containing the keyword.

detmod
The name of the module that detected the error.

input-line
The text of the line containing the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system ignores the erroneous statement and checks the rest of the parmlib member to find any other errors.

Operator Response: None.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI012I ERRORS IN PARMLIB MEMBER=*memname***, REFER TO HARDCOPY LOG.**

Explanation: The system encountered errors in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINPRM

System Action: The system wrote the error messages to the hardcopy log. Processing continues. The operator is prompted for a new OMVS= system parameter specification.

Operator Response: None. In order to have the system complete the IPL, it is necessary to provide a valid OMVS= specification. If you know of a valid BPXPRMxx parmlib member, then specify it when prompted. If no valid BPXPRMxx members are available, then specify OMVS=DEFAULT.

System Programmer Response: Look in the hardcopy log for messages explaining the errors in the parmlib member. Correct the errors in the parmlib member before using it again.

BPXI013I INPUT PARAMETER FOR THE START *jobname* **COMMAND IS INCORRECT. PARAMETER MUST BE NO MORE THAN 2 CHARACTERS. INPUT PARAMETER: OMVS=***memname-suffix*

Explanation: The command to start OS/390 UNIX specified an incorrect parmlib member name parameter, (OMVS=xx). The parameter should be no more than two characters. The two characters are appended to BPXPRM to form a name for the parmlib member.

In the message text:

jobname
The name of the job that started OS/390 UNIX.

memname-suffix
The specified parmlib member name suffix with the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINPRM

System Action: The system does not process the START command.

Operator Response: Start OS/390 UNIX with the correct member name parameter.

System Programmer Response: None.

BPXI014I ERRORS FOUND IN PROCESSING PARMLIB MEMBER *memname***. UNEXPECTED RETURN CODE** *return_code* **FROM IEEMB878.**

Explanation: An unexpected return code occurred while the system was processing the parmlib member for OS/390 UNIX during initialization.

In the message text:

memname
The name of the parmlib member in process

return_code
The unexpected error return code from IEEMB878. For an explanation of the code, see *OS/390 MVS System Codes*

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINPRM

System Action: The system does not initialize OS/390 UNIX.

Operator Response: If the problem recurs, contact the system programmer.

System Programmer Response: Determine the cause of the error. If necessary, contact the IBM Support Center.

BPXI015I *procname* **CANNOT BE STARTED. OPENMVS IS IN TERMINATION.**

Explanation: A request to start OS/390 UNIX is received. However, it is in the process of terminating.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINIT

System Action: The system ignores the start request.

Operator Response: None.

System Programmer Response: OS/390 UNIX is in the process of terminating. Termination must complete before it can be restarted.

BPXI016I *procname* **IS BEGINNING TO TERMINATE**

Explanation: OS/390 UNIX processing is beginning to terminate in response to a system command or as a result of a serious system problem.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINIT

System Action: OS/390 UNIX terminates. Some address spaces that are using OS/390 UNIX may experience abends; this is normal.

Operator Response: None.

System Programmer Response: No action is required if this is a normal ending of OS/390 UNIX processing. If this is an error, see the messages associated with the error.

BPXI017I THE /ETC/INIT PROCESS COULD NOT BE INITIATED. *system_call* **RETURN CODE** *return_code* **REASON CODE** *reason_code*

Explanation: The system encountered an error while creating the process for **/etc/init** or **/usr/sbin/init**.

In the message text:

system_call
The callable service that failed.

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPINPR

System Action: The system ends the process for **/etc/init** or **/usr/sbin/init**.

Operator Response: Contact the system programmer.

System Programmer Response: Examine the return and reason code for the service that ended in error to determine the reason for the error.

BPXI018I THE /ETC/INIT PROCESS ENDED IN ERROR, EXIT STATUS *exit_status*

Explanation: The **/etc/init** or **/usr/sbin/init** process encountered an error.

In the message text:

exit_status
The exit status for the **/etc/init** or **/usr/sbin/init** process. see *OS/390 UNIX System Services Messages and Codes* for **/etc/init** exit status codes.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPINPR

System Action: The system continues normally.

Operator Response: None.

System Programmer Response: Examine the exit status displayed in the message to determine the reason the **/etc/init** or **/usr/sbin/init** process ended in error. See *OS/390 UNIX System Services Messages and Codes* for information on exit status values.

BPXI019I *procname* **IS TERMINATING DUE TO AN ERROR IN A KERNEL FUNCTION**

Explanation: OS/390 UNIX processing is beginning to terminate in response to an error in one of its functions.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPRIT

System Action: OS/390 UNIX terminates.

Operator Response: None.

System Programmer Response: See the error messages associated with the error.

BPXI020I *procname* **IS TERMINATING BECAUSE THE INIT PROCESS (PID = 1) HAS ENDED**

Explanation: OS/390 UNIX processing is beginning to terminate, because the initialization process has terminated.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPRIT

System Action: OS/390 UNIX terminates.

Operator Response: None.

System Programmer Response: See the error messages associated with the error.

BPXI021I AN ERROR OCCURRED WHILE SEARCHING FOR SYSTEM MODULE = *modulename***. UNEXPECTED RETURN CODE** *return_code* **FROM CSVQUERY.**

Explanation: The system encountered an error while attempting to locate the identified system module during OS/390 UNIX initialization.

In the message text:

modulename
The name of the missing system module

return_code
The unexpected error return code from CSVQUERY. For an explanation of the return code, see the description of the CSVQUERY macro in *OS/390 MVS Programming: Authorized Assembler Services Reference ALE-DYN* .

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPRIT

System Action: The system ends the OS/390 UNIX initialization.

Operator Response: Contact the system programmer.

System Programmer Response: The missing module must reside in SYS1.LPALIB. Determine why the identified module cannot be located in SYS1.LPALIB. If necessary, contact the IBM Support Center.

BPXI022I ERROR IN PARMLIB MEMBER *memname* **ON LINE** *line-number***, POSITION** *position-number***.** *text*

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

INPUT PARAMETER VALUE IS NOT NUMERIC. THE VALUE IS IGNORED.

The specified parameter value contains nonnumeric characters.

INPUT PARAMETER VALUE IS INCORRECT. THE VALUE IS IGNORED.

The specified parameter value is incorrect or is null.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system ignores the erroneous parameter. The system checks the rest of the parmlib member to find any other errors.

Operator Response: None.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI023I ERROR IN PARMLIB MEMBER *memname* **ON LINE** *line-number*, **POSITION** *position-number*. **INPUT PARAMETER VALUE IS OUT OF THE ALLOWED RANGE OF** *minimum-number* **TO** *maximum-number*. **THE VALUE IS IGNORED.**

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

minimum-number
The low value of the allowed range.

maximum-number
The high value of the allowed range.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system ignores the erroneous statement. The system checks the rest of the parmlib member to find any other errors.

Operator Response: Contact the system programmer.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI024I ERROR IN PARMLIB MEMBER=*memname* **ON LINE** *line-number*, **POSITION** *position-number*. **INPUT KEYWORD VALUE IS INCORRECT. THE FIRST CHARACTER MUST BE ALPHABETIC.**

Explanation: The system encountered an error in a parmlib member. The first character of the keyword value was not alphabetic.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system stops initialization after parsing completes. The system checks the rest of the parmlib member to find any other errors.

Operator Response: None.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI025I ERROR IN PARMLIB MEMBER=*memname* **ON LINE** *line-number*. **PARTITIONED DATASET IS INCORRECT. REASON:** *text*

Explanation: The system encountered an error in a parmlib member. The input length of a keyword or parameter partitioned dataset was incorrect.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

detmod
The name of the module that detected the situation.

input-line
The text of the line containing the error.

MEMBER LENGTH IS NOT 1-8. DETECTING MODULE IS *detmod*. **INPUT LINE:** *input-line*

The member length is not 1-8.

INVALID CHARACTER DETECTED IN MEMBER NAME. DETECTING MODULE IS *detmod*. **INPUT LINE:** *input-line*

An invalid character was detected in the member name.

FIRST CHARACTER IN MEMBER NAME NOT VALID. DETECTING MODULE IS *detmod*. **INPUT LINE:** *input-line*

The first character in the member name is not valid.

INVALID CHARACTER DETECTED IN DATASET NAME. DETECTING MODULE IS *detmod*. **INPUT LINE:** *input-line*

An invalid character was detected in the dataset name.

FIRST CHARACTER IN DATASET NAME NOT VALID. DETECTING MODULE IS *detmod***. INPUT LINE:** *input-line*

The first character in the dataset name is not valid.

FIRST CHARACTER IN A DATASET SEGMENT NOT VALID. DETECTING MODULE IS *detmod***. INPUT LINE:** *input-line*

The first character in a dataset segment is not valid.

A DATASET SEGMENT LENGTH IS NOT 1-8. DETECTING MODULE IS *detmod***. INPUT LINE:** *input-line*

A dataset segment length is not 1-8.

DATASET NAME LENGTH IS NOT 1-44. DETECTING MODULE IS *detmod***. INPUT LINE:** *input-line*

The dataset name length is not 1-44.

MISSING RIGHT PARENTHESIS. DETECTING MODULE IS *detmod***. INPUT LINE:** *input-line*

The partition dataset name is missing a right parenthesis.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMY1

System Action: The system may ignore the erroneous statement or it may stop initialization after parsing completes. The system checks the rest of the parmlib member to find any other errors.

Operator Response: None.

System Programmer Response: Correct the error in the parmlib member before using it again.

BPXI026I THE ETCINIT JOB COULD NOT BE STARTED. *system_call* **RETURN CODE** *return_code* **REASON CODE** *reason_code*

Explanation: The system encountered an error while creating the process for **/etc/init** or **/usr/sbin/init**.

In the message text:

system_call
The callable service that failed.

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPINPR

System Action: The system ends the process for **/etc/init** or **/usr/sbin/init**.

Operator Response: Contact the system programmer.

System Programmer Response: Examine the return and reason code for the service that ended in error to determine the reason for the error.

BPXI027I THE ETCINIT JOB ENDED IN ERROR, EXIT STATUS *exit_status*

Explanation: The **/etc/init** or **/usr/sbin/init** process encountered an error.

In the message text:

exit_status
The exit status for the **/etc/init** or **/usr/sbin/init** process. see *OS/390 UNIX System Services Messages and Codes* for /etc/init exit status codes.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPINPR

System Action: The system continues normally.

Operator Response: None.

System Programmer Response: Examine the exit status displayed in the message to determine the reason the /etc/init or **/usr/sbin/init** process ended in error. See *OS/390 UNIX System Services Messages and Codes* for information on exit status values.

BPXI028E OPENEDITION SERVICES ARE NOT AVAILABLE.

Explanation: OS/390 UNIX processing has ended as a result of a serious system problem.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXRRTRM

System Action: The system will continue, but OS/390 UNIX services will not be functional.

Operator Response: Contact your system programmer. After the system programmer fixes the problem, reIPL the system to regain OS/390 UNIX services.

System Programmer Response: Correct the conditions that caused the failure. Ask the operator to reIPL the system.

BPXI029I AN OMVS= PARMLIB MEMBER WAS NOT FOUND OR IS IN ERROR.

Explanation: OS/390 UNIX parmlib parsing has encountered a syntax error in one of the specified parmlib members or the specified parmlib member does not exist. Once the system is IPLed, check the hardcopy log for the errors.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINRIM

System Action: The system prompts for a new OMVS= parmlib specification.

Operator Response: Specify a new OMVS= parmlib specification or take the system default by specifying OMVS=DEFAULT.

System Programmer Response: Correct the parmlib member that caused the failure. Ask the operator to reIPL the system.

BPXI030I THE OMVS= PARAMETER WAS FOUND TO HAVE A SYNTAX ERROR.

Explanation: OS/390 UNIX parmlib parsing has encountered a syntax error in the OMVS= parmlib parameter.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINRIM

System Action: The system prompts for a new OMVS= parmlib specification.

Operator Response: Specify a new OMVS= parmlib specification or take the system default by specifying OMVS=DEFAULT.

System Programmer Response: Correct the OMVS= parmlib parameter in the IEASYSPxx member used to IPL the system.

BPXI031E BPXOINIT FAILED TO INITIALIZE. RETURN CODE *return_code* **REASON CODE** *reason_code*

Explanation: The system encountered an error while initializing the BPXOINIT process.

In the message text:

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPINPR

System Action: OMVS will fail to initialize.

Operator Response: Contact the system programmer.

System Programmer Response: Examine the return and reason code for why the BPXOINIT process could not be initialized. Once the error is corrected the system must be re-IPLed to get OMVS started.

BPXI032E FORK SERVICE HAS BEEN SHUTDOWN SUCCESSFULLY. ISSUE F BPXOINIT,RESTART = FORKS TO RESTART FORK SERVICE.

Explanation: This message is in response to a MODIFY BPXOINIT, SHUTDOWN = FORKS system command and indicates that the SHUTDOWN of FORKS was successful.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINSHU

System Action: All forked processes are terminated. Any new attempts to FORK will be suspended until a MODIFY BPXOINIT, RESTART = FORKS has been requested.

Operator Response: Perform any tasks that required the FORKS to be suspended, such as recycling JES2. Then issue MODIFY BPXOINIT, RESTART = FORKS to restore FORKS service.

System Programmer Response: None.

BPXI033E FORK SERVICE SHUTDOWN HAS FAILED. ISSUE F BPXOINIT,RESTART = FORKS TO RESTART FORK SERVICE; OR RE-IPL.

Explanation: This message is in response to a MODIFY BPXOINIT,SHUTDOWN = FORKS system command and indicates that the SHUTDOWN of FORKS could not terminate all FORKed processes.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINSHU

System Action: An attempt was made to terminate all FORKed processes. Not all FORKed processes were terminated. Any new attempts to FORK will be suspended until a MODIFY BPXOINIT,RESTART = FORKS has been requested.

Operator Response: Perform D OMVA,A = All to determine which FORKed processes must be cancelled by the operator.

System Programmer Response: Try to determine why all FORKed processes were not terminated. If cause cannot be found, have operator either issue a MODIFY BPXOINIT,RESTART = FORKS to restore FORK service, or schedule a re-IPL of the system resources that prompted the shutdown of the FORK service.

BPXI034I BPXOINIT MUST BE STARTED BY OMVS INITIALIZATION, STARTED PROC *procname* **IGNORED.**

Explanation: The OS/390 UNIX initialization process (BPXOINIT) must be started by the OMVS kernel. Do not use the START operator command to start BPXOINIT.

In the message text:

procname
The named proc attempted to start the OS/390 UNIX initial process. It must be started by the system.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPINPR

System Action: The system ignored the request to start the OS/390 UNIX initial process. The UNIX initial process is started by the system, do not use the START operator command to start it.

Operator Response: None.

System Programmer Response: None.

BPXI035E INITIAL PROCESS USERID NOT UID = 0. CHANGE TO UID = 0 AND RE-IPL.

Explanation: The userid associated with system procedure, BPXOINIT, must have UID=0 in the OMVS segment in the security database.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPINPR

System Action: OS/390 UNIX will fail to initialize.

Operator Response: Contact the system programmer.

System Programmer Response: Change the userid or the uid of the userid associated with system process BPXOINIT to have UID=0 and then have the operator re-IPL to recover OS/390 UNIX services. See *OS/390 UNIX System Services Planning* for details.

BPXM001I BPXBATCH FAILED DUE TO AN INCORRECT *ddname* **ALLOCATION WITH A PATH OPTION WRITE OR READ/WRITE SPECIFIED.**

Explanation: You specified an incorrect allocation path option for STDIN or STDENV. BPXBATCH requires either a path option of read only or no path options for STDIN and STDENV, unless STDENV represents an MVS data set.

In the message text:

ddname
One of the following:

STDIN
DDNAME STDIN

STDENV
DDNAME STDENV

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Change STDIN or STDENV allocation to path option ORDONLY or remove the path option.

System Programmer Response: None.

BPXM002I BPXBATCH FAILED DUE TO AN ERROR IN ALLOCATION OF *ddname*. ALLOCATION PATH OPTIONS MUST BE WRITE ONLY.

Explanation: You specified an incorrect allocation path option for STDOUT or STDERR. BPXBATCH requires either a path option of WRITE or no path options for STDOUT and STDERR.

In the message text:

ddname
One of the following:

STDOUT
DDNAME STDOUT

STDERR
DDNAME STDERR

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Change STDOUT or STDERR allocation to path option OWRONLY, or remove the path option.

System Programmer Response: None.

BPXM004I BPXBATCH FAILED BECAUSE THE CALLER OR CALLING PROGRAM DID NOT HAVE A PSW SECURITY KEY OF 8.

Explanation: You must call BPXBATCH from an address space with a PSW security key of 8.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Invoke BPXBATCH from an address space with a PSW security key of 8.

System Programmer Response: None.

BPXM006I BPXBATCH FAILED BECAUSE EXEC (BPX1EXC) OF /BIN/LOGIN FAILED WITH RETURN CODE *return_code* REASON CODE *reason_code*

Explanation: The system encountered an error while running BPXBATCH.

In the message text:

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: None.

System Programmer Response: BPXBATCH requires program **/bin/login**.

BPXM007I BPXBATCH FAILED DUE TO AN ERROR FROM OPENMVS CALLABLE SERVICE *system_call* WITH RETURN CODE *return_code* REASON CODE *reason_code*

Explanation: BPXBATCH encountered an error while attempting to use an OS/390 UNIX callable service.

In the message text:

system_call
The callable service that failed.

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Look up the return code and reason code in *OS/390 UNIX System Services Messages and Codes* to determine why the OS/390 UNIX callable service failed.

System Programmer Response: None.

BPXM008I BPXBATCH FAILED BECAUSE EXEC (BPX1EXC) OF THE PROGRAM NAME FAILED WITH RETURN CODE *return_code* REASON CODE *reason_code*.

Explanation: BPXBATCH encountered an error when trying to issue an EXEC (BPX1EXC) callable service to the program name specified. An incorrect program name may have been specified.

In the message text:

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Look up the return code and reason code to determine why the BPX1EXC callable service (EXEC) failed. Verify the program name exists in the path specified.

System Programmer Response: None.

BPXM009I BPXBATCH FAILED BECAUSE OPEN (BPX1OPN) FOR *ddname* FAILED WITH RETURN CODE *return_code* REASON CODE *reason_code*

Explanation: BPXBATCH encountered an error while attempting to open STDIN, STDOUT, STDERR, or STDENV.

In the message text:

ddname
One of the following:

STDIN
DDNAME STDIN

STDOUT
DDNAME STDOUT

STDERR
DDNAME STDERR

STDENV
DDNAME STDENV

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Look up the return code and reason code to determine why the OS/390 UNIX callable service open (BPX1OPN) failed. Examine either the TSO/E ALLOCATE commands, JCL DD statements, or dynamic allocation that defined STDIN, STDOUT, STDERR, or STDENV. A PATH that does not exist may have been specified or you may not have authorization to access the file. Authorization failure may have been caused by specifying OCREAT without specifying PATHMODE. If a file path was not specified, verify that the default file path **/dev/null** exists.

System Programmer Response: None.

BPXM010I BPXBATCH FAILED BECAUSE THE PARAMETERS DID NOT START WITH SH OR PGM.

Explanation: If a parameter list is used for BPXBATCH, then SH or PGM must be the first parameters specified.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: BPXBATCH requires that parameters start with SH or PGM. Reissue BPXBATCH with either no parameters or parameters that start with SH or PGM.

System Programmer Response: None.

BPXM011I BPXBATCH FAILED BECAUSE THE PARAMETERS SPECIFIED PGM WITHOUT A PROGRAM NAME AFTER PGM.

Explanation: If a BPXBATCH parameter list is specified with PGM first, a program name must be specified after PGM.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: BPXBATCH requires that a program name be specified after PGM.

System Programmer Response: None.

BPXM012I BPXBATCH FAILED BECAUSE OPEN FOR STDENV FAILED WITH RETURN CODE *return_code*

Explanation: BPXBATCH encountered an error while attempting to open STDENV, which describes an MVS data set.

In the message text:

return_code
The failure return code from OPEN.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Look up the return code to determine why the data set OPEN failed. Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined STDENV. Ensure that the DCB attributes of the data set are correct.

System Programmer Response: None.

BPXM013I BPXBATCH FAILED DUE TO AN INCORRECT *text*

Explanation: BPXBATCH detected a format error for STDENV, which describes an MVS data set.

In the message text:

DATA SET ORGANIZATION FOR STDENV.
Indicates that a data set organization other than sequential or PDS was specified for STDENV.

RECORD FORMAT FOR STDENV.
Indicates that a record format other than fixed or variable (non-spanned) was specified for STDENV.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined STDENV. Ensure that the associated data set is a fixed or variable (non-spanned) sequential data set or PDS member.

System Programmer Response: None.

BPXM014I BPXBATCH FAILED BECAUSE READ (BPX1RED) FOR STDENV FAILED WITH RETURN CODE *return_code* **REASON CODE** *reason_code*

Explanation: BPXBATCH encountered an error while attempting to read STDENV.

In the message text:

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Look up the return code and reason code to determine why the OS/390 UNIX callable service READ (BPX1RED) failed.

System Programmer Response: None.

BPXM015I BPXBATCH FAILED BECAUSE RETURN CODE *return_code* **WAS RECEIVED DURING AN ATTEMPT TO OBTAIN STORAGE FOR A BUFFER.**

Explanation: BPXBATCH made a request to obtain storage. The request failed for the reason identified by the return code.

In the message text:

return_code
The return code received when storage was requested.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: If the problem persists, increase the region size for BPXBATCH. This may also indicate that an excessively large environment variable file is specified by STDENV. If this is the case, try to reduce the size of the environment variable file.

System Programmer Response: None.

BPXM016I BPXBATCH FAILED BECAUSE AN MVS PDS WITH NO MEMBER NAME WAS SPECIFIED FOR STDENV.

Explanation: BPXBATCH cannot use STDENV, because it specifies an MVS PDS with no member name.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined STDENV. Ensure that a member name is specified for the associated PDS.

System Programmer Response: None.

BPXM017I BPXBATCH FAILED BECAUSE THE PATH SPECIFIED FOR STDENV IS A DIRECTORY.

Explanation: BPXBATCH cannot use STDENV, because the path it specifies is a directory instead of a text file.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined STDENV. Ensure that the path name specifies a text file and not a directory.

System Programmer Response: None.

BPXM018I BPXBATCH FAILED BECAUSE SPAWN (BPX1SPN) OF /BIN/LOGIN FAILED WITH RETURN CODE *return_code* **REASON CODE** *reason_code*

Explanation: The system encountered an error while running BPXBATCH.

In the message text:

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: None.

System Programmer Response: BPXBATCH requires program **/bin/login**.

BPXM019I BPXBATCH FAILED BECAUSE SPAWN (BPX1SPN) OF THE PROGRAM NAME FAILED WITH RETURN CODE *return_code* **REASON CODE** *reason_code*

Explanation: BPXBATCH encountered an error when trying to issue a SPAWN (BPX1SPN) callable service to the program name specified. An incorrect program name may have been specified.

In the message text:

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Look up the return code and reason code to determine why the BPX1SPN callable service

(SPAWN) failed. Verify the program name exists in the path specified.

System Programmer Response: None.

BPXM020I BPXBATCH FAILED BECAUSE MVSPROCCLP (BPX1MPC) FAILED WITH RETURN CODE *return_code* **REASON CODE** *reason_code*

Explanation: The service failed to cleanup process resources.

In the message text:

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: None.

System Programmer Response: None.

BPXM021E THE TARGET OF *keyword=* **IS NOT RECOGNIZED. THE EXPECTED FORMAT FOR THIS OPERAND IS:** *keyword=***PID.TID OR** *keyword=***PID WHERE PID IS 1-10 DIGIT DECIMAL PROCESS IDENTIFIER AND TID IS 1-16 HEXADECIMAL THREAD IDENTIFIER**

Explanation: The argument that followed the referenced keyword was not recognized.

In the message text:

keyword=
The keyword that precedes unrecognized operand.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: Reissue the MODIFY command with the argument corrected.

System Programmer Response: None.

BPXM022E MODIFY SYNTAX ERROR; *badparm* **WAS FOUND WHERE ONE OF THE FOLLOWING WAS EXPECTED:** *parms n n*

Explanation: The system found an unexpected keyword on a MODIFY command.

In the message text:

badparm
The unexpected parameter.

parms
the expected keywords.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: Reissue the MODIFY command with the keyword corrected.

System Programmer Response: None.

BPXM023I *loginnametext*

Explanation: An application has issued a message to the operator.

In the message text:

loginname
Userid who issued WTO request via BPX1CCS syscall.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: None.

System Programmer Response: None.

BPXM024I CONFLICTING PARAMETERS ON MODIFY COMMAND

Explanation: Conflicting parameters were used on the modify command. For more information, see MODIFY command in *OS/390 MVS System Commands*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: Correct the parameters and reissue the MODIFY command.

System Programmer Response: None.

BPXM025I PID MUST BE IN THE RANGE 2 - 4294967294.

Explanation: User entered a PID that is outside range of valid PIDs.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: Correct the PID and reissue the command.

System Programmer Response: None.

BPXM026I THE TARGET OF *keyword***,** *identifier***, WAS NOT FOUND.**

Explanation: The process and/or thread specified on the MODIFY command was not found.

In the message text:

keyword
The keyword specified on MODIFY command.

identifier
Pid or pid.tid specified on MODIFY command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: Reenter the command with the correct pid or pid.tid. Process and thread identifiers can be displayed via the DISPLAY OMVS command.

System Programmer Response: None.

BPXM027I COMMAND ACCEPTED.

Explanation: The command was accepted.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: System will initiate the requested action.

Operator Response: None.

System Programmer Response: None.

BPXM028I STOP REQUEST WAS IGNORED BY *name*.

Explanation: A stop request was received by a process that OMVS needs to continue running. Therefore the stop request was ignored.

In the message text:

name
jobname of the process where the STOP was attempted.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRLIS

System Action: None.

Operator Response: None.

System Programmer Response: None.

BPXM029I APPL= KEYWORD WAS IGNORED BY *name*.

Explanation: A MODIFY command with the APPL= keyword was received by a process that did not expect it. The command was ignored.

In the message text:

name
jobname of the process on MODIFY command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRLIS

System Action: None.

Operator Response: None.

System Programmer Response: None.

BPXM030I ERROR PROCESSING THE USERIDALIASTABLE - *aliasfile functionstatusreturn_code* REASON CODE *reason_code text*

Explanation: During OS/390 UNIX userid/group alias table processing, an error occurred trying to access the new or changed alias file.

In the message text:

aliasfile
The USERIDALIASTABLE file name (up to the first 44 characters).

functionstatus
One of the following:

STAT FAILED - RETURN CODE
STAT failed against the specified file.

OPEN FAILED - RETURN CODE
OPEN failed against the specified file.

READ FAILED - RETURN CODE
READ failed against the specified file.

LSEEK FAILED - RETURN CODE
LSEEK failed against the specified file.

return_code
The return code from the SYSCALL.

reason_code
The reason code from the SYSCALL. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

THE CONTENTS OF THE PREVIOUS TABLE WILL CONTINUE TO BE USED.

NO ALIAS TABLE IS IN USE AT THIS TIME.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRUAT

System Action: The contents of the old table will be used. If there was a STAT error, then no table will be used.

Operator Response: Contact the system programmer.

System Programmer Response: Verify that the specified alias file exists and is accessible.

BPXM031I ERROR PROCESSING THE USERIDALIASTABLE - *aliasfile errorfoundline-number text*

Explanation: During OS/390 UNIX userid/group alias table processing, a syntax error was found in the specified alias file.

In the message text:

aliasfile
The USERIDALIASTABLE file name (up to the first 44 characters).

errorfound
One of the following:

SYNTAX ERROR IN FILE - INVALID COMMENT AT LINE
A comment line has incorrect delineators.

SYNTAX ERROR IN FILE - INVALID TAG AT LINE
The tag must be either :USERIDS or :GROUPS

SYNTAX ERROR IN FILE - NAME NOT IN CORRECT COLUMN ON LINE
MVS names start in column 1, alias names in 10.

SYNTAX ERROR IN THE MVS USERID ON LINE
The MVS USERID must follow standard MVS naming.

SYNTAX ERROR IN THE MVS GROUPNAME ON LINE
The MVS groupname must follow standard MVS naming.

SYNTAX ERROR IN THE ALIAS USERID ON LINE
The alias USERID must be XPG compliant.

SYNTAX ERROR IN THE ALIAS GROUPNAME ON LINE
The alias groupname must be XPG compliant.

line-number
The line number in the useridaliastable file where the error occurred.

THE PREVIOUS ALIAS TABLE WILL CONTINUE TO BE USED

NO ALIAS TABLE IS IN USE AT THIS TIME.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRUAT

System Action: The contents of the old table are used. If there was no table previously, no table is used.

Operator Response: Contact the system programmer.

System Programmer Response: Correct the error in the alias file and then issue the SETOMVS USERIDALIASTABLE to start using the corrected alias file.

BPXM032E ERROR PROCESSING THE USERIDALIASTABLE - *text*

Explanation: An internal error occurred during userid/group name alias conversion processing.

In the message text:

USERID ALIAS PROCESSING IS TURNED OFF.

USERID ALIAS PROCESSING IS SUSPENDED UNTIL THE NEXT IPL.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRUAU

System Action: If there was an unrecoverable error, alias processing is set off and can not be used again until the next IPL. Otherwise, alias processing is set off and will not be used again until a SETOMVS USERIDALIASTABLE or SET OMVS= command is issued.

Operator Response: Contact the system programmer.

System Programmer Response: For unrecoverable errors, contact the IBM support team. For recoverable errors, reissue the SETOMVS or SET OMVS= command for the alias file.

BPXM033I USERIDALIASTABLE NAME CHANGE FOR - *aliasfile* **CANNOT BE PROCESSED AT THIS TIME. TRY AGAIN LATER.**

Explanation: A command was issued to change the alias file name while processing of a prior command to change the name is still in progress.

In the message text:

aliasfile
The USERIDALIASTABLE file name (up to the first 44 characters).

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOTASK

System Action: The new command is ignored.

Operator Response: Keep issuing the command until it is accepted.

System Programmer Response: None

BPXM036I BPXAS INITIATORS SHUTDOWN.

Explanation: The command was processed.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: The system has completed the requested action.

Operator Response: None.

System Programmer Response: None.

BPXM037I BPXAS INITIATORS SHUTDOWN DELAYED.

Explanation: Active initiators prevented complete shutdown.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: Shutdown will continue as the initiators complete.

Operator Response: Verify the shutdown sequence.

System Programmer Response: None.

BPXM038I MODIFY BPXOINIT SHUTDOWN COMMAND REJECTED.

Explanation: The modify command contained an unsupported operand.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: The command is ignored.

Operator Response: Correct the command.

System Programmer Response: None.

BPXM039I MODIFY BPXOINIT RESTART COMMAND REJECTED.

Explanation: The modify command contained an unsupported operand.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: Command is ignored.

Operator Response: Correct the command.

System Programmer Response: None.

BPXM040I FORK SERVICE ALREADY SHUTDOWN.

Explanation: This message is in response to a MODIFY BPXOINIT,SHUTDOWN = FORKS system command and indicates that the SHUTDOWN has already been performed.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: If required, issue MODIFY BPXOINIT,RESTART = FORKS to restart fork().

System Programmer Response: None.

BPXM041I FORK SERVICE ALREADY STARTED.

Explanation: This message is in response to a MODIFY BPXOINIT,RESTART = FORKS system command and indicates that the RESTART has already been performed.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: If required, issue MODIFY BPXOINIT,SHUTDOWN = FORKS to shutdown fork() service.

System Programmer Response: None.

BPXM042I FORK SERVICE RESTARTED.

Explanation: This message is in response to a MODIFY BPXOINIT,RESTART = FORKS system command and indicates that the RESTART has been performed.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: None.

Operator Response: None.

System Programmer Response: None.

BPXM043I ERROR WITH BPXAS INITIATOR SHUTDOWN REQUEST.

Explanation: This message is in response to the MODIFY BPXOINIT,RESTART = FORKS system command and indicates that the fork initiators have not been able to close immediately.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMRCCS

System Action: Initiators will eventually time out and close down on their own.

Operator Response: None.

System Programmer Response: None.

BPXM047I BPXBATCH FAILED BECAUSE SPAWN (BPX1SPN) OF *program_name* **FAILED WITH RETURN CODE** *return_code* **REASON CODE** *reason_code***.**

Explanation: BPXBATCH encountered an error when trying to issue a spawn (BPX1SPN) callable service to the program name specified. An incorrect program name may have been specified.

In the message text:

program_name
Up to the last 128 characters of the failed program name.

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMBATC

System Action: The system ends the program.

Operator Response: None.

Application Programmer Response: Look up the return code and reason code to determine why the BPX1SPN callable service (SPAWN) failed. Verify the program name exists in the path specified.

System Programmer Response: None.

BPXO001I *hh.mm.ss* **DISPLAY OMVS**

Explanation: The following material is part of the message text:

procname *status* *parmmembername*

USER **JOBNAME** **ASID** **PID** **PPID** **STATE** **START** **CT_SECS**
user *jobname* *asid* *pid* *ppid* *state* *shhmmss* *ct_secs*

[LATCHWAITPID=*latchwaitpid* **CMD=***command***]**

[SERVER=*servername* **AF=***activefiles* **MF=***maxfiles* **TYPE=***servertype***]**

In response to a DISPLAY OMVS,ASID=, DISPLAY OMVS,U=, or DISPLAY OMVS,VSERVER operator command, this message displays information about the state of OS/390 UNIX and its processes. The line beginning with user appears one or more times for each process.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the OS/390 UNIX cataloged procedure.

status
One of the following:

ACTIVE
OS/390 UNIX is currently active.

NOT STARTED
OS/390 UNIX was not started.

INITIALIZING
OS/390 UNIX is initializing.

TERMINATING
OS/390 UNIX is terminating.

TERMINATED
OS/390 UNIX has terminated.

ETC/INIT WAIT
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

parmmembername
The parmlib member name specified on START OMVS.

user
The user ID of the process.

jobname
The job name of the process.

asid
The address space ID for the process or zero when states are Z or L.

pid The process ID, in decimal, of the process.

ppid
The parent process ID, in decimal, of the process.

state
The state of the process or of the most recently created thread in the process as follows:

1 Process state is for a single thread process

A Message queue receive wait

B Message queue send wait

C Communication system kernel wait

D Semaphore operation wait

E Quiesce frozen

F File system kernel wait

G MVS Pause wait

H Process state is for multiple threads and pthread_create was used to create one of the threads. Process state is obtained from the Initial Pthread created Task (IPT).

I Swapped out

K Other kernel wait (for example, pause or sigsuspend)

L Canceled, parent has performed wait, and still session or process group leader

M Process state is for multiple threads and pthread_create was **not** used to create any of the multiple threads. Process state is obtained from the most recently created thread.

P Ptrace kernel wait

Q Quiesce termination wait

R Running (not kernel wait)

S Sleeping

T Stopped

W Waiting for child (wait or waitpid callable service)

X Creating new process (fork callable service is running)

Z Canceled and parent has **not** performed wait (Z for zombie)

shhmmss
The time, in hours, minutes, and seconds, when the process was started.

ct_secs
The total execution time for the process in seconds in the format ssssss.hhh. The value displayed is an approximate value, which may be less than a previously displayed value. When this value exceeds 11.5 days of execution time this field will overflow. When an overflow occurs the field is displayed as ******.***

latchwaitpid
Either zero or the latch process ID, in decimal, for which this process is waiting.

command
The command that created the process truncated to 40 characters. It can be converted to uppercase using the CAPS option.

servername
The name of the server process. It can be converted to uppercase using the CAPS option.

activefiles
The number of active server file tokens.

maxfiles
The maximum number of active server file tokens allowed.

servertype
One of the following:

FILE
A network file server

LOCK
A network lock server

FEXP
A network file exporter

SFDS
A shared file server

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOMAST

System Action: The system continues processing.

Operator Response: None.

System Programmer Response: None.

BPXO002I *hh.mm.ss* **DISPLAY OMVS**

Explanation: The following material is part of the message text:

```
procname      status                                        parmmembername

TYPENAME      DEVICE     ----------STATUS----------  QJOBNAME     QPID
type          device     filestatus                  qjobname     qpid

              NAME=filesysname
              PATH=pathname
              MOUNT PARM=mountparm
```

In response to a DISPLAY OMVS,FILE command, this message displays information about OS/390 UNIX and its file systems. The line beginning with type appears one or more times for each file system.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the OS/390 UNIX cataloged procedure.

status
One of the following:

ACTIVE
OS/390 UNIX is currently active.

NOT STARTED
OS/390 UNIX was not started.

INITIALIZING
OS/390 UNIX is initializing.

TERMINATING
OS/390 UNIX is terminating.

TERMINATED
OS/390 UNIX has terminated.

ETC/INIT WAIT
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

parmmembername
The parmlib member name specified on the START OMVS command.

type
File system type as defined by the FILESYSTYPE statement.

device
The device value to uniquely identify the device.

filestatus
One of the following:

FORCE UNMOUNT
An unmount with force is in progress.

DRAIN UNMOUNT
A file system drain unmount is in progress.

IMMEDIATE UNMOUNT
An immediate unmount is in progress.

NORMAL UNMOUNT
A normal unmount is in progress.

RESET UNMOUNT
An unmount was reset.

IMMEDIATE UNMOUNT ATTEMPTED
An immediate unmount was attempted

ACTIVE
File system is active.

QUIESCED
File system is quiesced.

NOT ACTIVE
File system is not active.

MOUNT IN PROGRESS
File system is being mounted.

ASYNCH MOUNT IN PROGRESS
File system is being mounted asynchronously.

qjobname
The jobname that quiesced the file system.

qpid
The process ID that quiesced the file system.

filesysname
The name of the file system.

pathname
The name of the directory where the file system is mounted truncated to 60 characters. You can convert it to uppercase by using the CAPS option.

mountparm
The parameter specified to the mount callable service, truncated to 57 characters. You can convert it to uppercase by using the CAPS option.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOMAST

System Action: The system continues processing.

Operator Response: None.

System Programmer Response: None.

BPXO003I *hh.mm.ss* **DISPLAY OMVS**

Explanation: The following material is part of the message text:

procname *status* *parmmembername*

[*valuespecified* **NOT FOUND]**

In response to a DISPLAY OMVS operator command. Also for DISPLAY OMVS,ASID=, DISPLAY OMVS,U=, or DISPLAY OMVS,VSERVER operator command when the process specified could not be found.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the member in SYS1.PROCLIB used to start OS/390 UNIX.

status
One of the following:

ACTIVE
OS/390 UNIX is currently active.

NOT STARTED
OS/390 UNIX was not started.

INITIALIZING
OS/390 UNIX is initializing.

TERMINATING
OS/390 UNIX is terminating.

TERMINATED
OS/390 UNIX has terminated.

ETC/INIT WAIT
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

parmmembername
The parmlib member name specified on START OMVS.

valuespecified
The ASID= or U= value specified on DISPLAY OMVS.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOMAST

System Action: The system continues processing.

Operator Response: None.

System Programmer Response: None.

BPXO006I ERROR IN SETOMVS COMMAND. THE *bad-parameter* **PARAMETER VALUE IS OUT OF THE ALLOWED RANGE OF** *minimum-number* **TO** *maximum-number***.**

Explanation: A SETOMVS command parameter value is out of range.

In the message text:

bad-parameter
Parameter that is out of range.

minimum-number
The low value of the allowed range.

maximum-number
The high value of the allowed range.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system ignores the parameter out of range, keeps the current value and continues to process the rest of the SETOMVS command.

Operator Response: Issue a SETOMVS command with this parameter in range.

System Programmer Response: None.

BPXO007I ERROR IN SETOMVS COMMAND. *bad-parameter* **PARAMETER VALUE IS NOT NUMERIC.**

Explanation: A SETOMVS command parameter should have been a number.

In the message text:

bad-parameter
Parameter that is not numeric.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: The system ignores the parameter in error, keeps the current value and continues to process the rest of the SETOMVS command.

Operator Response: Issue a SETOMVS command with this parameter corrected.

System Programmer Response: None.

BPXO008I ERROR IN SETOMVS COMMAND. THE NUMBER OF VALUES SPECIFIED FOR THE PARAMETER *badparm* **EXCEEDS THE MAXIMUM NUMBER ALLOWED.**

Explanation: The system encountered an error in a SETOMVS command.

In the message text:

badparm
The parameter that has too many values.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMY1

System Action: The system ignores the extra values specified and continues to process the rest of the command.

Operator Response: Issue the SETOMVS command with fewer values.

System Programmer Response: None.

BPXO009I ERROR IN SETOMVS COMMAND. THE LENGTH OF THE PARAMETER *badparm* **IS NOT IN THE ALLOWED RANGE OF** *minimum-number* **TO** *maximum-number***.**

Explanation: The system encountered an error in a SETOMVS command. The parameter is either too small, too long or null.

In the message text:

badparm
The parameter with the bad length.

minimum-number
The low value of the allowed range.

maximum-number
The high value of the allowed range.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMZ1

System Action: The system ignores this parameter and continues to process the rest of the command.

Operator Response: Reissue the SETOMVS command after correcting this parameter.

System Programmer Response: None.

BPXO012I ERRORS OCCURRED IN THE PROCESSING OF THE SETOMVS COMMAND; NO VALUES WERE SET.

Explanation: The system encountered one or more errors processing the SETOMVS command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOTASK

System Action: No SETOMVS parameters were set.

Operator Response: Reissue the SETOMVS command correcting the problems.

System Programmer Response: None.

BPXO015I THE SETOMVS COMMAND WAS SUCCESSFUL.

Explanation: The SETOMVS command was successful.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOTASK

System Action: SETOMVS parameters were set.

Operator Response: None.

System Programmer Response: None.

BPXO016I (*form 1***) SETOMVS SYNTAX ERROR;** *badparm* **WAS FOUND WHERE ONE OF THE FOLLOWING WAS EXPECTED:** *parms*
BPXO016I (*form 2***) SETOMVS SYNTAX ERROR;** *badparm* **WAS NOT EXPECTED**

Explanation: In form 1 of the message, the system found an invalid parameter value in a SETOMVS command. In form 2 of the message, the system found an unexpected parameter in a SETOMVS command.

In the message text:

badparm
The unexpected parameter, or the invalid parameter value.

parms
Up to ten of the expected parameters.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMX1

System Action: None.

Operator Response: Reissue the SETOMVS command with the desired parameter or the valid parameter value.

System Programmer Response: None.

BPXO024I ERROR IN SETOMVS COMMAND. THE *badparm* **PARAMETER VALUE MUST BEGIN WITH AN ALPHABETIC CHARACTER.**

Explanation: The system encountered an error in a SETOMVS command.

In the message text:

badparm
The parameter that has an incorrect first character.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMY1

System Action: The system ignores this parameter and continues to process the rest of the command.

Operator Response: Issue the SETOMVS command with this parameter corrected.

System Programmer Response: None.

BPXO025I ERROR IN SETOMVS COMMAND. *expected* **WAS EXPECTED BEFORE** *token***.**

Explanation: The system encountered an error in a SETOMVS command.

In the message text:

expected
The parameter that was expected.

token
The parameter that was in error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMY1

System Action: The system ignores this parameter and continues to process the rest of the command.

Operator Response: Issue the SETOMVS command with this parameter corrected.

System Programmer Response: None.

BPXO026I SETOMVS COMMAND FAILED. ISSUER DOES NOT HAVE MASTER CONSOLE AUTHORITY.

Explanation: The issuer of the SETOMVS command does not have Master Console Authority.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOSETO

System Action: No SETOMVS parameters were set.

Operator Response: Reissue the SETOMVS command from the master console.

System Programmer Response: None.

BPXO027I SETOMVS COMMAND PROCESSOR IS CURRENTLY NOT AVAILABLE. REASON CODE: *reason_code*

Explanation: The SETOMVS command processor had an unrecoverable error. No SETOMVS commands can be processed.

1. The SETOMVS initialization routine BPXOSETO could not establish addressability to the general recovery routine BPXMIPCE.
2. The SETOMVS initialization routine BPXOSETO could not establish ESTAE recovery via BPXMIPCE.
3. The SETOMVS processing routine BPXOTASK is currently not processing commands.
4. OMVS is not up at this time.
5. OMVS is not completely inititalized.

In the message text:

reason_code
Explains why the SETOMVS command processor is not available.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOSETO

System Action: The SETOMVS command is not processed.

Operator Response: Contact the system programmer.

System Programmer Response: Try the command later, the processor will probably re-establish itself.

BPXO028I SET OMVS COMMAND PROCESSOR IS CURRENTLY NOT AVAILABLE. REASON CODE: *reason_code*

Explanation: The SET OMVS command processor had an unrecoverable error. No SET OMVS commands can be processed.

1. The SET OMVS initialization routine BPXOSETX could not establish addressability to the general recovery routine BPXMIPCE.
2. The SET OMVS initialization routine BPXOSETX could not establish ESTAE recovery via BPXMIPCE.
3. The SET OMVS processing routine BPXOTASK is currently not processing commands.

In the message text:

reason_code
Explains why the SET OMVS command processor is not available. The reason codes are explained in *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOSETX

System Action: The SET OMVS command is not processed.

Operator Response: Contact the system programmer.

System Programmer Response: Try the command later, the processor will probably re-establish itself.

BPXO030I SYNTAX ERRORS ENCOUNTERED WHILE PROCESSING PARMLIB MEMBERS ON SET OMVS COMMAND. REASON: *reason_code*

Explanation: Syntax errors were found in the parmlib member(s) specified on the SET OMVS command. The correct format is xx, (xx), or (xx,yy,...).

In the message text:

reason_code
Explains why the SET OMVS command was not executed. The reason codes are explained in *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOTASK

System Action: The SET OMVS command is not processed.

Operator Response: Enter valid parmlib member suffix(es) on SET OMVS=.

System Programmer Response: None.

BPXO031I ERRORS IN PARMLIB MEMBER=*memname* **REFER TO THE HARD COPY LOG. SET OMVS COMMAND FAILED.**

Explanation: The system encountered errors in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINPRM

System Action: The system wrote the error messages to the hard copy log. Error checking for other parmlib members continues.

Operator Response: None.

System Programmer Response: Look in hard copy log at the previous messages explaining the errors in the parmlib member. Correct the errors in the parmlib member before using it again.

BPXO032I THE SET OMVS COMMAND WAS SUCCESSFUL.

Explanation: The SET OMVS command was successful.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINPRM

System Action: The SET OMVS parmlib members values were set.

Operator Response: None.

System Programmer Response: None.

BPXO033I IEFPARM DD COULD NOT BE ALLOCATED. NO MEMBERS CAN BE PROCESSED. RETURN CODE = *returncode* **REASON CODE =** *reason_code*

Explanation: The system encountered an error attempting to allocate the IEFPARM DD which is used to read members from SYS1.PARMLIB.

In the message text:

returncode
The return code from attempting to allocate the IEFPARM DD.

reason_code
The reason code from attempting to allocate the IEFPARM DD.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINPRM

System Action: The SET OMVS command is not processed.

Operator Response: Contact the system programmer.

System Programmer Response: Use the return code and reason code to refer to the IEFPRMLB macro, documented in *OS/390 MVS Programming: Authorized Assembler Services Reference ENF-IXG*.

BPXO034I SYNTAX ERRORS ENCOUNTERED WHILE PROCESSING PARMLIB MEMBER NAME ON SETOMVS COMMAND. FORMAT IS SETOMVS RESET = (XX)

Explanation: Syntax errors were found in the Parmlib member specification on the SETOMVS RESET command. The parmlib suffix was incorrectly specified. The correct format is (xx).

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXIPMZ1

System Action: The SETOMVS command is not processed.

Operator Response: Enter a valid parmlib member suffix on SETOMVS RESET = (xx). Only one parmlib member may be specified at a time.

System Programmer Response: None.

BPXO035I ERRORS IN PARMLIB MEMBER = *memname***. REFER TO THE HARD COPY LOG. SETOMVS RESET COMMAND FAILED.**

Explanation: The system encountered errors in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXINPRM

System Action: The system wrote the error message to the hard copy log.

Operator Response: None.

System Programmer Response: Look in the hard copy log at the previous messages explaining the errors in the parmlib member. Correct the errors in the parmlib member before using it again.

BPXO036I PARMLIB OPTIONS IGNORED WHILE PROCESSING PARMLIB MEMBER = *memname settype***.**

Explanation: Not all parmlib commands are accepted by the various parmlib processing operations. This is usually not an error. Consult the documentation for additional details.

In the message text:

memname
The name of the parmlib member containing the ignored commands.

settype
One of the following:

SETOMVS RESET = IGNORES CTRACE MOUNT ROOT RUNOPTS.
Parmlib options ignored by the SETOMVS RESET = command.

SET OMVS = IGNORES CTRACE FILESYSTYPE MOUNT NETWORK RUNOPTS SUBFILESYSTYPE.
Parmlib options ignored by the SET OMVS command.

UNKNOWN PARMLIB OPTIONS IGNORED DURING INITIALIZATION..
Parmlib options have been ignored during initialization.

[SERVER=*servername* **AF=***activefiles* **MF=***maxfiles* **TYPE=***servertype***]**

[THREAD_ID TCB@ PRI_JOB USERNAME ACC_TIME SC STATE]
[*threadid tcbaddr prijob username ac_secs sc thdstate***]**

[TAG=*tagdata***]**

In response to a DISPLAY OMVS,ASID=, DISPLAY OMVS,U=, DISPLAY OMVS,VSERVER or DISPLAY OMVS,PID= operator command, this message displays information about the state of OS/390 UNIX and its processes. The line beginning with user appears one or more times for each process.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the OS/390 UNIX cataloged procedure.

kernelasid
The address space id of the Kernel.

status
One of the following:

ACTIVE
OS/390 UNIX is currently active.

NOT STARTED
OS/390 UNIX was not started.

INITIALIZING
OS/390 UNIX is initializing.

TERMINATING
OS/390 UNIX is terminating.

TERMINATED
OS/390 UNIX has terminated.

ETC/INIT WAIT
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

FORK SHUTDOWN
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

user
The user ID of the process.

jobname
The job name of the process.

asid
The address space ID for the process or zero when states are Z or L.

pid The process ID, in decimal, of the process.

ppid
The parent process ID, in decimal, of the process.

state
The state of the process or of the most recently created thread in the process as follows:

1 Process state is for a single thread process

A Message queue receive wait

B Message queue send wait

C Communication system kernel wait

D Semaphore operation wait

E Quiesce frozen

F File system kernel wait

G MVS Pause wait

H Process state is for multiple threads and pthread_create was used to create one of the threads. Process state is obtained from the Initial Pthread created Task (IPT).

I Swapped out

K Other kernel wait (for example, pause or sigsuspend)

L Canceled, parent has performed wait, and still session or process group leader

M Process state is for multiple threads and pthread_create was **not** used to create any of the multiple threads. Process state is obtained from the most recently created thread.

P Ptrace kernel wait

Q Quiesce termination wait

R Running (not kernel wait)

S Sleeping

T Stopped

W Waiting for child (wait or waitpid callable service)

X Creating new process (fork callable service is running)

Z Canceled and parent has **not** performed wait (Z for zombie)

shhmmss
The time, in hours, minutes, and seconds, when the process was started.

ct_secs
The total execution time for the process in seconds in the format ssssss.hhh. The value displayed is an approximate value, which may be less than a previously displayed value. When this value exceeds 11.5 days of execution time this field will overflow. When an overflow occurs the field is displayed as ******.***

latchwaitpid
Either zero or the latch process ID, in decimal, for which this process is waiting.

command
The command that created the process truncated to 40 characters. You can convert it to uppercase by using the CAPS option.

servername
The name of the server process. You can convert it to uppercase by using the CAPS option.

activefiles
The number of active server file tokens.

maxfiles
The maximum number of active server file tokens allowed.

servertype
One of the following:

FILE
A network file server

LOCK
A network lock server

FEXP
A network file exporter

SFDS
A shared file server

threadid
The thread ID, in hexadecimal, of the thread.

tcbaddr
The address of the TCB that represents the thread.

prijob
The job name from the current primary address space if different from the home address space, otherwise blank. This is only accurate if the thread is in a wait, otherwise it is from the last time that status '.'was saved. When the data is not available the field will be displayed as ********.

username
The username of the thread if a task level security environment created by pthread_security_np exists, otherwise blank. When the data is not available the field will be displayed as ********.

ac_secs
The accumulated TCB time in seconds in the format ssssss.hhh. When this value exceeds 11.5 days of execution time this field will overflow. When an overflow occurs the field is displayed as ******.***. When the data is not available the field will be displayed as **********.

sc The current or last syscall request.

thdstate
The state of the thread as follows:

A	Message queue receive wait
B	Message queue send wait
C	Communication system kernel wait
D	Semaphore operation wait
E	Quiesce frozen
F	File system kernel wait
G	MVS Pause wait
K	Other kernel wait (for example, pause or sigsuspend)
J	The thread was pthread created rather than dubbed
N	The thread is medium weight
O	The thread is asynchronous and medium weight
P	Ptrace kernel wait
Q	Quiesce termination wait
R	Running (not kernel wait)
S	Sleeping
U	Initial process thread (heavy weight and synchronous)
V	Thread is detached
W	Waiting for child (wait or waitpid callable service)
X	Creating new process (fork callable service is running)
Y	Thread is in an MVS wait

tagdata
The tag data associated with the thread, if present. From 1 to 65 EBCDIC characters

BPXO041I *hh.mm.ss* **DISPLAY OMVS**

Explanation: The following material is part of the message text:

procname *kernelasid* *status* *parmmemberlist*

TYPENAME **DEVICE** **----------STATUS----------** **QJOBNAME** **QPID**
type *device* *filestatus* *qjobname* *qpid*

NAME=*filesysname*
PATH=*pathname*
MOUNT PARM=*mountparm*

In response to a DISPLAY OMVS,FILE command, this message displays information about OS/390 UNIX and its file systems. The line beginning with type appears one or more times for each file system.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the OS/390 UNIX cataloged procedure.

kernelasid
The address space id of the Kernel.

status
One of the following:

ACTIVE
OS/390 UNIX is currently active.

NOT STARTED
OS/390 UNIX was not started.

INITIALIZING
OS/390 UNIX is initializing.

TERMINATING
OOS/390 UNIX is terminating.

TERMINATED
OS/390 UNIX has terminated.

ETC/INIT WAIT
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

type
The file system type as defined by the FILESYSTYPE statement.

device
The device value to uniquely identify the device.

filestatus
One of the following:

FORCE UNMOUNT
An unmount with force is in progress.

DRAIN UNMOUNT
A file system drain unmount is in progress.

IMMEDIATE UNMOUNT
An immediate unmount is in progress.

NORMAL UNMOUNT
A normal unmount is in progress.

RESET UNMOUNT
An unmount was reset.

IMMEDIATE UNMOUNT ATTEMPTED
An immediate unmount was attempted

ACTIVE
File system is active.

QUIESCED
File system is quiesced.

NOT ACTIVE
File system is not active.

MOUNT IN PROGRESS
File system is being mounted.

ASYNCH MOUNT IN PROGRESS
File system is being mounted asynchronously.

qjobname
The jobname that quiesced the file system.

qpid
The process ID that quiesced the file system.

filesysname
The name of the file system.

pathname
The name of the directory where the file system is mounted truncated to 60 characters. You can convert it to uppercase by using the CAPS option.

mountparm
The parameter specified to the mount callable service, truncated to 57 characters. You can convert it to uppercase by using the CAPS option.

BPXO042I *hh.mm.ss* **DISPLAY OMVS**

Explanation: The following material is part of the message text:

procname *kernelasid* *status* *parmmemberlist*

[*valuespecified* **NOT FOUND]**

This message is displayed in response to a DISPLAY OMVS operator command where process data was not able to be collected. This message is also displayed for DISPLAY OMVS,ASID=, DISPLAY OMVS,U=, DISPLAY OMVS,VSERVER or DISPLAY OMVS,PID= operator command when the process specified could not be found.

In the message text:

hh.mm.ss
The time in hours (00—23), minutes (00—59), and seconds (00—59) for the DISPLAY OMVS command.

procname
The name of the member in SYS1.PROCLIB used to start OS/390 UNIX.

kernelasid
The address space id of the Kernel.

status
One of the following:

ACTIVE
OS/390 UNIX is currently active.

NOT STARTED
OS/390 UNIX was not started.

INITIALIZING
OS/390 UNIX is initializing.

TERMINATING
OS/390 UNIX is terminating.

TERMINATED
OS/390 UNIX has terminated.

ETC/INIT WAIT
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

FORK SHUTDOWN
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

valuespecified
The ASID=, U= or PID= value specified on DISPLAY OMVS.

In response to a DISPLAY OMVS,OPTIONS operator command, this message displays current values of all parmlib options that are able to be set using the SET OMVS or SETOMVS commands.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the member in SYS1.PROCLIB used to start OS/390 UNIX.

kernelasid
The address space id of the Kernel.

status
One of the following:

ACTIVE
OS/390 UNIX is currently active.

NOT STARTED
OS/390 UNIX was not started.

INITIALIZING
OS/390 UNIX is initializing.

TERMINATING
OS/390 UNIX is terminating.

TERMINATED
OS/390 UNIX has terminated.

ETC/INIT WAIT
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

FORK SHUTDOWN
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

maxprocsys
Maximum processes on the system.

maxprocuser
Maximum processes per User ID.

maxfileproc
Maximum number of allocated files for a single process.

maxfilesize
Maximum file size.

maxcputime
Maximum CPU time.

maxuids
Maximum number of users on the system.

maxrtys
Maximum number of remote-terminal sessions.

maxptys
Maximum number of pseudo-terminal sessions.

maxmmaparea
Maximum size of Memory Map Area in PAGES.

maxassize
Maximum address space size.

maxthreads
Maximum number of Threads.

maxthreadstasks
Maximum number of tasks running Pthreads per process.

maxcoresize
Maximum core size.

maxsharepages
Maximum number of pages that can be in a shared relationship in the system.

ipcmsgqbytes
Maximum bytes per message queue.

ipcmsgqmnum
Maximum messages per queue.

ipcmsgnids
Maximum system queue IDs.

ipcsemnids
Maximum system semaphore IDs.

ipcsemnops
Maximum number of operations per BPX1SOP (SEMOP) call.

ipcsemnsems
Maximum number of semaphores per semaphore set.

ipcshmmpages
Maximum system shared memory pages for all segments.

ipcshmnids
Maximum system shared memory IDs.

ipcshmnsegs
Maximum shared memory segments per process.

ipcshmmspages
Maximum system shared memory pages for all segments.

superuser
Userid of the Super User.

forkcopy
One of the following:

COPY
ForkCopy = ON will copy parent data to child at the time of the fork.

COW
ForkCopy = OFF will use Copy-on-Write for the parent data (Default).

stepliblist
Name of STEPLIB dataset, truncated to 50 characters.

useridalias
Name of Userid table, truncated to 50 characters.

priorpgstatus
One of the following:

NONE
PRIORITYPG values are not currently set.

PROPAGATED
The last PRIORITYPG value was propagated.

prioritypg
Performance group numbers for compatibility mode.

priorgoalstatus
One of the following:

NONE
PRIORITYGOAL values are set.

PROPAGATED
The last PRIORITYGOAL value was propagated.

noargs
Argument supression list.

prioritygoal
Service classes for goal mode.

syscallcount
One of the following:

YES
syscallcount = YES indicates tracing of syscall information is being done.

NO
syscallcount = NO indicates tracing for this is turned off.

ttygroup
Group name for terminals.

maxqueuedsigs
Maximum queued signals.

System Programmer Response: None.

BPXO044I *hh.mm.ss* **DISPLAY OMVS**

Explanation: The following material is part of the message text:

procname *kernelasid* *status* *parmmemberlist*

TYPENAME **DEVICE** **----------STATUS----------** **MODE** **QJOBNAME** **QPID**
type *device* *filestatus* *filemode* *qjobname* *qpid*

NAME=*filesysname*
PATH=*pathname*
MOUNT PARM=*mountparm*

In response to a DISPLAY OMVS,FILE command, this message displays information about OS/390 UNIX and its file systems. The line beginning with type appears one or more times for each file system.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the OS/390 UNIX cataloged procedure.

kernelasid
The address space id of the Kernel.

status
One of the following:

ACTIVE
OS/390 UNIX is currently active.

NOT STARTED
OS/390 UNIX was not started.

INITIALIZING
OS/390 UNIX is initializing.

TERMINATING
OS/390 UNIX is terminating.

TERMINATED
OS/390 UNIX has terminated.

ETC/INIT WAIT
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

FORK SHUTDOWN
OS/390 UNIX is waiting for the **/etc/init** or **/usr/sbin/init** program to complete initialization.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

type
The file system type as defined by the FILESYSTYPE statement.

device
The device value to uniquely identify the device.

filestatus
One of the following:

FORCE UNMOUNT
An unmount with force is in progress.

DRAIN UNMOUNT
A file system drain unmount is in progress.

IMMEDIATE UNMOUNT
An immediate unmount is in progress.

NORMAL UNMOUNT
A normal unmount is in progress.

RESET UNMOUNT
An unmount was reset.

IMMEDIATE UNMOUNT ATTEMPTED
An immediate unmount was attempted

ACTIVE
File system is active.

QUIESCED
File system is quiesced.

NOT ACTIVE
File system is not active.

MOUNT IN PROGRESS
File system is being mounted.

ASYNCH MOUNT IN PROGRESS
File system is being mounted asynchronously.

filemode
One of the following:

RDWR
The filesystem is mounted for read/write access.

READ
The filesystem is mounted for read only access.

qjobname
The jobname that quiesced the file system.

qpid
The process ID that quiesced the file system.

filesysname
The name of the file system.

pathname
The name of the directory where the file system is mounted truncated to 60 characters. You can convert it to uppercase by using the CAPS option.

mountparm
The parameter specified to the mount callable service, truncated to 57 characters. You can convert it to uppercase by using the CAPS option.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXOMAST

System Action: The system continues processing.

Operator Response: None.

System Programmer Response: None.

BPXP001I OPENMVS INIT PROCESS CANNOT BE CREATED. FAILURE REASON CODE = *reason_code***. APPC/MVS RETURN CODE =** *return_code***.**

Explanation: The system encountered an error while creating the first OS/390 UNIX process, which is the INIT process.

In the message text:

reason_code
The failure reason code from OS/390 UNIX.

return_code
The return code from APPC/MVS. The APPC/MVS return code may be 0 if the failure is not related to APPC. See *OS/390 MVS Programming: Writing TPs for APPC/MVS* for information on the return code.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPRFC, BPXPRFK

System Action: The system ends the OS/390 UNIX initialization.

Operator Response: None.

System Programmer Response: Examine the failure reason code and APPC/MVS return code. If the failure is related to APPC/MVS, verify that APPC/MVS and the APPC/MVS scheduler are operating. Correct the problem before restartingOS/390 UNIX.

BPXP003E OPENMVS INIT PROCESS CANNOT BE STARTED. AN ERROR OCCURRED DURING APPC PROCESSING. APPC RETURN CODE = *returncode***. VERIFY APPC AND APPC SCHEDULER ARE OPERATIVE, OR ENTER FORCE** *jobname***,ARM TO END PROCESSING.**

Explanation: An error was reported by APPC/MVS during initialization of OS/390 UNIX. The error may be caused by one or more of the following reasons:

1. APPC/MVS is not operating.
2. The APPC/MVS scheduler is not operating.
3. The APPC/MVS scheduler is malfunctioning.
4. APPC/MVS configuration work was not done correctly when OS/390 UNIX was installed. The ASCHPMxx members may not have been updated to define the APPC/MVS scheduler class name used for OS/390 UNIX, or the APPC/MVS scheduler may have been started with an incorrect member that does not have the class name.

In the message text:

returncode
The error return code from APPC/MVS. *OS/390 MVS Programming: Writing TPs for APPC/MVS* provides more details on the APPC/MVS return code.

jobname
The name of the job by which OS/390 UNIX will be terminated with the FORCE ARM command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPRFK

System Action: The system waits for the APPC/MVS error condition to be corrected, or until the operator issues the FORCE ARM command to terminate the START OS/390 UNIX request.

Operator Response: Issue the FORCE ARM command to terminate theOS/390 UNIX START request, if necessary.

System Programmer Response: Verify that APPC/MVS is operating by issuing a DISPLAY APPC command. Verify that the APPC/MVS scheduler is operating by issuing a DISPLAY ASCH command. If the scheduler is operating, verify that it has been started correctly with the proper member name.

If this is the first time you are initializing OS/390 UNIX, verify that the ASCHPMxx member has been updated to define the APPC/MVS scheduler class name used for OS/390 UNIX.

If the problem cannot be resolved quickly, end the initialization by asking the operator to issue the FORCE ARM command against OS/390 UNIX. Ask the operator to start OS/390 UNIX after the problem is resolved.

BPXP004E FORK PROCESSING FAILED. AN ERROR OCCURRED DURING APPC PROCESSING. APPC RETURN CODE = *returncode***. VERIFY THAT APPC AND APPC SCHEDULER ARE OPERATIVE.**

Explanation: APPC/MVS reported an error during fork processing. The error may be caused by one or more of the following reasons:

1. APPC/MVS is not operating.
2. The APPC/MVS scheduler is not operating.
3. The APPC/MVS scheduler is malfunctioning.
4. APPC/MVS configuration work was not done correctly when OS/390 UNIX was installed. The ASCHPMxx members may not have been updated to define the APPC/MVS scheduler class name used for OS/390 UNIX, or the APPC/MVS scheduler may have been started with an incorrect member that does not have the class name.

In the message text:

returncode
The error return code from APPC/MVS. *OS/390 MVS Programming: Writing TPs for APPC/MVS* provides more details on the APPC/MVS return code.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPRFK

System Action: The system requires APPC/MVS to be functioning in order to process fork requests.

Operator Response: Contact the system programmer.

System Programmer Response: Verify that APPC/MVS is operating by issuing a DISPLAY APPC command. Verify that the APPC/MVS scheduler is operating by issuing a DISPLAY ASCH command. If the scheduler is operating, verify that it has been started correctly with the proper member name.

If this is the first time you are initializing OS/390 UNIX, verify that the ASCHPMxx member has been updated to define the APPC/MVS scheduler class name used for OS/390 UNIX.

BPXP005I A FORK OR SPAWN ERROR WAS ENCOUNTERED. RETURN CODE *return_code* **REASON CODE** *reason_code*

Explanation: The system encountered an error while performing the fork or the spawn.

In the message text:

return_code
The failure return code.

reason_code
The failure reason code. For an explanation of the return code and reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXPRFP, BPXPRSPN

System Action: The system ends the process.

Operator Response: Contact the system programmer.

System Programmer Response: Examine the return and reason code for the service that ended in error to determine the reason for the error.

BPXP006E *procname* **IS** *text*

Explanation: OS/390 UNIX initialization processing seems to be taking an excessive amount of time to complete. The message identifies the last initialization step to have been successfully started and therefore, the one most likely responsible for any delays or hangs.

In the message text:

procname
The name of the OS/390 UNIX cataloged procedure.

INITIALIZING THE FILE SYSTEM
Indicates that OS/390 UNIX initialization has started the initialization of the file system, but the file system initialization has not yet completed.

CREATING THE BPXOINIT ADDRESS SPACE
Indicates that OS/390 UNIX initialization has issued a system request to create the BPXOINIT address space, but the address space has not yet started.

PROCESSING IN BPXOINIT
Indicates that BPXOINIT has started processing but BPXOINIT has not yet started the initialization process (either the initialization REXX EXEC, /etc/init, or /usr/sbin/init).

STARTING THE INITIALIZATION PROCESS
Indicates that BPXOINIT is attempting to fork an address space in which to run the initialization process (either the initialization REXX EXEC, /etc/init, or /usr/sbin/init) but the fork has not yet completed.

RUNNING THE INITIALIZATION PROCESS
Indicates that BPXOINIT has started the initialization process (either the initialization REXX EXEC, /etc/init, or /usr/sbin/init) but the initialization process has not yet completed.

Some commands can cause hangs in the /etc/rc process, invoked from /etc/init, thus resulting in the issuance of this message. If the command,

set —v —x

has been added to /etc/rc (it is shipped in the sample /etc/rc), the system programmer may view /etc/log during a hang in /etc/rc by starting the shell from a superuser and issuing the command "cat /etc/log". Note that it must be a superuser; a user having permission to BPX.SUPERUSER is not enough. The last command listed in /etc/log is most likely the one causing the hang or delay.

WAITING FOR SECURITY PRODUCT INITIALIZATION
Indicates that OS/390 UNIX initialization is waiting for the security product to complete initialization.

WAITING FOR CATALOG ADDRESS SPACE INITIALIZATION
Indicates that OS/390 UNIX initialization is waiting for the catalog address space to complete initialization.

WAITING FOR JOB ENTRY SUBSYSTEM INITIALIZATION
Indicates that OS/390 UNIX initialization is waiting for the job entry subsystem (JES) to complete initialization.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMISDI

System Action: No action is taken. Initialization processing is allowed to continue.

Operator Response: If the condition persists, contact the system programmer.

System Programmer Response: Contact the IBM Support Center.

BPXP007E STARTING PHYSICAL FILE SYSTEM *pfsname***[IN ADDRESS SPACE]** *spacename*

Explanation: OS/390 UNIX file system initialization processing seems to be taking an excessive amount of time to complete. The message identifies the physical file system currently being processed.

In the message text:

pfsname
The name associated with the physical file system.

IN ADDRESS SPACE
spacename
The name of the address space processing the physical file system initialization, if it is other than the kernel. If it is the kernel, this field is blank.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMISDI

System Action: No action is taken. Initialization processing is allowed to continue.

Operator Response: If the condition persists, contact the system programmer.

System Programmer Response: Contact the IBM support center.

BPXP008E MOUNTING THE FILE SYSTEM *name*

Explanation: OS/390 UNIX file system initialization processing seems to be taking an excessive amount of time to complete. The message identifies the file system currently being mounted.

In the message text:

name
The file system name specified on the MOUNT or ROOT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXMISDI

System Action: No action is taken. Initialization processing is allowed to continue.

Operator Response: If the condition persists, contact the system programmer.

System Programmer Response: Contact the IBM support center.

BPXT001I THE MAXSOCKETS VALUE OF *max-sockets-val* **ON THE NETWORK STATEMENT IN PARMLIB MEMBER** *member-name* **EXCEEDS THE MAXIMUM NUMBER OF SOCKETS SUPPORTED BY THE** *text*

Explanation: During OS/390 UNIX initialization, the MAXSOCKETS value on the NETWORK statement exceeded the maximum number of sockets supported by the sockets physical file system.

In the message text:

max-sockets-val
The maximum sockets value specified on the NETWORK statement in the BPXPRMxx parmlib member.

member-name
The member name processed as a result of the START request.

maximum-sockets
The documented maximum number of sockets supported by the sockets physical file system.

UNIX DOMAIN SOCKETS FILE SYSTEM. A VALUE OF *maximum-sockets* **WILL BE USED FOR MAXSOCKETS.**

INET DOMAIN SOCKETS FILE SYSTEM. A VALUE OF *maximum-sockets* **WILL BE USED FOR MAXSOCKETS.**

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXTUNWK

System Action: The sockets physical file system uses the documented value for MAXSOCKETS.

Operator Response: Contact the system programmer.

System Programmer Response: Verify that the MAXSOCKETS value on the NETWORK statement in the BPXPRMxx parmlib member does not exceed the documented maximum.

BPXU001I VTAM CHANNEL COMMUNICATIONS FAILED. RETURN CODE = *return_code* **VTAM RESOURCE NAME =** *resourcename***, FUNCTION =** *function*

Explanation: Unable to establish a connection with the remote partner. An error was reported by VTAM during oeifconfig processing, or during data communications between the local entity and its remote partner. If the error occurred during the oeifconfig processing, the system could not configure or activate the connection to the identified VTAM resource.

In the message text:

return_code
The return code from the VTAM function call. Return codes from either the OSA adapter card or VTAM may be listed here. This field contains the OSA adapter return code if the listed FUNCTION call has the “OSA-” prefix. Otherwise it contains the VTAM return code. For more information about the OSA adapter return code, see *OSA/SF User's Guide for OSA-2*. For more information about the VTAM return code, see the chapter “Data Link Control (DLC) Status Codes” in *OS/390 SecureWay Communications Server: SNA Messages*.

resourcename
The name of the VTAM resource specified on the oeifconfig command.

function
The VTAM function call being processed at the time of the error.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXUIMPC

System Action: The identified VTAM resource is not activated. The system processing continues.

Operator Response: Contact the system programmer.

System Programmer Response: Do the following:

- Verify that the appropriate VTAM TRLE resource definition has been created for the failing VTAM resource.
- Verify that the CTC channel is online and that the “v net,act,xxx” command has been issued for the CTC channel in use.
- Verify that the remote partner has been correctly configured.
- If the problem is an OSA-2 error, correct the error.

After the condition has been rectified, reissue the oeifconfig shell command to activate the VTAM resource.

BPXU002I VTAM CHANNEL COMMUNICATIONS FAILED. RETRY LIMIT EXCEEDED. VTAM RESOURCE NAME = *resourcename***, FUNCTION =** *function*

Explanation: A retryable error condition was detected during oeifconfig processing. The error was retried. However, the channel initialization process repetitively failed after a preset number of attempts.

In the message text:

resourcename
The name of the VTAM resource specified on the oeifconfig command.

function
The VTAM function call being processed at the time the error occurred.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXUIMPC

System Action: The identified VTAM resource is not activated. The system processing continues.

Operator Response: Contact the system programmer.

System Programmer Response: Do the following:

- Verify that the appropriate VTAM TRLE resource definition has been created for the failing VTAM resource.
- Verify that the CTC channel is online and that the “v net,act,xxx” command has been issued for the CTC channel in use.
- Verify that the remote partner is online and ready.

After the condition has been rectified, then issue the oeifconfig shell command to activate the VTAM resource.

BPXU003I AN IP LAYER CONFIGURATION ERROR WAS DETECTED. VTAM RESOURCE NAME = *resource_name***, REASON CODE =** *reason_code*

Explanation: An error was detected during oeifconfig connection process. One or more of the IP layer configuration parameters specified by the remote partner cannot be accepted by the local entity. Note that this message may be asynchronous with the issuance of the oeifconfig command.

In the message text:

resource_name
The name of the VTAM resource specified on the oeifconfig command.

reason_code
The OS/390 UNIX reason code that identifies the error. For an explanation of the reason code, see *OS/390 UNIX System Services Messages and Codes*.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXUIMPC

System Action: The identified VTAM resource is not activated. The system processing continues.

Operator Response: Contact the system programmer.

System Programmer Response: Correct the problem indicated by the reason code and then reissue the oeifconfig command.

BPXU004I VTAM CHANNEL INITIALIZATION SUCCESSFUL. VTAM RESOURCE NAME = *resourcename*

Explanation: A connection with the remote partner, represented by the VTAM resource name, has been successfully established. Data transmission can begin.

In the message text:

resourcename
The name of the VTAM resource specified on the oeifconfig command.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXUIMPC

System Action: The identified VTAM resource is now activated. The system processing continues.

Operator Response: None.

System Programmer Response: None.

BPXU005I THE MAXSOCKETS VALUE OF *max-sockets-val* **HAS BEEN REACHED**

Explanation: During OS/390 UNIX TCP processing, the number of open sockets has reached the maximum value supported by the sockets physical file system.

In the message text:

max-sockets-val
The maximum sockets value specified on the NETWORK statement in the BPXPRMxx parmlib member.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXUTSYN

System Action: The request for a new socket is rejected. The system processing continues.

Operator Response: Contact the system programmer.

System Programmer Response: Increase the MAXSOCKETS value on the NETWORK statement in the BPXPRMxx parmlib member.

BPXW0000I EXEC NOT FOUND.

Explanation: The REXX program could not be found.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXWREXC

System Action: The REXX program is not run.

Operator Response: None.

User Response: Check the format of the REXX program and make sure you have permission to run the program. Also, make sure you specified the name with letters in the correct case (upper or lower). If you specified a relative name, check that the program can be found with the PATH environment variable used to run the REXX program.

When an external subroutine or function is called, you may see the IRX0043I (routine not found) message. Make sure the subroutine name is quoted if it contains lowercase or special characters.

System Programmer Response: None.

BPXW0001I STORAGE ALLOCATION ERROR.

Explanation: The OS/390 UNIX REXX preprocessor could not allocate enough storage to process the REXX program.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXWHLD

System Action: The REXX program is not run.

Operator Response: None.

User Response: Check whether the program is looping on a call to an external function or subroutine. Contact your system programmer.

System Programmer Response: Ensure the region size is sufficient for your application.

BPXW0002I UNABLE TO READ EXEC.

Explanation: The REXX program could not be read. The usual cause for this is that an I/O error occurred on the read operation.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXWHLD

System Action: The REXX program is not run.

Operator Response: None.

User Response: Ensure that the entire file can be read.

System Programmer Response: None.

BPXW0003I IMPROPER TEXT FILE.

Explanation: The REXX program is not a compiled exec and contains a line that is not terminated by a <newline> character.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXWHLD

System Action: The REXX program is not run.

Operator Response: None.

User Response: Check the format of the REXX program. Make sure each line is ended by a <newline> character.

System Programmer Response: None.

BPXW0004I PARAMETER STRING TOO LONG.

Explanation: The parameter passed to a REXX program exceeds 4096 characters. This is most likely to occur when you run a REXX program under the shell, using shell wildcards to pass a long file list or passing the output of another command as the parameter.

Source: OS/390 UNIX System Services kernel (BPX)

Detecting Module: BPXWREXC

System Action: The REXX program is not run.

Operator Response: None.

User Response: Run the REXX program with fewer parameters.

System Programmer Response: None.

CBDA Messages

CBDA070I UIM *uim-name1* tried to build a GIT for the generic *generic* that is already built by UIM *uim-name2*.

Explanation: Two user interaction modules (UIM) made multiple attempts to build a generic information table (GIT) for a generic device type. The system flags the first UIM as in error.

In the message text:

uim-name1 Name of the UIM that failed.

uim-name2 The name of the second UIM.

generic The name of the GIT.

Source: Hardware Configuration Definition (HCD)

Detecting Module: CBDMBGIT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA071I Duplicate preference value found in the UIMs *uim-name1* and *uim-name2* for the generics *gen-name1* and *gen-name2*.

Explanation: Two user interaction modules (UIM) specified the same generic priority (preference value). The system flags the last UIM as in error.

In the message text:

uim-name1 The name of the first UIM.

uim-name2 The name of the UIM that failed.

gen-name1 The name of the first generic.

gen-name2 The name of the second generic.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBGIT

System Action: HCD processing continues.

Application Programmer Response: If the problem is an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA072I UIM *uim-name* defines a compatible list for the generic *generic* that contains duplicate generics.

Explanation: A user interaction module (UIM) defines a generic device type with a compatible list that contains duplicate entries. The list of compatible generic devices contains one of the following:

- A reference to itself
- Two references to the same generic device type

The system flags the UIM as in error.

In the message text:

uim-name The name of the UIM that failed.

generic The name of the generic.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBGIT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA073I UIM *uim-name* tried to build a CIT for control unit *cutype* that is already built by UIM *uim-name2*.

Explanation: Two user interaction modules (UIM) made multiple attempts to build a control unit information table (CIT) for the indicated control unit. The system flags the UIM as in error.

In the message text:

uim-name1 The name of the UIM in error.

uim-name2 The name of the UIM that has already built the CIT.

cutype The type of control unit.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBCIT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA074I UIM *uim-name1* specified an invalid device number *dev* in the DFP. Return code =*return_code*.

Explanation: A user interaction module (UIM) specified a device number in the device feature parameter (DFP) list that is either greater than the allowed maximum (4095), or a DFP has already been built. This is probably a logic error in the indicated UIM. The system flags the UIM as in error.

In the message text:

uim-name1 The name of the UIM.

dev The incorrect device number.

return_code The return code.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA075I No GIT found for generic *gen-name* specified by UIM *uim-name* in the {DFP|UIP}

Explanation: The generic information table (GIT) could not be found for the generic that is specified by the indicated user interaction module (UIM) either in the:

- Device feature parameter (DFP) list
- Unit information parameter (UIP) list

There is probably a logic error in this UIM. The system flags the UIM as in error.

In the message text:

gen-name The name of the generic.

© Copyright IBM Corp. 1988, 1999

uim-name The name of the UIM in error.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA076I Invalid number of MLT names in the DFP specified by UIM ***uim-name*****.**

Explanation: A user interaction module (UIM) either specified more than 5 module list table (MLT) names or specified no MLT names in the device features parameter (DFP) list. There is probably a logic error in the UIM. The system flags the UIM as in error.

In the message text:

uim-name The name of the UIM.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA077I UIM *uim-name* **specified more than the allowed maximum of device-dependent information.**

Explanation: A user interaction module (UIM) specified more than 256 bytes of device-dependent information. There is probably a logic error in the UIM. The systems flags the UIM as in error.

In the message text:

uim-name The name of the UIM.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA078I Invalid UCB segment type *type* **for an ACON position pointer specified by UIM** *uim-name***.**

Explanation: A interaction module (UIM) specified an incorrect unit control block (UCB) segment type for an ACON position pointer. There is probably a logic error in the UIM. The systems flags the UIM as in error.

In the message text:

type The UCB segment type.

uim-name The name of the UIM.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA079I Invalid UCB segment type *type* **for an ACON relocation pointer specified by UIM** *uim-name***.**

Explanation: A user interaction module (UIM) specified an incorrect unit control block (UCB) segment type for an ACON relocation pointer. There is probably a logic error in the UIM. The systems flags the UIM as in error.

In the message text:

type The UCB segment type.

uim-name The name of the UIM.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA080I Invalid offset for an ACON position pointer specified by UIM *uim-name***.**

Explanation: A user interaction module (UIM) specified an offset for an ACON position pointer that is not within the specified unit control block (UCB) segment. There is probably a logic error in the UIM. The systems flags the UIM as in error.

In the message text:

uim-name The name of the UIM.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA081I UIM *uim-name1* **tried to build a UIT for device** *devtype* **that is already built by UIM** *uim-name2***.**

Explanation: Two user interaction modules (UIM) made multiple attempts to build a unit information table (UIT) for the device. The system flags the UIM as in error.

In the message text:

uim-name1 The name of the UIM that failed.

devtype The device type.

uim-name2 The name of the second UIM.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBUIT

System Action: HCD processing continues. The system ignores the first UIM.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA082I UIM *uim-name* **specified more than the allowed maximum of device-dependent segment data for device** *devtype* **on** *dev***.**

Explanation: A user interaction module (UIM) specified more than 24 bytes of device-dependent segment data. There is probably a logic error in the UIM. The system flags the UIM as in error.

In the message text:

uim-name The name of the UIM in error.

devtype The device type.

dev The device number.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues. The system ignores the first UIM.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA083I UIM *uim-name* **specified invalid device number** *dev* **in the relocation information. Return code=***return_code***.**

Explanation: A user interaction module (UIM) specified a device number greater than the maximum allowed number. There is probably a logic error in the UIM. The system flags the UIM as in error.

In the message text:

uim-name The name of the UIM in error.

dev The device number.

return_code A hex return code describing the cause of the error, as follows:

Return Code	Explanation
1	Device number in the relocation information is greater than maximum allowed device number.
2	Device number in the device class extension area is greater than maximum allowed device number.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA084I Invalid device class *ucbtype* **for device number** *dev* **specified by UIM** *uim-name***.**

Explanation: A user interaction module (UIM) specified an incorrect device class in the DFPTBYT3 field. The system flags the UIM as in error.

In the message text:

ucbtype The indicated device class.

dev The device number.

uim-name The name of the UIM in error.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDFT

System Action: HCD processing continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA085I The DCT information specified for DASD type *type* **does not match the previously specified information for this DASD type.**

Explanation: A user interaction module (UIM) supplies device characteristics information to the device characteristics table (DCT) build routine that is inconsistent with previously specified information.

In the message text:

type The direct access storage device (DASD) type.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDCT

System Action: The system enters wait state X'A5' with reason code X'085'.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA086I UIM *uim-name* **specified a DCT entry length greater than the allowed maximum.**

Explanation: A user interaction module (UIM) specified a length for a device characteristics table (DCT) entry that exceeds the allowed maximum length.

In the message text:

uim-name The name of the UIM.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDCT

System Action: The system enters wait state X'A5' with reason code X'086'.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA087I Insufficient space in DCT for current DCT entry

Explanation: A user interaction module (UIM) attempted to add an entry to the device characteristics table (DCT). Adding that entry would cause the size of the DCT to exceed the maximum possible size.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBDCT

System Action: The system enters wait state X'A5' with reason code X'087'.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that the problem is in an IBM-provided UIM (or any other IBM-provided code), see *OS/390 HCD User's Guide* and *DFSMS/MVS DFSMSdfp Diagnosis Guide* to diagnose the problem.

CBDA091I Compatible generic *genname1* **for generic** *genname2* **not found in GIT.**

Explanation: During initialization of the hardware configuration definition (HCD), the system validates the compatible generics of each generic information table (GIT) entry. The generic name found in the list of compatible generics does not have an entry in the GIT.

In the message text:

genname1 The name of the first generic.

genname2 The name of the second generic.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBGIT

System Action: The system deletes the first generic from the compatible generic list. HCD initialization continues.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA092I No UIT found for device *devtype* **on** *dev* **while updating generic by UIM** *uim-name***.**

Explanation: A user interaction module (UIM) attempted to update the generic device name for a device.

In the message text:

devtype The device type.

dev The device number.

uim-name The name of the UIM.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBUGN

System Action: HCD initialization continues. The system ignores the UIM.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA093I No GIT found for generic *genname* **to be used by UIM** *uim-name* **for device** *devtype* **on** *dev***.**

Explanation: A user interaction module (UIM) attempted to update the generic name for a device, but the hardware configuration definition (HCD) was unable to find the generic information table (GIT) for the generic. There is probably a logic error in the named UIM. The system flags the UIM as in error.

In the message text:

genname The name of the generic.

uim-name The name of the UIM in error.

devtype The device type.

dev The device number.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBUGN

System Action: HCD processing continues. The system ignores the UIM.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA094I Generic *genname* **cannot be updated for device** *devtype* **on** *dev* **by UIM** *uim-name***. Reason code =***reason_code***.**

Explanation: A user interaction module (UIM) attempted to update the generic name for the specified device. The system flags the UIM as in error.

In the message text:

genname The name of the generic.

devtype The device type.

dev The device number.

uim-name The name of the UIM in error.

reason_code The reason code, as follows:

1 The indicated UIM is not performing either a parameter check or feature check request.

2 The user interaction table (UIT) for the device concerned does not allow the update of the generic name depending on specified parameters or features.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMBUGN

System Action: HCD processing continues. The system ignores the UIM.

Application Programmer Response: If the problem is in an installation-provided UIM, correct the problem. If you suspect that it is a problem in an IBM-provided UIM, see *OS/390 HCD User's Guide* to diagnose the problem.

CBDA099I Internal logic error detected in module *name***. Reason code=** *reason_code***, error info =** *info3 info4 info5 info6 info7 indo8 info9*

Explanation: The hardware configuration definition (HCD) detected a logic error. The kind of error is described by the reason code. Depending on the reason code, further information may be provided.

In the message text:

name The name of the module.

info3 Information pertaining to the error.

info4 Information pertaining to the error.

info5 Information pertaining to the error.

info6 Information pertaining to the error.

info7 Information pertaining to the error.

info8 Information pertaining to the error.

info9 Information pertaining to the error.

reason_code The reason code.

Source: Hardware configuration definition (HCD)

Detecting Module: CBDMLUIT

System Action: The system abnormally ends HCD.

Application Programmer Response: Analyze the reason for the abnormal end. For diagnostic instructions see *OS/390 HCD User's Guide*.

CBDA800I IOS message queue open error, return code = *return_code*.

Explanation: An error occurred when the system tried to open the input/output supervisor (IOS) message queue.

In the message text:

return_code The return code from IOS.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the dynamic reconfiguration. HCD processing is ready to continue.

Application Programmer Response: Determine the error according to the return code given by IOS.

CBDA801I No I/O configuration information could be obtained, activation rejected.

Explanation: An error occurred while trying to obtain the I/O configuration information area. The system cannot obtain the information; therefore, dynamic reconfiguration is rejected.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBDA802I Unrecognizable I/O configuration information, activation rejected.

Explanation: An error occurred after obtaining the I/O configuration information area. The retrieved information could not be recognized.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: The error is probably caused by a mismatch between the HCD and MVS version being installed on the system. Notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBDA804I Activation in progress, please wait ....

Explanation: The activation of a new I/O configuration has started.

Source: Hardware Configuration Definition (HCD)

System Action: HCD continues processing.

CBDA805I IODF *dsname* is not a Production-IODF.

Explanation: The specified data set is not a Production-IODF. The dynamic configuration change is not possible.

In the message text:

dsname The specified data set.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Specify a data set which is a Production-IODF.

CBDA806I Recovery is recommended, specify either RECOVER or SOFT.

Explanation: A failure occurred in a previous dynamic configuration change, leaving the Hardware Configuration Definition (HCD) in an inconsistent state. Recovery is required to get HCD back to a consistent state. Until recovery is performed only software changes are allowed.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: To confirm the recover request specify RECOVER on the ACTIVATE command. If recovery is not required at this time, specify SOFT on the ACTIVATE command so that 'software only' changes can be performed.

CBDA807I Recovery data not available, activation restricted to software changes.

Explanation: Recovery was attempted, but the information required to recover from the failure could not be obtained. The activation is restricted to 'software only' changes.

Source: Hardware Configuration Definition (HCD)

System Action: The activation process continues with 'software only' changes. If the error persists, HCD remains in an inconsistent state.

Operator Response: Precede the configuration change with 'software only' changes, or cancel the activation process.

Application Programmer Response: ReIPL the system.

CBDA808I Processor *proc_id* not found in IODF *dsname*.

Explanation: The specified processor cannot be found in the IODF. The IODF must have been changed since the failing activation. The processor is required to handle the recovery request.

In the message text:

proc_id The identifier of the specified processor.

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation.

Operator Response: A 'software only' change may be done with another activation request. If this does not remove the recovery request from the system, reIPL the system to bring software and hardware into synchronization.

CBDA809I IOCDS *iocds* for processor *proc_id* not found in IODF *dsname*

Explanation: The input/output configuration data set (IOCDS) name cannot be found in the IODF for the indicated processor identifier.

In the message text:

iocds The specified IOCDS name.

proc_id The identifier of the specified processor.

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation.

Operator Response: Specify a valid IOCDS name for the processor.

CBDA810I Processor *proc_id* not found in *dsname*.

Explanation: The processor cannot be found in the indicated IODF.

In the message text:

proc_id The identifier of the specified processor.

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation.

Operator Response: Specify an existing processor ID.

CBDA811I Configuration ID *configuration_id* not found in *dsname*.

Explanation: The configuration definition cannot be found in the indicated IODF.

In the message text:

configuration_id The identifier of the specified configuration.

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation.

Operator Response: Specify an existing configuration ID.

CBDA812I EDT *edt_id* of configuration ID *config_id* not found in *dsname*.

Explanation: The eligible devices table (EDT) associated with the configuration ID cannot be found in the indicated IODF.

In the message text:

edt_id The identifier of the specified EDT.

config_id The identifier of the specified configuration.

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation.

Operator Response: Specify an existing EDT identifier.

CBDA813I Configuration ID required for *dsname*.

Explanation: A configuration ID for the indicated target IODF is required for the dynamic configuration change. No configuration ID was specified and no default ID could be determined.

If no configuration ID was specified, the default is determined by the following rules:

- If there is only one configuration ID in the IODF, this will be the default.
- If there is more than one configuration ID, the configuration ID of the source IODF is used as the default.
- If this configuration ID does not exist in the target IODF, the default is blank. No default can be determined.

In the message text:

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation.

Operator Response: Specify an existing configuration ID.

CBDA814I EDT ID required for *dsname*.

Explanation: An EDT ID for the indicated target IODF is required for the dynamic configuration change. No EDT ID was specified and no default ID could be determined.

If no EDT ID was specified, the default is determined by the following rules:

- If there is only one EDT ID in the IODF, this will be the default.
- If there is more than one EDT ID, the EDT ID of the source IODF is used as the default.
- If this EDT ID does not exist in the target IODF, the default is blank. No default can be determined.

In the message text:

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation.

Operator Response: Specify a valid EDT ID.

CBDA815I Processor ID is required.

Explanation: The processor ID is required for a full dynamic configuration change or a 'software only' change with hardware validation.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Specify a processor ID or restrict the activation to software definition changes only without hardware change validation.

CBDA816I Currently active I/O definition does not match IODF *dsname*, activation is rejected.

Explanation: The currently active I/O definition does not match the IODF that is supposed to be the current IODF. The current IODF must have been changed since it has become active. It must not be used as the base for a configuration change since it no longer reflects the current system definition.

In the message text:

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation request. HCD processing is ready to continue.

Application Programmer Response: Use a backup of the original IODF if it is available and copy it into the current IODF data set. Otherwise no configuration change is allowed.

CBDA817I Processors *proc_id1* and *proc_id2* are different processor models.

Explanation: The system found that the target processor is not the same as the source processor.

In the message text:

proc_id1 The specified target processor.

proc_id2 The specified source processor.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Respecify a target processor ID of the same model as the source processor ID, or if only software changes are requested, do not specify a processor ID.

CBDA818I Processors *proc_id1* and *proc_id2* are in different mode.

Explanation: The system found that the target processor does not have the same mode (LPAR or BASIC) as the source processor.

In the message text:

proc_id1 The specified target processor.

proc_id2 The specified source processor.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Respecify a target processor identifier with the same mode as the source processor identifier or, if only software changes are requested, do not specify a processor identifier.

CBDA819I Only software changes are allowed, specify SOFT for confirmation.

Explanation: A full dynamic configuration change was requested, but due to current system conditions the activation is restricted to software changes only.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing ends.

Operator Response: Specify the same request with the SOFT keyword to make 'software only' changes.

CBDA820I Processor *proc_id* not found in current IODF, H/W and S/W are out of sync.

Explanation: The activation request is restricted to 'software only' changes since the specified processor does not exist in the currently active IODF. The hardware definition does not match the the software definition. Only software changes are possible.

In the message text:

proc_id The identifier of the specified processor.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing continues with 'software only' changes.

CBDA821I Processor definition *proc_id* in current IODF *dsname* does not match current hardware definition, H/W and S/W are out of sync.

Explanation: The activation request is restricted to 'software only' changes since the processor definition of the currently active IODF does not match the current hardware configuration. The processor definition has been changed so that it cannot be used as base for hardware changes. Only software changes are possible.

In the message text:

proc_id The identifier of the specified processor.

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing continues with 'software only' changes.

CBDA822I Processor definition *proc_id* in IODF *dsname* does not match the processor definition to be used for recovery.

Explanation: A recovery from an activation failure was requested. To recover from the failure, it is necessary that the processor definitions have not changed since the failure occurred. The indicated processor was involved in the configuration change that failed but has been updated. Recovery is no longer possible.

In the message text:

proc_id The identifier of the specified processor.

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Application Programmer Response: Establish a consistent hardware definition to recover from the failure. A successful recovery is only possible if the Production-IODFs are unchanged or if the processors for which recovery is to be done are unchanged.

Use a backup of the IODF with the old processor definitions and copy it into the required data set.

If a backup is not available, a new power-on-reset is necessary to return HCD to a predictable state.

Operator Response: Request 'software only' changes by not confirming the recovery recommendation.

CBDA823I Request conflict - Software only changes and hardware deletes are mutually exclusive.

Explanation: 'Software only' changes as well as hardware deletions were requested. These functions are mutually exclusive.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Request only one of the specified functions.

CBDA824I Request conflict - Test activation only and hardware deletes are mutually exclusive.

Explanation: Test of activation only as well as hardware deletions were requested. These functions are mutually exclusive.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Request only one of the specified functions.

CBDA825I Request conflict - Test activation only and IOCDS related process are mutually exclusive. Test of activation only and write or switch of the input/output configuration data set (IOCDS) has been requested. These functions are mutually exclusive.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Request only one of the specified functions.

CBDA826I Not enough storage to perform the activation request.

Explanation: The system found that there was not enough storage to build the channel control block (CCB).

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Increase the region size.

CBDA827I No channel paths defined for processor *proc_id* **in** *dsname***.**

Explanation: No channel paths are defined for the processor. A processor without any channel paths defined cannot be used for a configuration change. Only software changes can be done.

In the message text:

proc_id The identifier of the specified processor.

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Confirm 'software only' changes or respecify the processor identifier.

CBDA828I Keyword *keyword* **not allowed, only software changes are possible.**

Explanation: The specified keyword is not allowed since the configuration change is restricted to 'software only' changes.

In the message text:

keyword The specified keyword.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing ends.

Operator Response: Respecify the request without the indicated keyword.

CBDA829I Keyword *keyword* **not allowed for this activation.**

Explanation: The specified keyword is not allowed for this activation (for example, RECOVER has been specified but no recovery is supposed to be done).

In the message text:

keyword The specified keyword.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing ends.

Operator Response: Respecify the request without the indicated keyword.

CBDA830I ACTIVATE command syntax error.

Explanation: The ACTIVATE command was entered incorrectly.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing ends.

Operator Response: Enter the ACTIVATE command again, using correct syntax. See *OS/390 MVS System Commands* for a description of the ACTIVATE command syntax.

CBDA832I ACTIVATE command syntax error, keyword *keyword* **not recognized.**

Explanation: The ACTIVATE command was entered incorrectly. The keyword indicated in the message is not valid.

In the message text:

keyword The specified keyword.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing ends.

Operator Response: Correct the command syntax. Enter the command again.

CBDA833I ACTIVATE command syntax error, keyword *keyword* **is duplicate.**

Explanation: The ACTIVATE command was entered incorrectly. The keyword indicated in the message is specified twice.

In the message text:

keyword The specified keyword.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing ends.

Operator Response: Correct the command syntax. Enter the command again.

CBDA834I ACTIVATE command syntax error, value for keyword *keyword* **is invalid.**

Explanation: The ACTIVATE command was entered incorrectly. The keyword indicated in the message has an incorrect value.

In the message text:

keyword The specified keyword.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing ends.

Operator Response: Correct the value of the keyword. Enter the command again.

CBDA835I ACTIVATE command syntax error, keywords *keyword1* **and** *keyword2* **are mutually exclusive.**

Explanation: The ACTIVATE command was entered incorrectly. The keywords indicated in the message must not be specified concurrently.

In the message text:

keyword1

keyword2 The specified keywords.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing ends.

Operator Response: Correct the command and enter it again.

CBDA836I IODF data set name *dsname1* **is not comparable to source IODF data set name** *dsname2***. Activation is rejected.**

Explanation: The IODF currently accessed by the Hardware Configuration Definition (HCD) must be comparable to the IODF which was used for IPL and which is the source IODF in the activation process. Comparable means that both IODF names must be equal except for the xx suffix of the 'nnnnnnnn.IODFxx' Production-IODF naming scheme.

In the message text:

dsname1 The specified IODF data set name.

dsname2 The specified IODF source data set name.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Use another IODF in HCD whose name is comparable to the IODF used for IPL.

CBDA837I Key word *keyword* not allowed, no validation possible since H/W and S/W are out of sync.

Explanation: The system rejects the activation request because no validation of hardware changes is possible. There is no processor in the currently active IODF that matches the hardware I/O configuration.

In the message text:

keyword The specified keyword.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Specify SOFT or SOFT=NOVALIDATE on the activation request and specify the request again.

CBDA839I An IOCDS member selection is required.

Explanation: An input/output configuration data set (IOCDS) member must be selected if a write or a switch of the IOCDS has been requested.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Select an IOCDS member or respecify the write and/or switch IOCDS request.

CBDA840I Currently active IODF *dsname* not found, activation rejected.

Explanation: The currently active IODF cannot be found. It has been either deleted or uncataloged.

In the message text:

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation request. HCD processing is ready to continue.

Operator Response: To make the requested IODF available, do one of the following:

- If the IODF is uncataloged, catalog it.
- If a backup is available use the backup data set.

CBDA841I IODF *dsname* not found, activation rejected.

Explanation: The indicated IODF is needed for the activation request but cannot be found. It has been either deleted or uncataloged.

In the message text:

dsname The specified data set name.

Source: Hardware Configuration Definition (HCD)

System Action: The system rejects the activation request. HCD processing is ready to continue.

Operator Response: Make the requested IODF available by one of the following:

- If the IODF is uncataloged, catalog it.
- If a backup is available use the backup data set.

CBDA842I No hardware configuration data available.

Explanation: The activation request is restricted to 'software only' changes because the hardware configuration data could not be retrieved due to either a software or hardware problem.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Application Programmer Response: Attempt to power-on-reset using an input/output configuration data set (IOCDS) that has been built by an IODF. If the error recurs, notify the system programmer.

System Programmer Response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBDA843I Hardware does not support the dynamic reconfiguration capability.

Explanation: The activation request is restricted to 'software only' changes since the processor does not support dynamic I/O reconfiguration.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: 'Software only' changes may be performed.

CBDA844I A configuration change is currently in progress.

Explanation: The activation request is restricted to 'software only' changes because another configuration change is currently in progress. This happens when an activation is being processed in another partition.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: Perform a configuration change only for software definitions or wait for the configuration change in progress to complete. Retry the activation request.

CBDA845I An IOCDS with wrong format is active.

Explanation: The activation request is restricted to 'software only' changes because an input/output configuration data set (IOCDS) has been used for power-on, which does not support the dynamic reconfiguration capability.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: 'Software only' changes may be performed.

Application Programmer Response: Perform a power-on-reset using an IOCDS which supports the dynamic reconfiguration capability. Create an IOCDS using HCD Version 1 Release 2 or later.

CBDA846I A previous activation failed and could not be backed-out.

Explanation: The activation request is restricted to 'software only' changes because an activation failed and could not be backed-out.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: 'Software only' changes may be performed.

Application Programmer Response: Perform a power-on-reset to establish full dynamic reconfiguration capability again.

CBDA847I Partition *partition* **missing, not defined for processor** *proc_id***.**

Explanation: The activation is rejected because the partition, which is described in the current active Hardware I/O Configuration Definition, is not defined for the new processor.

In the message text:

partition The partition described in the current active definition.

proc_id The identifier of the specified processor.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: A new power-on-reset is necessary to change partition names. Modify a channel path identifier (CHPID) definition in the new IODF so that it contains the missing partition name for a CHPID.

CBDA848I Invalid partition *partition* **defined for CHPID** *chpid***.**

Explanation: The IODF to be activated contains an incorrect partition defined for a channel path. The partition is not described in the current Hardware I/O Configuration Definition.

Source: Hardware Configuration Definition (HCD)

System Action: HCD processing is ready to continue.

Operator Response: A new power-on-reset is necessary to change partition names. Modify the CHPID definition in the IODF so that it contains the correct partition name for the CHPID.

CBDA849I Duplicate use of a serial number in the same IODF detected for device *dev***.**

Explanation: The serial number which can be used to identify "the same" device between two independent IODFs must be unique for all devices with the same device number in one IODF. Because this uniqueness is not fulfilled here, the serial number is not used to identify the matching device for this device number.

In the message text:

dev The specified device number.

Source: Hardware Configuration Definition (HCD)

System Action: HCD is ready to continue.

Operator Response: If the serial number is needed to identify the matching device, make the serial number unique for this device number again.

CBDA850I Illegal logical control unit split detected between the physical control units *cu_number1* **and** *cu_number2* **and device** *dev***.**

Explanation: An activation with the target IODF causes a logical control unit (LCU) to be split because a physical control unit is removed from the LCU that has devices remaining connected to it.

The split was detected between the specified physical control units in the target IODF that were connected to the specified device in the source IODF.

In the message text:

cu_number1

cu_number2 The specified control units.

dev The specified device number.

Source: Hardware Configuration Definition (HCD)

System Action: The system waits for the operator to respond.

Operator Response: Resolve the conflict by performing the activation in the following manner:

1. Delete all remaining devices from the physical control unit(s) to be removed from the LCU and activate this temporary configuration.
2. Activate the final configuration.

CBDA851I Illegal logical control unit merge detected between the physical control units *cu_number1* **and** *cu_number2* **and device** *dev***.**

Explanation: An activation with the target IODF causes an logical control unit (LCU) to be merged because a physical control unit is added to the LCU that has devices already connected to it.

The merge was detected between the specified physical control units in the source IODF which are connected to the specified device in the target IODF.

In the message text:

cu_number1

cu_number2 The specified control units.

dev The specified device number.

Source: Hardware Configuration Definition (HCD)

System Action: The system waits for the operator to respond.

Operator Response: Resolve the conflict by performing the activation in the following manner:

1. Delete all connected devices from the physical control unit(s) to be added to the LCU and activate this temporary configuration.
2. Then activate the final configuration.

CBR Messages

CBR0001I OAM initialization starting.

Explanation: The OAM control task has received control.

Source: Object access method (OAM)

System Action: OAM processing continues.

CBR0002I OAM initialization completed.

Explanation: OAM has successfully completed its initialization.

Source: Object access method (OAM)

System Action: OAM processing continues.

CBR0003I Invalid option specified with OSMC= keyword. Parameters specified = *parms*. Initialization terminated.

Explanation: The OSMC= startup keyword was specified with the PARM keyword on the JCL EXEC statement used to start OAM. An invalid option was specified following the OSMC= startup keyword. The OSMC= keyword must specify either OSMC=YES or OSMC=NO.

Source: Object access method (OAM)

System Action: OAM initialization stops.

CBR0004I PARMLIB member *member* not found. Initialization terminated.

Explanation: The OAM= startup keyword was specified with the PARM keyword on the JCL EXEC statement used to start OAM. The PARMLIB member CBROAMxx, whose low order two characters are identified by the OAM=xx keyword in the PARM field of the JCL EXEC statement in the OAM cataloged procedure, was not found.

Source: Object access method (OAM)

System Action: OAM initialization stops.

System Programmer Response: Perform the following actions:

- Verify that the correct low order two characters are specified with the OAM= keyword in the PARM field of the JCL EXEC statement in the OAM cataloged procedure in your PROCLIB data set.
- Verify that the member identified in the message is a member of the PARMLIB data set. If the member does not exist, create it.

CBR0005I Invalid name specified with APLAN= keyword. Parameters specified = *parms*. Initialization terminated.

Explanation: The APLAN= startup keyword was specified with the PARM keyword on the JCL EXEC statement used to start OAM. Following the APLAN= keyword should be the name of the DB2 plan used by OAM to access the optical configuration database. The name of the DB2 plan must be from one to eight characters in length. The DB2 plan name specified with the APLAN= keyword was less than one character or greater than eight characters.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify the length of the name of the DB2 plan specified with the APLAN= keyword with the PARM keyword on the JCL EXEC statement used to invoke OAM. The name should be from one to eight characters in length.

CBR0006D No DB2 subsystem ID supplied. Reply 'NONE' to continue without DB2, 'C' to cancel OAM, or specify a DB2 SSID.

Explanation: The name of the DB2 subsystem which is to be used to gain access to the optical configuration database is required during OAM initialization. This value is usually provided by SMS, which gets it from the DB2SSID keyword specified in the PARMLIB member IGDSMSxx. The DB2SSID keyword was not specified, so the SSID is not available for OAM use.

Source: Object access method (OAM)

System Action: OAM waits for an operator response.

Operator Response: If you know the DB2 subsystem ID, provide it in the response to the message; the ID must be from one to four characters in length. OAM uses the ID to establish a connection to DB2.

If you want to continue OAM initialization without DB2, reply **NONE** to the message; OAM initialization will continue, ignoring all optical device definitions.

If you do not know the ID, and you do not wish to bypass optical configuration processing, reply **C** to the message; OAM initialization stops.

System Programmer Response: This message will be issued during each OAM initialization until PARMLIB member IGDSMSxx is updated to include the DB2SSID keyword.

CBR0007I Name of OAM DB2 plan not specified. Initialization terminated.

Explanation: The APLAN= startup keyword was not specified with the PARM keyword on the JCL EXEC statement used to start OAM. The APLAN= startup keyword must be specified with the PARM keyword on the JCL EXEC statement used to start OAM. Following the APLAN= keyword should be the name of the DB2 plan used by OAM to access the optical configuration database. The name of the DB2 plan must be from one to eight characters in length.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Specify the name of the DB2 plan using the APLAN= keyword with the PARM keyword on the JCL EXEC statement used to invoke OAM. The name should be one to eight characters in length.

CBR0008I OAM is already active on this system. Initialization terminated.

Explanation: OAM has already been started on this system. Only one OAM address space can be active at a time.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: There is no need to start OAM again since it is already active. If you are attempting to restart OAM, you must wait until the previous invocation of OAM is stopped before attempting to bring OAM up again. Message CBR0099I will be issued when the previous invocation of OAM has stopped.

© Copyright IBM Corp. 1988, 1999

CBR0009I Unable to load user interface module. Initialization terminated.

Explanation: The OAM control task was unable to load the user interface module. The name of the user interface module is CBRWUI. This module should reside in the link pack area (LPA).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM was correctly installed and, using the AMBLIST utility, verify that module CBRWUI resides in the link pack area (LPA).

CBR0010I Unable to connect to the optical configuration database, RC = *return-code***. Initialization terminated.**

Explanation: The OAM control task was unable to connect to the optical configuration database. The OAM control task called module CBRKCAF to connect to the optical configuration database, but module CBRKCAF returned a nonzero return code *return-code*, indicating a failure during the connect. Return codes are for internal diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that the OAM optical configuration database was correctly defined and initialized. Verify that:

- The correct DB2 subsystem name was specified with the SSID keyword with the PARM keyword on the JCL EXEC statement used to invoke OAM
- The correct DB2 plan name was specified with the PLAN keyword with the PARM keyword on the JCL EXEC statement used to invoke OAM.

CBR0011I Unable to disconnect from the Optical Configuration Database, RC = *return-code***.**

Explanation: The OAM control task was unable to disconnect from the optical configuration database. The OAM control task called module CBRKCAF to disconnect from the optical configuration database, but module CBRKCAF returned a non-zero return code *return-code*, indicating a failure during the disconnect. Return codes are for internal diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM continues shut down processing.

Operator Response: Notify the system programmer.

System Programmer Response: Check for any preceding DB2 messages that may indicate the nature of the problem.

CBR0012I Unable to load OAM cross memory module. Initialization terminated.

Explanation: The OAM control task was unable to load the OAM cross memory module. The name of the cross memory module is CBRWXMEM. This module should reside in the link pack area (LPA).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM was correctly installed and, using the AMBLIST utility, verify that module CBRWXMEM resides in the link pack area (LPA).

CBR0013I Unable to load OAM CTC I/O driver. Initialization terminated.

Explanation: The OAM control task was unable to load the OAM CTC I/O driver module. The name of the CTC I/O driver module is CBRODRVR. This module should reside in the link pack area (LPA).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM was correctly installed and, using the AMBLIST utility, verify that module CBRODRVR resides in the link pack area (LPA).

CBR0014I Invalid option *option* **specified with keyword {MSG=|OTIS=|UPD=}, for the OAM entry in IEFSSNxx parmlib member. Default option for the invalid keyword is assumed.**

Explanation: One of the keywords specified on the OAM entry in the IEFSSNxx member of PARMLIB, was specified incorrectly.

- For keyword **MSG=**: An invalid option, *option* was specified following the **MSG=** keyword. Following the keyword must be one of the following options:

Option	Meaning
EM	OAM messages may consist of mixed case English characters.
EU	OAM messages will conform to the minimum character set consisting of upper case English letters, digits, special characters and blank.

- For keyword **OTIS=**: An invalid option, or no option was specified following the **OTIS=** keyword. Following the keyword must be one of the following options:

Option	Meaning
Y	OTIS address space will not start until JES has started.
N	OTIS address space will not wait for JES prior to starting.

- For keyword **UPD=**: An invalid option, or no option was specified following the **UPD=** keyword. Following the keyword must be one of the following options:

Option	Meaning
Y	OAM/OSREQ will update Pending Action Date (ODPENDDT) and Last Reference Date (ODLREFDT) on all OSREQ retrieves.
N	OAM/OSREQ will NOT update Pending Action Date (ODPENDDT) and Last Reference Date (ODLREFDT) on any OSREQ retrieves.

Source: Object access method (OAM)

System Action: OAM subsystem initialization continues. The default option for the invalid keyword is assumed.

Operator Response: Notify the system programmer.

System Programmer Response: Specify a valid option for the invalid keyword on the OAM entry in the IEFSSNxx member of PARMLIB. At the next IPL of the MVS operating system the change will become effective.

CBR0015I Error loading message module *module-name*. Default message option (MSG=EM) assumed.

Explanation: The **MSG=** keyword was specified on the OAM entry in the IEFSSNxx member of PARMLIB. OAM attempted to load the message module *module-name*, the load failed. The name of the message module that OAM attempts to load is CBRSMG*yy*, where *yy* is the option specified with the **MSG=***yy* keyword on the OAM entry in the IEFSSNxx member of PARMLIB.

Source: Object access method (OAM)

System Action: OAM subsystem initialization continues. The default message option **MSG=EM** is assumed.

Operator Response: Notify the system programmer.

System Programmer Response: Specify a valid option following the **MSG=** keyword on the OAM entry in the IEFSSNxx member of PARMLIB. Verify that message load module CBRSMG*yy* corresponds to the option you selected and was correctly installed in SYS1.LINKLIB during SMP/E APPLY processing for OAM. At the next IPL of the MVS operating system the change will become effective.

CBR0016I Successful processing of the {OAMXCF|SETOPT|SETOAM} commands in CBROAM*xx* member of PARMLIB. Initialization continues.

Explanation: OAM did not encounter any errors when processing the either the OAMXCF, SETOAM, or SETOPT commands in the CBROAMxx member of PARMLIB, where the xx characters are identified by either:

- the OAM=xx keyword in the PARM field of the JCL EXEC statement in the OAM cataloged procedure, or
- the OAM=xx keyword on the START OAM command.

The CBROAMxx member of PARMLIB is parsed twice during OAM initialization. once for OAMXCF commands, and a second time for SETOPT and SETOAM commands, at different points during OAM initialization.

This message indicates which PARMLIB member was used during this particular initialization of OAM. It is for documentation purposes only.

Source: Object access method (OAM)

System Action: OAM initialization continues.

Operator Response: None.

System Programmer Response: None.

CBR0017I OSMA not available, initialization terminated.

Explanation: The OSMA control block is not available to OAM for initialization.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM was correctly installed and verify that the OAM1 entry in the IEFSSNxx member of PARMLIB exists. At the next IPL of the MVS operating system, the change will become effective.

CBR0018I Unable to OPEN the Optical Configuration Database, RC = *return-code*. Initialization terminated.

Explanation: OAM was unable to OPEN the optical configuration database. Return codes are for internal diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM optical configuration database was correctly defined and initialized. Verify that:

- The correct DB2 subsystem name was specified in IGDSMSxx, or via a response to message CBR0006D. See message CBR0006D for more details.
- The correct DB2 plan name was specified with the APLAN keyword with the PARM keyword on the JCL EXEC statement used to invoke OAM.
- The OAM started task has the correct authority to OPEN the optical configuration database.

CBR0019I Unable to CLOSE the Optical Configuration Database, RC = *return-code*. Initialization terminated.

Explanation: OAM was unable to CLOSE the optical configuration database. Return codes are for internal diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that:

- The OAM optical configuration database was correctly defined and initialized.
- The correct DB2 subsystem name was specified in IGDSMSxx, or via a response to message CBR0006D. See message CBR0006D for more details.
- The correct DB2 plan name was specified with the APLAN keyword with the PARM keyword on the JCL EXEC statement used to invoke OAM.
- The OAM started task has the correct authority to access the optical configuration database.

CBR0020I Error during CTC initialization. Initialization terminated.

Explanation: An error occurred during the CTC initialization phase of OAM initialization. This message is preceded by other messages indicating the cause of the error.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Respond as indicated by the programmer response section for the preceding messages.

CBR0021I UCB not found for CTC *dev*. Initialization terminated.

Explanation: An error occurred during the CTC initialization phase of OAM initialization. The optical configuration database contained an entry for an optical disk drive or an optical disk library which indicated that the device was at channel-to-channel adapter address *dev*. OAM did not find an MVS Unit Control Block (UCB) for the specified device number.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that:

- all device numbers specified as the CTC device number in the drive table in the optical configuration database are indeed devices that have been defined to the MVS operating system.
- all device numbers specified as the CTC device number in the library table in the optical configuration database are indeed devices that have been defined to the MVS operating system.

CBR0022I UCB for device *dev* does not indicate that it is a CTC device. Initialization terminated.

Explanation: An error occurred during the CTC initialization phase of OAM initialization. The optical configuration database contained an entry for an optical disk drive or an optical disk library which indicated that the device was at channel-to-channel adapter address *dev*. OAM found an MVS Unit Control Block (UCB) for the specified device number, but the UCB did not indicate that the device was a channel-to-channel adapter.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that:

- all device numbers specified as the CTC device number in the drive table in the optical configuration database are indeed devices that have been defined to the MVS operating system as channel-to-channel adapters.
- all device numbers specified as the CTC device number in the library table in the optical configuration database are indeed devices that have been defined to the MVS operating system as channel-to-channel adapters.

CBR0023I Storage unavailable for CTC work area. Initialization terminated.

Explanation: An error occurred during the CTC initialization phase of OAM initialization. For each channel-to-channel adapter device used by OAM, a CTC work area is obtained from subpool 241 using the STORAGE OBTAIN macro and anchored to the MVS unit control block. The STORAGE OBTAIN macro for one of the CTC work areas failed. This message is preceded by message CBR7004I, which indicates the failing return code from the STORAGE macro.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

Application Programmer Response: Determine the cause of the STORAGE error by investigating the return code from the STORAGE macro and referring to the documentation for message CBR7004I.

CBR0024I Storage unavailable for CTC list. Initialization terminated.

Explanation: An error occurred during the CTC initialization phase of OAM initialization. During CTC initialization, the OAM constructs a list of all the unique CTC devices it uses. The STORAGE OBTAIN for an area of virtual storage in which to construct the CTC list failed. This message is preceded by message CBR7004I, which indicates the failing return code from the STORAGE OBTAIN macro.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the STORAGE OBTAIN error by investigating the return code from the STORAGE OBTAIN macro and referring to the documentation for message CBR7004I.

CBR0025I Invalid option specified with OAM= keyword. Parameters specified = *parms*. Initialization terminated.

Explanation: The OAM= startup keyword was specified with the PARM keyword on the JCL EXEC statement used to start OAM. An invalid value, or no value, was specified following the OAM= startup keyword. Following the OAM= keyword must be two alphanumeric characters. These two alphanumeric characters identify the low order suffix of the CBROAMxx member of PARMLIB that OAM is to read during OAM initialization.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Specify two alphanumeric characters immediately after the OAM= keyword on the PARM field of the JCL EXEC statement in the cataloged procedure used to start OAM.

CBR0026I Invalid option specified with MAXS= keyword. Parameters specified = *parms*. Initialization terminated.

Explanation: The MAXS= startup keyword was specified with the PARM keyword on the JCL EXEC statement used to start OAM. An invalid value was specified following the MAXS= startup keyword.

Source: Object access method (OAM)

System Action: OAM initialization stops.

System Programmer Response: The MAXS= keyword must either be omitted, in which case a default of two will be used, or specify a one or two digit numeric value.

CBR0027I SMS is not active on this system. Initialization terminated.

Explanation: The storage management subsystem (SMS) is not active on the system where OAM startup has been requested. OAM cannot operate without SMS.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Use the SET SMS operator command to start SMS, then start OAM again.

CBR0028I Error pinning UCB at address *address* **for device** *device-number***. Return code =** *return-code***, Reason code =** *reason-code***.**

Explanation: The OAM control task attempts to "pin" the MVS Unit Control Block (UCB) at address *address* for device *device-number* using the UCBPIN service. The request was unsuccessful. For diagnostic purposes, *return-code* and *reason-code* are the return code and reason code, respectively, from the UCBPIN service.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Repeat the OAM start-up procedure. If the failure persists, notify the system programmer.

System Programmer Response: For information on UCBPIN return codes and reason codes, see *OS/390 MVS Programming: Authorized Assembler Services Reference SET-WTO*. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR0029I Error unpinning UCB at address *address* **for device** *device-number***. Return code =** *return-code***, Reason code =** *reason-code***.**

Explanation: The OAM control task attempts to "unpin" the MVS Unit Control Block (UCB) at address *address* for device *device-number* using the UCBPIN service. The request was unsuccessful. For diagnostic purposes, *return-code* and *reason-code* are the return code and reason code, respectively, from the UCBPIN service.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Repeat the OAM start-up procedure. If the failure persists, notify the system programmer.

System Programmer Response: For information on UCBPIN return codes and reason codes, see *OS/390 MVS Programming: Authorized Assembler Services Reference SET-WTO*. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR0030I Unable to load CDS activation listen exit routine. Initialization terminated.

Explanation: The OAM control task was unable to load CBRCTLR, the listen exit routine which receives control from the event notification facility (ENF) when the Storage Management Subsystem (SMS) activates a control data set (CDS).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM has been correctly installed. Use the AMBLIST service aid to verify that module CBRCTLR resides in the Link Pack Area (LPA).

CBR0031I Unable to establish CDS activation listen exit routine, RC = *return-code***. Initialization terminated.**

Explanation: The OAM control task was unable to establish the Event Notification Facility (ENF) listen exit routine which receives control when the Storage Management Subsystem (SMS) activates a control data set (CDS). The ENF return code is given by *return-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Repeat the OAM start-up procedure. If the failure persists, notify the system programmer.

System Programmer Response: For information on ENF event codes, see *OS/390 MVS Programming: Authorized Assembler Services Guide*. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR0032I Unable to load OAM Resource Manager. Initialization terminated.

Explanation: The OAM control task was unable to load the OAM Resource Manager module. The name of the OAM Resource Manager module is CBRWRM. This module should reside in the link pack area (LPA).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM was correctly installed and, using the AMBLIST utility, verify that module CBRWRM resides in the link pack area (LPA).

CBR0033I Unable to establish OAM Resource Manager, RC = *return-code***. Initialization terminated.**

Explanation: An error occurred when the RESMGR macro was issued. The return code found in register 15 following the issuing of the RESMGR macro is *return-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For additional information on RESMGR macro return codes, see *OS/390 MVS Programming: Authorized Assembler Services Reference LLA-SDU*.

CBR0034I Unable to load OAM PC Routine for User Swap Control. Initialization terminated.

Explanation: The OAM control task was unable to load the OAM PC Routine for User Swap Control, load module CBRWPUSC. This module should reside in the link pack area (LPA).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM was correctly installed and, using the AMBLIST utility, verify that module CBRWPUSC resides in the link pack area (LPA).

CBR0035I Unable to load OAM SRB Routine for User Swap Control. Initialization terminated.

Explanation: The OAM control task was unable to load the OAM SRB Routine for User Swap Control, load module CBRWSUSC. This module should reside in the link pack area (LPA).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM was correctly installed and, using the AMBLIST utility, verify that module CBRWSUSC resides in the link pack area (LPA).

CBR0036I Unable to load the tape drive offline ENF listen exit routine. Initialization terminated.

Explanation: The OAM control task is unable to load the tape drive offline listen exit routine, which receives control from the event notification facility (ENF) when a tape drive is varied offline.

Source: Object Access Method (OAM)

System Action: OAM initialization terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that OAM has been correctly installed. Use the AMBLIST service aid to verify that module CBRCTLR2 resides in the link pack area (LPA).

CBR0037I Unable to establish the tape drive offline ENF listen exit routine, RC = *return-code*. Initialization terminated.

Explanation: The OAM control task is unable to establish the event notification facility (ENF) listen exit routine, which receives control when a tape drive is varied offline. The ENF return code is given by *return-code*.

Source: Object Access Method (OAM)

System Action: OAM initialization terminates.

Operator Response: Repeat the OAM start-up procedure. If the failure persists, notify the system programmer.

System Programmer Response: For information on ENF event codes, see *OS/390 MVS Programming: Authorized Assembler Services Guide*. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR0038I Invalid option specified with EJECT= keyword. Parameters specified = *parms*. Initialization terminated.

Explanation: The EJECT= startup keyword was specified with the PARM keyword on the JCL EXEC statement used to start OAM. An invalid option was specified following the EJECT= startup keyword. The EJECT= keyword must specify either EJECT=LRW or EJECT=LRM.

Source: Object access method (OAM)

System Action: OAM initialization stops.

CBR0039I Invalid option specified with RESTART= keyword. Parameters specified = *parms*. Initialization terminated.

Explanation: The RESTART= startup keyword was specified with the PARM keyword on the JCL EXEC statement used to start OAM. An invalid option was specified following the RESTART= startup keyword. The RESTART= keyword must specify either RESTART=YES or RESTART=NO.

Source: Object access method (OAM)

System Action: OAM initialization stops.

CBR0040I Invalid option specified with UNLOAD= keyword. Parameters specified = *parms*. Initialization terminated.

Explanation: The UNLOAD= startup keyword was specified with the PARM keyword on the JCL EXEC statement used to start OAM. An invalid value, or no value, was specified following the UNLOAD= startup keyword. Following the UNLOAD= keyword must be a decimal number from 0 to 9999. The UNLOAD keyword specifies the elapsed time (in seconds) before the least-recently-used drive within a 3995 optical disk library is unloaded, if there is no other online, operational and empty drive with the same 3995 optical disk library.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Specify a decimal number, between 0 and 9999 after the UNLOAD= keyword on the PARM field of the JCL EXEC statement in the cataloged procedure used to start OAM.

CBR0041I Error opening PARMLIB member *member*, return code = *return-code*. Initialization terminated.

Explanation: OAM encountered an error opening the PARMLIB member *member*. The PARMLIB member CBROAMxx low order two characters are identified by the OAM=xx keyword on the PARM field of the JCL EXEC statement in the OAM cataloged procedure. The return code was *return-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

System Programmer Response: Investigate the return code from the DFP OPEN macro by reading *DFSMS/MVS Macro Instructions for Data Sets*.

CBR0042I Error(s) discovered during processing of the CBROAM*xx* member of PARMLIB. Initialization terminated.

Explanation: OAM encountered one or more errors when processing the CBROAMxx member of PARMLIB, where the xx characters are identified by the OAM=xx keyword on the PARM field of the JCL EXEC statement in the OAM cataloged procedure. For each error a CBR03xxI message has been previously issued.

Source: Object access method (OAM)

System Action: OAM initialization stops.

System Programmer Response: Use the *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support* to determine correct values, then start OAM after making the corrections.

CBR0043I Error closing PARMLIB member *member*, return code = *return-code*. Initialization terminated.

Explanation: OAM encountered an error closing the PARMLIB member *member*. The return code was *return-code*. The PARMLIB member CBROAMxx low order two characters are identified by the OAM=xx keyword on the PARM field of the JCL EXEC statement in the OAM cataloged procedure.

Source: Object access method (OAM)

System Action: OAM initialization continues. Since the PARMLIB member has already been completely processed, there is no reason for this error to affect OAM processing.

System Programmer Response: Investigate the return code from the DFP CLOSE macro by reading *DFSMS/MVS Macro Instructions for Data Sets*.

CBR0044I Dynamic {allocation|unallocation} error. Return code = *return-code***, information reason code =** *info-reas***, error reason code =** *error-reas***. Initialization {terminated|continues}.**

Explanation: An error occurred during the processing of an SVC 99 dynamic allocation or dynamic unallocation request for PARMLIB. The return code found in register 15 following the SVC 99 request is *return-code*. The information reason code found in the S99INFO field of the SVC 99 request block is *info-reas*. The error reason code found in the S99ERROR field of the SVC 99 request block is *error-reas*.

If any messages were returned by the MVS dynamic allocation/unallocation service, then this message is followed by message CBR0045I and the messages returned by the MVS dynamic allocation/unallocation service.

Source: Object access method (OAM)

System Action: For dynamic allocation OAM initialization stops. For dynamic unallocation OAM initialization continues.

System Programmer Response: For additional information on the return codes, information reason codes and error reason codes from the dynamic allocation/unallocation service, see *OS/390 MVS Programming: Authorized Assembler Services Guide*.

CBR0045I The following *num-msgs* **messages were returned by the MVS dynamic {allocation|unallocation} service.**

Explanation: An error occurred during the processing of an SVC 99 dynamic allocation or dynamic unallocation request. The MVS dynamic allocation/unallocation service returned *num-msgs* messages to OAM. The messages returned by the MVS dynamic allocation service follow this message and are all part of the same multi-line write-to-operator (WTO).

Source: Object access method (OAM)

System Action: For dynamic allocation OAM initialization stops. For dynamic unallocation OAM initialization continues.

System Programmer Response: For additional information on the MVS dynamic allocation service see *OS/390 MVS Programming: Authorized Assembler Services Guide*.

CBR0046I *SVC-99-message*

Explanation: An error occurred during the processing of an SVC 99 dynamic allocation or dynamic unallocation request. The MVS dynamic allocation/unallocation service returned one or more messages to OAM. Each message returned by the MVS dynamic allocation/unallocation service is prefixed by the OAM message identifier CBR0046I and issued as part of a single multi-line write-to-operator (WTO).

Source: Object access method (OAM)

System Action: For dynamic allocation OAM initialization stops. For dynamic unallocation OAM initialization continues.

System Programmer Response: For additional information on the MVS dynamic allocation service see *OS/390 MVS Programming: Authorized Assembler Services Guide*.

CBR0047I Error calling the MVS PARMLIB access service, return code = *return-code***. Initialization terminated.**

Explanation: OAM uses the MVS PARMLIB access service (IEEMB888) as a part of the verification of member CBROAMxx. Member CBROAMxx contains the SETOAM command(s) with tape related parameters for OAM use.

The MVS PARMLIB access service returned with a non-zero return code. This is an internal service; formal publications and documentation on this service are not available. The return code is for diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs, and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR0048I Error obtaining storage for the MVS unit name verification service. GETMAIN return code = *return-code***.**

Explanation: OAM uses the MVS unit name verification service to get the list of devices which comprise each TAPEUNITNAME specified on a SETOAM command in the CBROAMxx PARMLIB member that is being processed during OAM initialization.

An error occurred trying to obtain storage for the MVS unit name verification service (IEFEB4UV). This is an internal service; formal publications and documentation on this service are not available. The return code is for diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM initialization processing continues until all CBROAMxx SETOAM parameters have been checked. Once all of the SETOAM parameters in this CBROAMxx PARMLIB member have been checked, OAM initialization terminates.

Operator Response: Notify the system programmer.

System Programmer Response: For additional information on the GETMAIN macro return codes see *OS/390 MVS Programming: Assembler Services Reference*.

CBR0049I Error releasing storage previously obtained for use by the MVS unit name verification service. FREEMAIN return code = *return-code***.**

Explanation: OAM uses the MVS unit name verification service to get the list of devices which comprise each TAPEUNITNAME specified on a SETOAM command in the CBROAMxx PARMLIB member that is being processed during OAM initialization.

An error occurred trying to release storage which OAM had previously obtained for the MVS unit name verification service (IEFEB4UV). This is an internal service; formal publications and documentation on this service are not available. The return code is for diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM continues processing.

Operator Response: Notify the system programmer.

System Programmer Response: For additional information on the FREEMAIN macro return codes, see *OS/390 MVS Programming: Assembler Services Reference*.

CBR0050I Error releasing storage that was obtained by the MVS unit name verification service. FREEMAIN return code = *return-code***.**

Explanation: OAM uses the MVS unit name verification service to get the list of devices which comprise each TAPEUNITNAME specified on a SETOAM command in the CBROAMxx PARMLIB member that is being processed during OAM initialization.

An error occurred trying to release storage which had been previously obtained by the MVS unit name verification service (IEFEB4UV). This is an internal service; formal publications and documentation on this service are not available. The return code is for diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM continues processing.

Operator Response: Notify the system programmer.

System Programmer Response: For additional information on the FREEMAIN macro return codes see *OS/390 MVS Programming: Assembler Services Reference*.

CBR0051I Error calling the EDTINFO service, return code = *return-code***, reason code =** *reason-code***.**

Explanation: OAM uses the EDTINFO service to get the list of devices which comprise each TAPEUNITNAME specified on a SETOAM command in the CBROAMxx PARMLIB member that is being processed during OAM initialization.

The EDTINFO service returned with a non-zero return code. The return code is for diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM initialization processing continues until all CBROAMxx SETOAM parameters have been checked. Once all of the SETOAM parameters in this CBROAMxx parmlib member have been checked, OAM initialization terminates.

Operator Response: Notify the system programmer.

System Programmer Response: For more information on EDTINFO return codes and reason codes, see *OS/390 MVS Programming: Assembler Services Reference*.

CBR0052I Error calling the MVS parameter parsing service for a {SETOAM|SETOPT|OAMXCF} statement, return code = *return-code***. Initialization terminated.**

Explanation: The MVS parameter parsing service (IEEMB887) returned with a non-zero return code *return-code* after an attempt to process a member in PARMLIB. This is an internal service; formal publications and documentation on this service are not available. The return code *return-code* is for diagnostic purposes only.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0053I Error {allocating|unallocating} the logical PARMLIB dataset concatenation. IEFPRMLB return code = *return-code* **and reason code =** *reason-code***. Initialization {terminated|continues}.**

Explanation: An error occurred using the IEFPRMLB service to dynamically allocate or unallocate the logical PARMLIB dataset concatenation. The return code following the request is *return-code* and the reason code is *reason-code*. The messages generated during IEFPRMLB processing will be issued to the OAM job log.

Source: Object access method (OAM)

System Action: For dynamic allocation OAM initialization stops. For dynamic unallocation OAM initialization continues.

System Programmer Response: For additional information on the return codes, and reason codes for the IEFPRMLB service, see *OS/390 MVS Programming: Authorized Assembler Services Guide*.

CBR0060I Storage unavailable for OVT control block. Initialization terminated.

Explanation: The control task attempted to GETMAIN storage for the OVT control block, but the GETMAIN failed. This message is preceded by message CBR7004I which contains the return code from the GETMAIN macro.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the GETMAIN error by investigating the return code from the GETMAIN macro and referring to the documentation for message CBR7004I.

CBR0061I Error freeing storage for LCB control block.

Explanation: The control task attempted to STORAGE RELEASE storage for the LCB control block, but the STORAGE RELEASE failed. This message is preceded by message CBR7004I which contains the return code from the STORAGE RELEASE macro.

Source: Object access method (OAM)

System Action: OAM initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to message CBR7004I, then determine the cause of the STORAGE RELEASE error by investigating the return code, using *OS/390 MVS Programming: Assembler Services Reference*.

CBR0062I Storage unavailable for LCB control block. Initialization terminated.

Explanation: The control task attempted to STORAGE OBTAIN storage for the LCB control block, but the STORAGE OBTAIN failed. This message is preceded by message CBR7004I which contains the return code from the STORAGE OBTAIN macro.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the STORAGE OBTAIN error by investigating the return code from the STORAGE OBTAIN macro and referring to the documentation for message CBR7004I.

CBR0063I Storage unavailable for ODCB control block. Initialization terminated.

Explanation: The control task attempted to STORAGE OBTAIN storage for the ODCB control block, but the STORAGE OBTAIN failed. This message is preceded by message CBR7004I which contains the return code from the STORAGE OBTAIN macro.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the STORAGE OBTAIN error by investigating the return code from the STORAGE OBTAIN macro and referring to the documentation for message CBR7004I.

CBR0064I Storage unavailable for VSCB control block. Initialization terminated.

Explanation: The control task attempted to STORAGE OBTAIN storage for the VSCB control block, but the STORAGE OBTAIN failed. This message is preceded by message CBR7004I which contains the return code from the STORAGE OBTAIN macro.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the STORAGE OBTAIN error by investigating the return code from the STORAGE OBTAIN macro and referring to the documentation for message CBR7004I.

CBR0065I Storage unavailable for VCB control block. Initialization terminated.

Explanation: The control task attempted to get storage for the VCB control block, but the STORAGE OBTAIN failed. This message is preceded by message CBR7004I which contains the return code from the STORAGE OBTAIN macro.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the STORAGE OBTAIN error by investigating the return code from the STORAGE OBTAIN macro and referring to the documentation for message CBR7004I.

CBR0066I Storage unavailable for TVCB control block. Initialization terminated.

Explanation: The control task attempted to get storage for the TVCB control block to add to the TVCB queue being built, but the STORAGE OBTAIN failed. This message is preceded by message CBR7004I which contains the return code from the STORAGE OBTAIN macro.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the STORAGE OBTAIN error by investigating the return code from the STORAGE OBTAIN macro and referring to the documentation for message CBR7004I.

CBR0070I OAM XCF member *member-name* is the first member defined to OAM XCF group *group-name*, group successfully defined to XCF and member created.

Explanation: During OAM initialization, the CBROAMxx PARMLIB member contained OAMXCF commands, specifying group and member names to be used by OAM to establish cross coupling facility communications in an OAMPLEX. This instance of OAM is the first member defined to OAM XCF group *group-name* so this invocation of XCF services successfully defined the OAM group to XCF and created OAM XCF member *-member-name* to that group.

Source: Object access method (OAM)

System Action: OAM initialization continues.

CBR0071I OAM XCF member *member-name* successfully created. OAM XCF group is *group-name*.

Explanation: During OAM initialization, the CBROAMxx PARMLIB member contained OAMXCF commands, specifying group and member names to be used by OAM to establish cross coupling facility communications in an OAMPLEX. The member *member-name* specified was successfully created in group *group-name*.

Source: Object access method (OAM)

System Action: OAM initialization continues.

CBR0072I Error attempting to process an XCF {JOIN | LEAVE | QUERY} for OAM XCF member *member-name*, OAM XCF group *group-name*, return code= *return-code*, reason code= *reason-code*.

Explanation: OAM received an error from XCF services attempting to do one of the following:

- join member *member-name* to group *group-name*
- member *member-name* leave from group *group-name*

The XCF service returned with XCF return code *return-code* and XCF reason code *reason-code*.

Source: Object access method (OAM)

System Action: If JOIN, OAM initialization stops, otherwise OAM continues processing.

Operator Response: Notify the system programmer.

System Programmer Response: An XCF service has failed. If the service that failed was doing a LEAVE of a member from a group, further cleanup is not necessary.

Refer to *OS/390 MVS Programming: Sysplex Services Reference* for the XCF return codes and reason codes.

CBR0073I Error updating XCF user state for OAM XCF member *member-name*, OAM XCF group *group-name*, return code= *return-code*, reason code= *reason-code*.

Explanation: OAM received an error from XCF services attempting to update the XCF user state for member *member-name* in group *group-name*.

The XCF service returned with XCF return code *return-code* and XCF reason code *reason-code*.

Source: Object access method (OAM)

System Action: OAM processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: An XCF service has failed. Refer to *OS/390 MVS Programming: Sysplex Services Reference* for the XCF return codes and reason codes.

CBR0074I OAM XCF member *member-name* **successfully left OAM XCF group** *group-name***.**

Explanation: During OAM termination, it was detected that this instance of OAM, *member-name* was a member of an OAM XCF group, *group-name*. An IXCLEAVE was successfully executed to leave the group when the OAM address space was requested to terminate.

Source: Object access method (OAM)

System Action: OAM termination continues.

CBR0075I Unable to establish a cross memory environment. Initialization terminated.

Explanation: The control task attempted to establish a cross memory environment by issuing a series of MVS system macros. The macros issued are ATSET, ETCRE and ETCON. This message is preceded by a message which contains the return code from the macro that failed.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the error by investigating the return code from the macro which failed.

CBR0080I Error establishing the {Operator Command Task | Library Control Task | Drive Control Task | OAM Storage Management Component Task | OAM XCF Control Task}. Initialization terminated.

Explanation: During the initialization phase of processing, the control task attempted to establish one of the major subtasks. The major subtasks are:

- Operator command task
- Library control task
- Drive control task
- OAM storage management component task
- OAM XCF control task.

The control task was unable to establish the subtask due to the ATTACH of the subtask failing or the subtask not initializing successfully.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Either the ATTACH failed or the subtask initialization failed. If the ATTACH failed, this message will be preceded by message CBR7000I which contains the return code from the ATTACH macro. If the subtask initialization failed, this message will be preceded by messages which further describe that failure. Refer to preceding messages.

CBR0081I Error re-establishing the {Operator Command Task | Library Control Task | Drive Control Task | OAM storage management component task | OAM XCF Control Task}. OAM processing terminates.

Explanation: During OAM processing, a major subtask ended abnormally. The major subtasks are:

- Operator command task
- Library control task
- Drive control task
- OAM storage management component task.
- OAM XCF control task.

The control task attempted to re-establish the failing subtask. This attempt failed due to the ATTACH of the subtask failing or the subtask not initializing successfully.

Source: Object access method (OAM)

System Action: OAM starts to shut down.

Operator Response: Notify the system programmer.

System Programmer Response: Either the ATTACH failed or the subtask initialization failed. If the ATTACH failed, this message will be preceded by message CBR7000I which contains the return code from the ATTACH macro. If the subtask initialization failed, this message will be preceded by messages which further describe that failure. Refer to preceding messages.

CBR0082I Error detaching the {Operator Command Task | Library Control Task | Drive Control Task | OAM storage management component task | OAM XCF Control Task}.

Explanation: The control task attempted to detach one of the major subtasks. The major subtasks are:

- Operator command task
- Library control task
- Drive control task
- OAM storage management component task.
- OAM XCF control task.

The control task was unable to detach the subtask.

Source: Object access method (OAM)

System Action: OAM processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: This message will be preceded by message CBR7001I which contains the return code from the DETACH macro. Refer to the documentation for message CBR7001I.

CBR0092I New SMS Source Control Data Set activated. OAM address space restart may be required.

Explanation: A new or modified SMS Source Control Data Set (SCDS) has been activated. The RESTART=NO option was specified on the JCL used to start the OAM address space. The configuration may have changed, however the OAM address space has been requested not to restart.

Source: Object access method (OAM)

System Action: Processing continues.

System Programmer Response: If changes were made to the SMS Source Control Data Set that will affect the OAM configuration, for example:

- Additions, deletions or modifications to object storage group definitions

- Additions, deletions or modifications to object backup storage group definitions
- Additions, deletions or modifications to optical library definitions
- Additions, deletions or modifications to optical drive definitions
- Additions, deletions or modifications to tape library definitions
- Modifications to ACS routines used in OAM object processing

the OAM address space should be restarted. Changes made relative to these constructs need to be reflected in the OAM address space.

Issue the MODIFY OAM,RESTART command to cause OAM restart processing to occur.

CBR0093E OAM has initialized without object support.

Explanation: OAM has initialized without object support as the result of a response to message CBR7516D. DB2 was not available when OAM was initializing. Although optical drives, optical libraries, and object storage groups may have been defined in the SMS Control Data Set, only tape libraries have been initialized.

Source: Object access method (OAM)

System Action: No object requests are honored.

System Programmer Response: When DB2 is available, stop and restart OAM or activate the SCDS to initialize OAM with object support.

CBR0094E OAM has initialized without tape or object support.

Explanation: The DB2 subsystem was not available when OAM was initialized. The operator responded to CBR7516D to continue without DB2 which allowed OAM to initialize without object support. There were also no tape libraries defined in the active configuration.

Source: Object access method (OAM)

System Action: No OAM requests are honored.

Operator Response: When DB2 is available, stop and restart OAM or activate the SCDS to initialize OAM with the object support defined in the active configuration. If your installation has tape libraries, activate the control data set (CDS) with tape libraries defined.

CBR0095E OAM waiting for SMS Control Data Set activation.

Explanation: OAM has initialized with a null configuration. No optical libraries and no tape libraries are defined in the active SMS configuration. No object storage groups are defined in the active SMS configuration or there are object storage groups defined, but they are not connected to the current system.

Source: Object access method (OAM)

System Action: OAM waits for operator action. No useful work can be done until a new configuration has been activated.

Operator Response: Notify the system programmer. If there are no plans to add definitions to the SMS Control Data Set in the near future, use the **STOP OAM** command to stop the OAM address space.

System Programmer Response: Define or update the correct configuration using the ISMF Storage Administrator library, drive, and storage group define panels. When the definitions are completed, activate the new SMS configuration. Once the new SMS configuration has been activated, use the **START OAM** command to start OAM.

CBR0096I OAM restart in progress.

Explanation: One of the following events has occurred:

- The storage management subsystem (SMS) has activated a new control data set (CDS) and RESTART=NO was not specified on the OAM procedure JCL.
- The MODIFY OAM,RESTART command was issued.

The OAM control task has begun the process of rebuilding its configuration.

Source: Object access method (OAM)

System Action: For optical library and tape object processing, all currently active requests are allowed to complete. Currently queued requests, that were previously submitted from outside the OAM address space, with the exception of requests from ISMF, are kept until the restart is complete. After the restart completes the requests are attempted and will either succeed or fail based on the contents of the new configuration. All other requests, that were submitted from within the OAM address space, or from ISMF, will be canceled with the reason code that indicates the OAM address space is not available; OSMC requests will be resubmitted with the next OSMC cycle. While the restart is in progress, new units of work that are submitted from outside of the OAM address space, with the exception of requests from ISMF, will be queued and are attempted when the restart is complete.

For tape library processing, independent of object tape processing, mount and demount requests will proceed without OAM address space involvement. Eject requests that were queued in the OAM address space at the time of the restart are sent to the library; completion processing will take place after OAM has restarted. Audit requests that were queued in the OAM address space at the time of the restart are purged; they may be resubmitted after OAM has restarted. Audit and eject requests attempted while the restart is in progress will fail. Cartridges may be entered into the library while the restart is in progress; they remain in the insert category and are processed during library initialization.

CBR0097I OAM restart completed.

Explanation: The storage management subsystem (SMS) has activated a new control data set (CDS); the configuration may have changed. The OAM control task has completed construction of the new configuration.

Source: Object access method (OAM)

System Action: OAM receives and processes all user requests.

CBR0098I OAM termination starting.

Explanation: The OAM control task has received a request to stop processing from the system operator.

Source: Object access method (OAM)

CBR0099I OAM termination completed.

Explanation: The OAM address space has stopped and has returned control to the MVS operating system.

Source: Object access method (OAM)

CBR0100I Unable to access library table. Return code = *return-code***, Reason code =** *reason-code***, SQL error code =** *SQL-error-code***, CAF error code =** *CAF-error-code***.**

Explanation: An error occurred attempting to access the OLIBRARY table in the optical configuration database. The return code and reason code from the optical configuration database access module (CBRKCMR) is *return-code* and *reason-code*, respectively. The SQL error reason code is *SQL-error-code*. The Call Attach Facility, CAF, error reason code is *CAF-error-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*.

CBR0101I Invalid number of slots *slots* **specified for library** *library-name***.**

Explanation: The number of slots *slots* specified for real optical disk library *library-name* is invalid. The number of slots must be 64 for an IBM 9246 optical disk library or greater than 0 for an IBM 3995 optical disk library.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the number of slots for the specified library in the library table in the DB2 optical configuration database using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0102I Invalid number of empty slots *slots* **specified for library** *library-name***.**

Explanation: The number of empty slots *slots* specified for real optical disk library or tape library *library-name* is invalid.

- The number of empty slots must be in the range 0 to 64 for an IBM 9246 optical disk library.
- The number of empty slots must be in the range 0 to the maximum slot count for any IBM 3995 optical disk libraries. This maximum slot count varies depending on the model of the 3995, check the model number to determine the slot maximum.
- The number of empty slots must be not less than 0 for a tape library.

Source: Object access method (OAM)

System Action: OAM initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: For optical: Correct the number of empty slots for the specified library in the library table in the DB2 optical configuration database using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

For tape: do nothing. When the library is varied online it will correct the number of empty slots.

CBR0103I Invalid number of drives *drives* **specified for library** *library-name***.**

Explanation: The number of drives *drives* specified for library *library-name* is invalid. The number of drives must be in the range for the library device type as follows:

Library device type	**Valid RANGE**
9246	0-4
3995-111	1-4
3995-112	1-4
3995-113	1-4
3995-131	1-5
3995-132	1-5
3995-133	1-5
3995-C3A	0-1
3995-C32	1-2
3995-C12	1-2
3995-C34	1-4
3995-C36	1-6
3995-C16	1-6
3995-C38	1-6
3995-C18	1-6

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the number of drives for the specified library in the library table in the DB2 optical configuration database. Use SPUFI to make the correction.

CBR0104I Invalid device number *dev* **specified for primary CTC for library** *library-name***.**

Explanation: The device number *dev* specified for the primary CTC for library *library-name* is invalid. The device number must consist of four hexadecimal digits (0 through 9 and A through F).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the device number of the primary CTC for the specified library using the ISMF Storage Administrator library alter panel.

CBR0105I Invalid port number *port-number* **specified for primary port for library** *library-name***.**

Explanation: The port number *port-number* specified for the primary port for real optical disk library *library-name* is invalid. The port number must be either 1 or 2 for an IBM 9246 optical disk library. The port number must be blank for an IBM 3995 optical disk library.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the port number of the primary port for the specified library using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0106I Invalid device number *device-number* **specified for alternate CTC for library** *library-name***.**

Explanation: The device number *device-number* specified for the alternate CTC for real optical disk library *library-name* is invalid.

For all optical disk libraries the device number must consist of four hexadecimal digits (0 through 9 and A through F).

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the device number of the alternate CTC for the specified library using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0107I Invalid port number *port-number* **specified for alternate port for library** *library-name***.**

Explanation: The port number *port-number* specified for the alternate port for real optical disk library *library-name* is invalid. The port number must be either 1 or 2 for an IBM 9246 optical disk library. The port number must be blank for an IBM 3995 optical disk library.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the port number of the alternate port for the specified library using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0108I Invalid library type *library-type* **specified for library** *library-name***.**

Explanation: The library type *library-type* specified for library *library-name* is invalid. The library type must be "R" (indicating real optical disk library or automated tape library), "P" (indicating pseudo optical disk library) or "M" (indicating manual tape library).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For an optical disk library, correct the library type for the specified library using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive). For a tape library, correct the library type for the specified library using the AMS ALTER function.

CBR0109I Invalid path status *path-status* **specified for library** *library-name***.**

Explanation: The path status *path-status* specified for real optical disk library *library-name* is invalid. For an IBM 9246 optical disk library the path status must be either "P" (indicating the primary path to the library is being used) or "A" (indicating the alternate path to the library is being used). For an IBM 3995 optical disk library the path status must be blank.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the path status column (PATHSTAT) in the row in the library table for the specified library using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0110I Invalid device type *device-type* **specified for library** *library-name***.**

Explanation: The device type *device-type* specified for library *library-name* is invalid. The device type must be one of the following:

Device type	Meaning
9246	IBM 9246 optical disk library
3995-111	IBM 3995 re-writable optical disk library
3995-112	IBM 3995 write-once optical disk library
3995-113	IBM 3995 multifunction optical disk library
3995-131	IBM 3995 re-writable optical disk library
3995-132	IBM 3995 write-once optical disk library
3995-133	IBM 3995 multifunction optical disk library
3995-C3A	IBM 3995 Controller for Cxx optical disk library
3995-C32	IBM 3995 multifunction optical disk library
3995-C12	IBM 3995 multifunction optical disk library
3995-C34	IBM 3995 multifunction optical disk library
3995-C36	IBM 3995 multifunction optical disk library
3995-C16	IBM 3995 multifunction optical disk library
3995-C38	IBM 3995 multifunction optical disk library
3995-C18	IBM 3995 multifunction optical disk library
3995-SW3	IBM 3995 "PSEUDO" library for 3995-SW3 operator accessible drives.
3995-SW4	IBM 3995 "PSEUDO" library for 3995-SW4 operator accessible drives.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the device type associated with the library using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0111I Invalid library index *library-index* **specified for library** *library-name***.**

Explanation: The library index *library-index* specified for library *library-name* is invalid.

Source: Object Access Method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the library index of the specified library using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive). The correct library index for each library device type type is as follows:

Library device type	Library Index Value
9246	0
3995-131	0
3995-132	0
3995-133	0
3995-C3A	0
3995-111	1
3995-112	1
3995-113	1

3995-C32	1
3995-C34	1
3995-C36	1
3995-C38	1
3995-C12	2
3995-C14	2
3995-C18	2

CBR0112I Invalid library default media type *library-default-media-type* **specified for library** *library-name***.**

Explanation: The library default media type *library-default-media-type* specified for library *library-name* is invalid.

Source: Object Access Method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the library default media type (MEDIATYP) specified the library using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive). Use one of the following values in the default media type column:

- '3995 '
- '3995-1 '
- '3995-1RW'
- '3995-1WO'
- '3995-2 '
- '3995-2RW'
- '3995-2WO'
- '3995-4 '
- '3995-4RW'
- '3995-4WO'
- '3995-8 '
- '3995-8RW'
- '3995-8WO'
- '3995WORM'
- '3995REWR'

CBR0113I Invalid number of {MEDIA1|MEDIA2|MEDIA3|MEDIA4} scratch volumes, *volume-count***, specified for library** *library-name***.**

Explanation: The scratch volume count *volume-count* for the indicated media type in library *library-name* is invalid. The scratch count is less than zero.

Source: Object Access Method (OAM)

System Action: OAM initialization continues. The scratch volume count for the indicated media type is set to zero.

Operator Response: Notify the system programmer.

System Programmer Response: As part of library initialization or VARY SMS,LIBRARY,ONLINE processing, OAM will automatically replace this value with information retrieved from the library.

CBR0114I Invalid {MEDIA1|MEDIA2|MEDIA3|MEDIA4} scratch volume message threshold, *message-threshold***, specified for library** *library-name***.**

Explanation: The scratch volume threshold *message-threshold* for the indicated media type in library *library-name* is invalid. The message threshold is less than zero.

Source: Object Access Method (OAM)

System Action: OAM initialization continues. The message threshold for the indicated media type is set to zero. No message threshold processing will be done for this media type in this library.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the specified media type scratch volume message threshold associated with the library by using either the ISMF ALTER function of the tape library application, or by using the IDCAMS ALTER command and restart the OAM address space.

CBR0115I SMS library definitions unavailable. SSI RC = *SSI-return-code***, SMS RC =** *SMS-return-code***, SMS REASON =** *SMS-reason-code***.**

Explanation: During OAM initialization processing, a subsystem interface (SSI) call to the storage management subsystem (SMS) has been made to determine the library configuration in the active control data set (ACDS). The call failed. The return code from the SSI is given by *SSI-return-code*; the return code from SMS is given by *SMS-return-code*; and the reason code from SMS construct access services is given by *SMS-reason-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on the SMS return codes and reason codes see *DFSMS/MVS DFSMSdfp Diagnosis Reference*. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR0116I SMS optical library *library-name* **not found in Optical Configuration Database.**

Explanation: Optical library *library-name* is defined in the Storage Management System (SMS) active control data set (ACDS), but is not defined in the library table in the DB2 optical configuration database.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Whether the library name is incorrectly specified in the CDS, or the library definition is missing in the library table, the correction is the same: use the ISMF Storage Administrator library delete function to delete the current library definition, then use the library define panel to create a new definition.

CBR0117I Invalid default pseudo library name *plib-name* **for library** *library-name***.**

Explanation: Optical library *library-name* is defined with a default pseudo library name *plib-name*. The pseudo library name specified is not a valid library name in the active configuration.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the default pseudo library specified for the library to a valid pseudo library in the configuration.

CBR0118I Tape library record for library *library-name* not found in the TCDB.

Explanation: Library *library-name* is part of the active SMS configuration. During OAM address space initialization, an attempt was made to read the tape library record for this library from the tape configuration database (TDCB). The record does not exist.

Source: Object Access Method (OAM)

System Action: OAM initialization terminates.

System Programmer Response: Using the ISMF library management application:

1. Get a list of the libraries defined in the SMS SCDS.
2. Use the DELETE line operator to delete library *library-name*.
3. Use the define panel to create a new definition of library *library-name*. This will cause a tape library record to be written in the TDCB .
4. Activate the newly modified SCDS.

If the ISMF procedure fails, create the tape library record in the TDCB using the IDCAMS CREATE LIBENTRY command.

CBR0119I Entry default data class for library *library-name* not available.

Explanation: The entry default data class for tape library *library-name* was not available during OAM address space initialization. One of the following has occurred:

- An entry default data class was not defined for this library.
- The entry default data class was defined but contained up-level media interchange values which are not supported by the level of OAM software on this system.
- An error occurred when OAM tried to retrieve the data class definition from SMS.

Source: Object Access Method (OAM)

System Action: OAM initialization continues. The default values for the tape device selection information are set as follows:

1. For an automated tape library dataserver, the library vision system determines the media type when the cartridge is entered. OAM uses this information to set the media type.

   For a manual tape library dataserver, there is no default. Specify this value through the library manager console, through the programmed interface for manual cartridge entry or through the cartridge entry installation exit (CBRUXENT).
2. For MEDIA1, if the volume use attribute is PRIVATE, OAM sets 36-track recording technology. If the volume use attribute is SCRATCH, OAM does not set the recording technology.
3. For MEDIA2, OAM always sets 36-track as the recording technology.
4. For MEDIA3 or MEDIA4, OAM always sets 128-track as the recording technology.
5. Compaction is always set to unknown regardless of whether entry default dataclass was specified.

System Programmer Response: To set different defaults:

1. Use the ISMF data class application to define a data class with the desired values for tape recording technique and media type.
2. Use the ISMF library management application to assign the data class as the entry default data class for this library.
3. Activate the new configuration to make the data class definition effective.

If the default values are acceptable, no action is required. Also, the cartridge entry installation exit (CBRUXENT) can be used to set the tape device selection information.

CBR0120I Unable to access slot table. Return code = *return-code*, Reason code = *reason-code*, SQL error code = *SQL-error-code*, CAF error code = *CAF-error-code*.

Explanation: An error occurred attempting to access the SLOT table in the optical configuration database. The return code and reason code from the optical configuration database access module (CBRKCMR) is *return-code* and *reason-code*, respectively. The SQL error reason code is *SQL-error-code*. The Call Attach Facility, CAF, error reason code is *CAF-error-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*.

CBR0121I Invalid slot name *slot-name* in slot table.

Explanation: The slot table contains a row that contained an invalid slot name *slot-name*. The slot name must consist of three decimal digits (0 through 9) or the three characters "GRP" or the three characters "IO ".

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

Application Programmer Response: Correct the row in the slot table that contains the invalid slot name. Use SPUFI to make the correction.

CBR0123I Slot name *slot-name* invalid for library *library-name*.

Explanation: There is a row in the slot table for slot *slot-name* in library *library-name*. The slot name specified in the slot table is greater than the number of slots contained in the library as specified in the library table.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the definition of slot *slot-name* for library *library-name* in the slot table in the DB2 optical configuration database. Use SPUFI to make the correction.

CBR0124I Definition of slot *slot-name* in library *library-name* missing.

Explanation: There is no row in the slot table for slot *slot-name* in library *library-name*.

System Action: OAM will automatically create a row in the slot table for the missing slot. OAM initialization continues.

Source: Object access method (OAM)

CBR0125I Definition of slot *slot-name* in library *library-name* created.

Explanation: There was no row in the slot table for slot *slot-name* in library *library-name*. OAM successfully created a row in the slot table for slot *slot-name* in library *library-name*. The newly created row indicates that the slot is empty and operational.

Source: Object access method (OAM)

System Action: OAM initialization continues.

CBR0126I Definition of slot *slot-name* in library *library-name* unsuccessful.

Explanation: There is no row in the slot table for slot *slot-name* in library *library-name*. OAM attempted to add a row in the slot table for slot *slot-name* in library *library-name*. The attempt to add the row was unsuccessful.

Source: Object access method (OAM)

System Action: OAM initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: Check the succeeding message indicating the cause the error.

CBR0127I Return code = *return-code*, Reason code = *reason-code*, SQL error code = *SQL-error-code*, CAF error code = *CAF-error-code*.

Explanation: An attempt to dynamically create a slot definition in the slot table for a missing slot failed. This message is preceded by message CBR0126I. Message CBR0126I contains the name of the slot and the name of the library containing the slot. The return code and reason code from the optical configuration database access module (CBRKCMD) is *return-code* and *reason-code*, respectively. The SQL error reason code is *SQL-error-code*. The call attachment facility, CAF, error reason code is *CAF-error-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*. After the problem has been corrected, restart OAM.

CBR0128I Invalid slot occupied status *occupied-status* associated with slot *slot* in library *library-name*.

Explanation: The slot occupied column (OCCUPIED) in the row in the slot table in the optical configuration database for slot *slot* in library *library-name* contains an invalid value. The acceptable values are:

Value	Meaning
Y	The slot is currently occupied.
N	The slot is currently empty.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the slot occupied column (OCCUPIED) in the row, in the slot table in the optical configuration database, associated with the specified slot and library. Correct the row using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0129I Invalid slot operational status *operational-status* associated with slot *slot* in library *library-name*.

Explanation: The slot operational column (OPERATNL) in the row in the slot table in the optical configuration database slot *slot* in library *library-name* contains an invalid value. The acceptable values are:

Value	Meaning
Y	The slot is currently operational which indicates a cartridge can be stored in this slot.
N	The slot is not currently operational which indicates a cartridge should not be stored in this slot.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the slot operational column (OPERATNL) in the row, in the slot table in the optical configuration database, associated with the specified slot and library. Correct the row using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0130I Invalid console name *consname* associated with library *library-name*.

Explanation: The console name *consname* specified for library *library-name* in the tape configuration database (TDCB) is invalid.

Source: Object Access Method (OAM)

System Action: OAM initialization continues. Console name message routing cannot be performed for the library.

System Programmer Response: Verify that the console name is correctly defined in a CONSOLxx member of PARMLIB, and that this member was included when the system was most recently IPLed. The console name specified on the ISMF library define panel can be updated using the ISMF library alter panel.

CBR0140I Unable to access drive table. Return code = *return-code*, Reason code = *reason-code*, SQL error code = *SQL-error-code*, CAF error code = *CAF-error-code*.

Explanation: An error occurred attempting to access the Drive Table in the optical configuration database. The return code and reason code from the optical configuration database access module (CBRKCMR) is *return-code* and *reason-code*, respectively. The SQL error reason code is *SQL-error-code*. The call attach facility, CAF, error reason code is *CAF-error-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*.

CBR0141I Unknown library name *library-name* specified for drive *drive-name*.

Explanation: One of the following statements is true for the library name *library-name* specified for drive *drive-name*:

- The library is not defined in the SMS ACDS.
- The library definition in the SMS ACDS contained errors.
- The library is defined in the SMS ACDS, however it is connected to more than one system in a sysplex, and this instance of OAM does not belong to an OAMPLEX; therefore, any optical libraries connected to more than one system are ignored.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: If the library name in the drive definition is in error, correct the library name using the ISMF Storage Administrator drive delete function and drive define panel. If the library definition is missing from the SMS CDS, add the definition using the library define panel. If the library definition is in error, follow the instructions for the message describing that error.

CBR0142I Invalid device number *dev* **specified for CTC for drive** *drive-name***.**

Explanation: The device number *dev* specified for the CTC for drive *drive-name* is not a valid device number. The device number must be four hexadecimal digits (0 through 9 and A through F).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the device number specified for the CTC for the specified drive using the ISMF Storage Administrator drive alter panel.

CBR0143I Invalid SCSI bus address *bus-address* **specified for drive** *drive-name***.**

Explanation: The SCSI bus address *bus-address* for drive *drive-name* is not valid. The SCSI bus address for an IBM 9247 optical disk drive must be 0 through 7. The SCSI bus address for an IBM 3995 optical disk drive must be blank.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the SCSI bus address specified for drive *drive-name* using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0144I Invalid logical unit number *lun* **specified for drive** *drive-name***.**

Explanation: The logical unit number *lun* for drive *drive-name* is not valid. The logical unit number for an IBM 9247 optical disk drive must be 0 through 7. The logical unit number for an IBM 3995 optical disk drive must be blank.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the logical unit number specified for drive *drive-name* using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0145I Invalid library drive number *library-drive-number* **specified for drive** *drive-name***.**

Explanation: The library drive number *library-drive-number* for drive *drive-name* is not valid. The following table shows valid drive numbers for each optical library device type.

Library device type	Valid Drive Numbers
9246	0-3
3995-111	1-4
3995-112	1-4
3995-113	1-4
3995-131	1-5
3995-132	1-5
3995-133	1-5
3995-C3A	1
3995-C12	1-2
3995-C16	1-6
3995-C18	1-6
3995-C32	1-2
3995-C34	1-4
3995-C36	1-6
3995-C38	1-6

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the library drive number specified for drive *drive-name* using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0146I Invalid number of drives *number-of-drives* **defined as residing in library** *library-name***.**

Explanation: The number of drives defined as residing in library *library-name* in the SMS ACDS is invalid.

The number of drives must be within the range for the library device type as follows:

Library device type	Valid Number of Drives
9246	0-3
3995-111	1-4
3995-112	1-4
3995-113	1-4
3995-131	1-5
3995-132	1-5
3995-133	1-5
3995-C3A	0-1
3995-C32	1-2
3995-C12	1-2
3995-C34	1-4
3995-C36	1-6
3995-C16	1-6
3995-C38	1-6
3995-C18	1-6

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: If no drives have been defined for the library, use the ISMF Storage Administrator drive define panel to add one or more drive definitions. If too many drives have been defined, use the drive delete function to delete one or more drive definitions.

CBR0147I No optical drive definition was found in the active SMS configuration during OAM initialization.

Explanation: An optical library was defined in the active SMS configuration, but there are no corresponding optical disk drives defined in the active SMS configuration.

Source: Object access method (OAM)

System Action: OAM initialization stops. No useful work can be done until a new SMS configuration has been activated.

Operator Response: Notify the system programmer.

System Programmer Response: Define the correct complete SMS configuration using the ISMF Storage Administrator library, drive, and storage group define panels. When the definitions are completed, activate the modified SMS control data set (CDS), then start OAM with the new active SMS configuration.

CBR0149I Duplicate library drive number *library-drive-number* **specified for drive** *drive-name***.**

Explanation: The library drive number *library-drive-number* for drive *drive-name* is the same as the library drive number specified for another optical drive in the same library.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the library drive number specified for drive *drive-name* using the ISMF Storage Administrator drive alter panel.

CBR0150I Invalid drive type *drive-type* **specified for drive** *drive-name***.**

Explanation: The drive type *drive-type* for drive *drive-name* is not valid. The drive type must be one of the following:

Value	Meaning
L	The drive is library-resident. Cartridges are mounted on the drive and demounted from the drive automatically, without the assistance of an operator, using the robotics within the optical disk library.
S	The drive is stand-alone or operator-accessible. Cartridges are mounted on the drive and demounted from the drive by an operator.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the drive type specified for drive *drive-name* in the Drive Table in the DB2 optical configuration database using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0151I Invalid device type *device-type* **specified for drive** *drive-name***.**

Explanation: The device type *device-type* for drive *drive-name* is not valid. The device type must be one of the following:

Value	Meaning
9247	The drive is an IBM 9247 optical disk drive.
3995-111	The drive is an IBM 3995-111 optical disk drive.
3995-112	The drive is an IBM 3995-112 optical disk drive.
3995-113	The drive is an IBM 3995-113 optical disk drive.
3995-131	The drive is an IBM 3995-131 optical disk drive.
3995-132	The drive is an IBM 3995-132 optical disk drive.
3995-133	The drive is an IBM 3995-133 optical disk drive.
3995-C3A	The drive is an IBM 3995-C3A optical disk drive.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the device type specified for drive *drive-name* in the Drive Table in the optical configuration database using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0152I Drive type *drive-type* **for drive** *drive-name* **is inconsistent with library type** *library-type* **for library** *library-name***.**

Explanation: The drive type *drive-type* for drive *drive-name* is not consistent with library type *library-type* for library *library-name*. The drive type must be one of the following:

Value	Meaning
L	The drive is library-resident. The library type column (OLIBTYPE) in the row in the library table, for the library containing this drive, should contain the character "R", indicating the library is a real optical disk library.
S	The drive is stand-alone or operator-accessible. The library type column (OLIBTYPE) in the row in the library table, for the library containing this drive, should contain the character "P", indicating the library is a pseudo optical disk library.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the drive type specified for drive *drive-name* in the Drive Table or correct the library type specified for library *library-name* in the Library Table. Use SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive) to make the corrections.

CBR0153I Device type *device-type-1* **for drive** *drive-name* **is inconsistent with device type** *device-type-2* **for library** *library-name***.**

Explanation: The device type *device-type-1* for drive *drive-name* is not consistent with device type *device-type-2* for library *library-name*. The device type associated with the drive and the device type associated with the library must match the following table:

Drive device type	Library device type
9247	9246
3995-111	3995-111
3995-112	3995-112
3995-113	3995-113
3995-131	3995-131
3995-132	3995-132
3995-133	3995-133
3995-SW3	3995-C3A, 3995-C32,3995-C12, 3995-C34, 3995-C36, 3995-C16,3995-C38, 3995-C18,

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the device type specified for drive *drive-name* in the Drive Table or correct the device type specified for library *library-name* in the Library Table. Use SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive) to make the corrections.

CBR0155I SMS optical drive definitions unavailable. SSI RC = *SSI-return-code*, SMS RC = *SMS-return-code*, SMS REASON = *SMS-reason-code*.

Explanation: During OAM initialization processing, a subsystem interface (SSI) call to the storage management subsystem (SMS) has been made to determine the optical drive configuration in the active control data set (ACDS). The call failed. The return code from the SSI is given by *SSI-return-code*; the return code from SMS is given by *SMS-return-code*; and the reason code from SMS construct access services is given by *SMS-reason-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on the SMS return codes and reason codes see *DFSMS/MVS DFSMSdfp Diagnosis Reference*. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR0156I SMS optical drive *drive-name* not found in Optical Configuration Database.

Explanation: Optical drive *drive-name* is defined in the Storage Management System (SMS) active control data set (ACDS), but is not defined in the drive table in the DB2 optical configuration database.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Whether the drive name is incorrectly specified in the CDS, or the drive definition is missing in the drive table, the correction is the same: use the ISMF Storage Administrator drive delete function to delete the current drive definition, then use the drive define panel to create a new definition.

CBR0157I Cannot find a real library for standalone drive *drive-name*.

Explanation: During OAM initialization, the real library could not be located for standalone drive *drive-name*.

Source: Object access method (OAM)

System Action: This drive will be unknown to OAM until problem is fixed.

Operator Response: Notify the system programmer.

System Programmer Response: Check your ISMF library and drive definitions for this drive, and correct the definition for this drive. Once OAM is started again if the drive is correctly defined, it will be known to OAM.

CBR0161I Unknown library name *library-name* specified for storage group *storage-group-name*.

Explanation: One of the following statements is true for the library name *library-name* specified for storage group *storage-group-name*:

- The library is not defined in the SMS ACDS.
- The library definition in the SMS ACDS contained errors.
- The library is defined in the SMS ACDS, however it is connected to more than one system in a sysplex, and this instance of OAM does not belong to an OAMPLEX; therefore, any optical libraries connected to more than one system are ignored.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: If the library name in the storage group definition is in error, correct the library name using the ISMF storage group alter panel. If the library definition is missing from the SMS ACDS, add the definition using the library define panel. If the library definition is in error, follow the instructions for the message describing that error.

CBR0162I Storage group *storage-group-name* is defined as enabled to more than one system in the SMS ACDS.

Explanation: Storage group *storage-group-name*, in the SMS ACDS, is defined as enabled to the current system and at least one more system in the configuration. The current environment does not support storage groups enabled to multiple systems.

Source: Object access method (OAM)

System Action: The storage group is not added to the optical configuration. OAM initialization continues.

System Programmer Response: If the storage group must be used by this system, you must either:

- In a single system environment, define the storage group enabled to only this system in the current SCDS.

  or

- In an OAM supported parallel sysplex environment, specify the appropriate commands in the CBROAMxx parmlib member to enable XCF processing for OAM.

  If OAM parallel sysplex support is installed on this system, this instance of OAM must join a XCF group for storage groups to be defined as enabled to more than one system.

CBR0163I Library *library-name* is defined as connected to more than one system in the SMS ACDS.

Explanation: Library *library-name*, in the SMS ACDS, is defined as connected to the current system and at least one more system in the configuration. The current environment does not support optical libraries connected to multiple systems.

Source: Object access method (OAM)

System Action: The library is not added to the optical configuration. OAM initialization continues.

System Programmer Response: If the library must be accessed by this system, you must either:

- In a single system environment, define the library connected to only this system in the current SCDS.

  or

- In an OAM supported parallel sysplex environment, specify the appropriate commands in the CBROAMxx parmlib member to enable XCF processing for OAM.

  If OAM parallel sysplex support is installed on this system, this instance of OAM must join a XCF group for optical libraries to be defined as connected to more than one system.

CBR0168I Volume location *volume-location* **for volume** *volser* **is inconsistent with library type** *library-type* **for library** *library-name***.**

Explanation: The volume location *volume-location* for volume *volser* is not consistent with library type *library-type* for library *library-name*. The volume location must be one of the following:

Value	Meaning
L	The volume resides inside a real optical disk library. For a volume that is library resident, the library type column (OLIBTYPE) in the row in the library table, for the library containing this volume, should contain the character "R", indicating the library is a real optical disk library.
S	The volume is shelf-resident; it does not reside inside of a real optical disk library. For a volume that is shelf-resident, the library type column (OLIBTYPE) in the row in the library table, for the library containing this volume, should contain the character "P", indicating the library is a pseudo optical disk library.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the volume location specified for volume *volser* in the volume table or correct the library type specified for library *library-name* in the library table. Use SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive) to make the corrections.

CBR0169I Media type *media-type* **for volume** *volser* **is inconsistent with device type** *device-type* **for library** *library-name***.**

Explanation: The media type *media-type* for volume *volser* is not consistent with device type *device-type* for library *library-name*. The media type associated with the volume and the device type associated with the library containing the volume must match the following table:

Volume media type	Library device type
00	9246
01	3995-111, 3995-131, 3995-113, 3995-133, 3995-C12, 3995-C16, 3995-C18, 3995-C32, 3995-C34, 3995-C36, 3995-C38, 3995-C3A
03	3995-112, 3995-132, 3995-113, 3995-133, 3995-C12, 3995-C16, 3995-C18, 3995-C32, 3995-C34, 3995-C36, 3995-C38, 3995-C3A
11	3995-113 3995-133, 3995-C12, 3995-C16, 3995-C18, 3995-C32, 3995-C34, 3995-C36, 3995-C38, 3995-C3A
13	3995-113 3995-133, 3995-C12, 3995-C16, 3995-C18, 3995-C32, 3995-C34, 3995-C36, 3995-C38, 3995-C3A
15	3995-113 3995-133, 3995-C12, 3995-C16, 3995-C18, 3995-C32, 3995-C34, 3995-C36, 3995-C38, 3995-C3A
21	3995-C12, 3995-C16, 3995-C18, 3995-C32, 3995-C34, 3995-C36, 3995-C38, 3995-C3A
23	3995-C12, 3995-C16, 3995-C18, 3995-C32, 3995-C34, 3995-C36, 3995-C38, 3995-C3A
25	3995-C12, 3995-C16, 3995-C18, 3995-C32, 3995-C34, 3995-C36, 3995-C38, 3995-C3A

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the media type specified for volume *volser* in the volume table or correct the device type specified for library *library-name* in the library table. Use SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive) to make the corrections.

CBR0170I Invalid volume location *location* **associated with volume** *volser***.**

Explanation: The volume location column (LOCATION) in the row in the volume table in the optical configuration database for volume *volser* contains an invalid value. The acceptable values are:

Value	Meaning
S	The volume is shelf resident; it resides outside of a real optical disk library.
L	The volume is library resident; it resides inside of a real optical disk library.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the volume location column (LOCATION) in the row, in the volume table in the optical configuration database, associated with the volume. Correct the row using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0171I Invalid volume type *volume-type* **associated with volume** *volser***.**

Explanation: The volume type column (TYPE) in the row in the volume or tape volume table in the optical configuration database for volume *volser* contains an invalid value. The valid values are:

Value	Meaning
B	The volume is a backup volume associated with the SMS OBJECT BACKUP storage group.
G	The volume is a group volume associated with an SMS OBJECT storage group.
S	The volume is a scratch volume.

Source: Object access method (OAM)

System Action: OAM initialization continues. The volume table row or tape volume table row is skipped. Until the table row is changed to contain a valid value, and OAM is stopped then started to recognize that new valid value, no work which requires the skipped volume will be done. The requests will fail with a return/reason code pair which indicates that OAM does not know about the volume which was skipped during initialization.

Operator Response: Notify the system programmer.

System Programmer Response: Using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive), correct the volume type column (TYPE) in the row in the volume or tape volume table in the optical configuration database. When the row contains a valid value, stop and then start OAM so that OAM will recognize the changed volume type column. Recognition of the valid volume type will add the volume to OAM's inventory such that requests for the volume will be able to be processed again.

CBR0172I Invalid volume orientation *orientation* **associated with volume** *volser***.**

Explanation: The volume orientation column (ORIENT) in the row in the volume table in the optical configuration database for volume *volser* contains an invalid value. The acceptable values are:

Value	Meaning
0	This volume is an IBM 9247 volume and resides on side 0 of the optical disk cartridge.
1	This volume is an IBM 9247 volume and resides on side 1 of the optical disk cartridge.
blank	This volume is an IBM 3995 volume.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the volume orientation column (ORIENT) in the row, in the volume table in optical configuration database, associated with the volume. Correct the row using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0173I Invalid volume full status *full-status* **associated with volume** *volser***.**

Explanation: The volume full status column (FULL) in the row in the volume or tape volume table in the optical configuration database for volume *volser* contains an invalid value. The valid values are:

Value	Meaning
Y	The volume is full.
N	The volume is not full.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the volume full status column (FULL) for this optical volume or tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM set the volume full status column (FULL) for this volume to 'N' signifying that the volume is **not** full.

Operator Response: Notify the system programmer.

System Programmer Response:

If your installation does not want the volume to be marked full, then do nothing.

If your installation does want the volume to be marked full:

1. Stop OAM.
2. Using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive), change the volume full status column (FULL) for volume *volser* in the volume or tape volume table in the optical configuration database to 'Y'.
3. Start OAM.

CBR0174I Invalid volume readable status *readable-status* **associated with volume** *volser***.**

Explanation: The volume readable status column (READABLE) in the row in the volume or tape volume table in the optical configuration database for volume *volser* contains an invalid value. The valid values are:

Value	Meaning
Y	The volume label can be read.
N	The volume label cannot be read.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the volume readable status column (READABLE) for this optical volume or tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM set the volume readable status column (READABLE) for this volume to 'Y' signifying that the volume is readable.

Operator Response: Notify the system programmer.

System Programmer Response:

If your installation wants the volume to be marked readable, do nothing.

If your installation does not want the volume to be marked readable, then:

1. Stop OAM.
2. Using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive), change the volume readable status column (READABLE) for volume *volser* in the volume or tape volume table in the optical configuration database to 'N'.
3. Start OAM.

CBR0175I SMS storage group constructs unavailable. SSI RC = *SSI-return-code***, SMS RC =** *SMS-return-code***, SMS REASON =** *SMS-reason-code***.**

Explanation: During OAM initialization processing, a subsystem interface (SSI) call to the storage management subsystem (SMS) has been made to determine the storage groups in the active control data set (ACDS). The call failed. The return code from the SSI is given by *SSI-return-code*; the return code from SMS is given by *SMS-return-code*; and the reason code from SMS construct access services is given by *SMS-reason-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on the SMS return codes and reason codes see *DFSMS/MVS DFSMSdfp Diagnosis Reference*. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR0176I Invalid volume writeable status *writeable-status* **associated with volume** *volser***.**

Explanation: The volume writeable status column (WRITABLE) in the row in the volume or tape volume table in the optical configuration database for volume *volser* contains an invalid value. The valid values are:

Value	Meaning
Y	Additional data may be written on this volume.
N	No more data may be written on this volume.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the volume writeable status column (WRITABLE) for this optical volume or tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM set the volume writeable status column (WRITABLE) for this volume to 'Y', signifying that additional data may be written to this volume.

Operator Response: Notify the system programmer.

System Programmer Response:

If your installation wants to allow additional data to be written to this volume, then do nothing.

If your installation does not want to allow any more data to be written to this volume, then:

1. Stop OAM.
2. Using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive), change the volume writeable status column (WRITABLE) for volume *volser* in the volume or tape volume table in the optical configuration database to 'N'.
3. Start OAM.

CBR0177I Invalid volume write protected status *protect-status* **associated with volume** *volser***.**

Explanation: The volume write protected status column (WRTPROT) in the row in the volume table in the optical configuration database for volume *volser* contains an invalid value. The acceptable values are:

Value	Meaning
Y	The volume is write-protected and cannot be written to.
N	The volume is not write-protected and can be written to.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the volume write protected status column (WRTPROT) in the row, in the volume table in optical configuration database, associated with the volume. Correct the row using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0178I Invalid volume free space *free-space* **associated with volume** *volser***.**

Explanation: The volume free space column (FRESPACE) in the row in the volume or tape volume table in the optical configuration database for volume *volser* contains an invalid value.

- For an optical volume the volume free space column (FRESPACE) should not contain a negative value.
- For a tape volume the volume free space column (FRESPACE) should not contain a negative value.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the volume free space column (FRESPACE) for this optical volume or tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM updated the row for this volume to set the volume writable status column (WRITABLE) to 'N' signifying that no more data can be written to this volume.

All requests for this volume, which are **not** write requests, will continue to be processed by OAM. However, until the table row is changed to contain a valid value in the volume free space column, the WRITABLE column is set back to 'Y', and OAM is stopped then started to recognize the new values, no more data can be written to this volume. Attempts to write data to this volume will fail with a return/reason code pair which indicates that the volume is not writeable.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0179I Invalid number of deleted objects *deleted-objects* **associated with volume** *volser***.**

Explanation: The number of deleted objects (DELCOUNT) in the row in the volume table in the optical configuration database for volume *volser* contains an invalid value.

For an IBM 3995 rewritable volume the number of deleted objects (DELCOUNT) should not contain a negative value.

For an IBM 3995 write-once volume or an IBM 9247 write-once volume, the number of deleted objects column (DELCOUNT) is not used and should always contain a value of zero.

Source: Object access method (OAM)

System Action: OAM initialization continues.

For an IBM 3995 rewritable volume the number of deleted objects is re-calculated, based on the current contents of the delete-object-table in the optical configuration database, and the DELCOUNT column in updated.

For an IBM 3995 write-once volume or an IBM 9247 volume, the number of deleted objects column (DELCOUNT) is set to zero.

Operator Response: Notify the system programmer.

System Programmer Response: Report this message to an IBM programming service representative.

CBR0180I Unable to access volume table. Return code = *return-code***, Reason code =** *reason-code***, SQL error code =** *SQL-error-code***, CAF error code =** *CAF-error-code***.**

Explanation: An error occurred attempting to access the VOLUME table in the optical configuration database. The return code and reason code from the optical configuration database access module (CBRKCMR) is *return-code* and *reason-code*, respectively. The SQL error reason code is *SQL-error-code*. The call attachment facility, CAF, error reason code is *CAF-error-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*.

CBR0181I Unknown library name *library-name* **specified for volume** *volser***.**

Explanation: One of the following statements is true for the library name *library-name* specified for storage group *storage-group-name*:

- The library is not defined in the SMS ACDS.
- The library definition in the SMS ACDS contained errors.
- The library is defined in the SMS ACDS, however it is connected to more than one system in a sysplex, and this instance of OAM does not belong to an OAMPLEX; therefore, any optical libraries connected to more than one system are ignored.

Source: Object access method (OAM)

System Action: The volume is not added to the optical configuration. OAM initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: If the library name in the volume definition is in error, correct the library name in the Volume Table in the DB2 optical configuration database, using SPUFI. If the library definition is missing from the SMS CDS, add the definition using the ISMF Storage Administrator library define panel. If the library defi-

nition is in error, follow the instructions for the message describing that error. If a new configuration is being activated, and if the volume is not to be part of that configuration, no action is necessary.

CBR0182I Unknown storage group name *storage-group-name* **specified for volume** *volser***.**

Explanation: One of the following statements is true for storage group *storage-group-name* specified for volume *volser*:

- The storage group is not defined in the SMS ACDS.
- The storage group definition in the SMS ACDS contained errors.
- The storage group is defined in the SMS ACDS, however it is enabled to more than one system in a sysplex, and this instance of OAM does not belong to an OAMPLEX; therefore, any object storage groups enabled to more than one system are ignored.

Source: Object access method (OAM)

System Action: The volume is added to the optical configuration. OAM initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: If the storage group name in the volume definition is in error, correct the storage group name in the Volume Table in the DB2 optical configuration database, using SPUFI. If the storage group definition is missing from the SMS CDS, add the definition using the ISMF Storage Administrator object storage group or object backup storage group define panel. If the storage group definition is in error, follow the instructions for the message describing that error. If a new configuration is being activated, and either the volume is not to be part of that configuration, or the volume will always be used by specifying the volume serial number, no action is necessary. One may want choose this volume above others, however, if the library is full and it is necessary to perform a volume eject.

CBR0183I Invalid slot name *slot-name* **specified for volume** *volser***.**

Explanation: The slot name specified for volume *volser* is not a valid slot name. A slot name consists of three decimal digits (0 through 9) or the three characters "GRP" or the three characters "IO " (IO and a blank).

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the slot name specified for volume *volser* in the Volume Table in the DB2 optical configuration database, using SPUFI.

CBR0184I Slot name *slot-name* **does not exist in library** *library-name***,**

Explanation: The slot name *slot-name* specified for volume *volser* is not a valid slot name in library *library-name*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the slot name specified for volume *volser* in the Volume Table in the DB2 optical configuration database, using SPUFI.

CBR0185I Invalid volume media type *media-type* **associated with volume** *volser***.**

Explanation: The volume media type column (MEDIATYP) in the row in the volume or tape volume table in the optical configuration database for volume *volser* contains an invalid value. The valid values are:

Value	Meaning
00	The volume is an IBM 9247 volume.
01	The volume is an IBM 3995 650 MB rewritable volume.
02	The volume is a standard IBM cartridge system tape.
03	The volume is an IBM 3995 650 MB write-once volume.
04	The volume is an enhanced capacity IBM cartridge system tape.
05	The volume is a High Performance Cartridge Tape.
06	The volume is an Extended High Performance Cartridge Tape.
11	The volume is an IBM 3995 1300 MB rewritable volume.
13	The volume is an IBM 3995 1300 MB write-once volume.
15	The volume is an IBM 3995 1300 MB write-once volume.
21	The volume is an IBM 3995 2600 MB rewritable volume.
23	The volume is an IBM 3995 2600 MB write-once volume.
25	The volume is an IBM 3995 2600 MB write-once volume.

Source: Object access method (OAM)

System Action: OAM initialization continues. The volume table row or tape volume table row is skipped. Until the table row is changed to contain a valid value, and OAM is stopped then started to recognize that new valid value, no work which requires the skipped volume will be done. The requests will fail with a return/reason code pair which indicates that OAM does not know about the volume which was skipped during initialization.

Operator Response: Notify the system programmer.

System Programmer Response: Using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive), correct the volume media type column (MEDIATYP) in the row in the volume or tape volume table in the optical configuration database. When the row contains a valid value, stop and then start OAM so that OAM will recognize the changed volume type column. Recognition of the valid volume media type will add the volume to OAM's inventory such that requests for the volume will be able to be processed again.

CBR0186I Invalid volume empty status *empty-status* **associated with volume** *volser***.**

Explanation: The volume empty status column (VOLEMPTY) in the row in the volume table in the optical configuration database for volume *volser* contains an invalid value. For an IBM 3995 rewritable volume, the following are acceptable values:

Value	Meaning
Y	The volume is logically empty.
N	The volume is not logically empty.

The volume empty status column (VOLEMPTY) is not used for an IBM 9247 volume or an IBM 3995 write-once volume, and should always contain the character N.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the volume empty status column (VOLEMPTY) in the row, in the volume table in the optical configuration database, associated with the volume. Correct the row using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive).

CBR0187I Error determining number of deleted objects and amount of deleted space on volume *volser***. Return code =** *return-code* **Reason code =** *reason-code* **SQL error code =** *SQL-error-code* **CAF error code =** *CAF-error-code* **CAF reason code =** *CAF-reason-code***.**

Explanation: OAM attempted to determine the number of deleted objects and amount of logically deleted space on volume *volser* by examining the rows in the deleted objects table. The examination of the rows in the deleted objects table failed.

Source: Object access method (OAM)

System Action: OAM initialization processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*.

CBR0188I Invalid amount of deleted space *deleted-space* **associated with volume** *volser***.**

Explanation: The amount of logically deleted space (DELSPACE) in the row in the volume table in the optical configuration database for volume *volser* contains an invalid value.

For an IBM 3995 rewritable volume, the deleted space column (DELSPACE) contains a negative value.

For an IBM 3995 write-once volume or an IBM 9247 volume, the deleted space column (DELSPACE) is not used and should always contain a value of zero.

Source: Object access method (OAM)

System Action: OAM initialization continues.

For an IBM 3995 rewritable volume the amount of deleted space is recalculated, based on the current contents of the deleted-objects-table in the optical configuration database, and the DELSPACE column is updated.

For an IBM 3995 write-once volume or an IBM 9247 volume, the deleted space column (DELSPACE) is set to zero.

Operator Response: Notify the system programmer.

System Programmer Response: Report this message to an IBM programming service representative.

CBR0189I Error updating row in volume table for volume *volser***. Return code =** *return-code* **Reason code =** *reason-code* **SQL error code =** *SQL-error-code* **CAF error code =** *CAF-error-code* **CAF reason code =** *CAF-reason-code***.**

Explanation: OAM attempted to update the row in the volume table in the optical configuration database for volume *volser*. The update failed. The purpose of the update was to adjust the number of logically deleted objects (DELCOUNT) column and the amount of logically deleted space (DELSPACE) column associated with the volume.

Source: Object access method (OAM)

System Action: OAM initialization processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*.

CBR0190I Volume/Slot inconsistent.

Explanation:

```
------- SLOT TABLE ------- ------- VOLUME TABLE -------
LIBRARY  SLT VOL0   VOL1   VOL0   LIBRARY  SLT O VOL1   REASONS
lib1     st1 vol1   vol2   vol3   lib2     st2 o vol4   errors
```

The information in the volume table is inconsistent with the information in the slot table. This message contains selected information from the Volume Table and the slot table. The following fields are displayed:

lib1 Library name from the row of the slot table in the optical configuration database.

st1 Slot name from the row in the slot table in the optical configuration database.

vol1 Volume serial number of the volume that should be at orientation 0 in slot *st1* in library *lib1*.

vol2 Volume serial number of the volume that should be at orientation 1 in slot *st1* in library *lib1*.

vol3 Volume serial number from the row in the Volume Table.

lib2 Library that should contain *vol3.*

st2 Name of the slot in library *lib2* that should contain volume *vol3*.

o Orientation of volume *vol3* in slot *st2* in library *lib2*.

vol4 Volume serial number of the volume on the opposite side of the optical disk media containing volume *vol3*.

errors Reasons why the slot table is inconsistent with the Volume Table:

1. Slot indicates that volume *vol1* resides in library *lib1* in slot *st1* at orientation 0, but there is no row in the Volume Table for volume *vol1*. This error may be the result of a previously detected error in the definition of volume *vol1*, as indicated by message CBR0181I or message CBR0182I.
2. Slot indicates that volume *vol1* resides in library *lib1* in slot *st1* at orientation 0, but the library name *lib2* associated with volume *vol1* in the volume table does not match the library name *lib1* in the slot table.
3. Slot indicates that volume *vol1* resides in library *lib1* in slot *st1* at orientation 0, but the slot name *st2* associated with volume *vol1* in the volume table does not match the slot name *st1* in the slot table.
4. Slot indicates that volume *vol1* resides in library *lib1* in slot *st1* at orientation 0, but the orientation *o* associated with volume *vol1* in the volume table indicates it resides in orientation 1.
5. Slot indicates that volume *vol2* resides in library *lib1* in slot *st1* at orientation 1, but there is no row in the Volume Table for volume *vol2*. This error may be the result of a previously detected error in the definition of volume *vol2*, as indicated by message CBR0181I or message CBR0182I.

6. Slot indicates that volume *vol2* resides in library *lib1* in slot *st1* at orientation 1, but the library name *lib2* associated with volume *vol2* in the volume table does not match the library name *lib1* in the slot table.
7. Slot indicates that volume *vol2* resides in library *lib1* in slot *st1* at orientation 1, but the slot name *st2* associated with volume *vol2* in the volume table does not match the slot name *st1* in the slot table.
8. Slot indicates that volume *vol2* resides in library *lib1* in slot *st1* at orientation 1, but the orientation *0* associated with volume *vol2* in the volume table indicates it resides in orientation 0.
9. Volume table indicates that volume *vol3* resides in library *lib2* in slot *st2* However, the entry in the slot table for the same slot in the same library indicates that the slot is not occupied.
10. Volume table indicates that volume *vol3* resides in library *lib2* in slot *st2* in orientation 0. However, the entry in the slot table for the specified slot in the specified library indicates that the volume at orientation 0 is *vol1*, which is different than volume *vol3*.
11. Volume table indicates that volume *vol3* resides in library *lib2* in slot *st2* in orientation 1. However, the entry in the slot table for the specified slot in the specified library indicates that the volume at orientation 1 is *vol2*, which is different than volume *vol3*.
12. Volume table indicates that volume *vol3* resides in library *lib2* in slot *st2* in orientation 0 and that the volume on the other side of the cartridge is *vol4*. However, the entry in the slot table for the specified slot in the specified library indicates that the volume at orientation 1 is *vol2*, which is different than volume *vol4*.
13. Volume table indicates that volume *vol3* resides in library *lib2* in slot *st2* in orientation 1 and that the volume on the other side of the cartridge is *vol4*. However, the entry in the slot table for the specified slot in the specified library indicates that the volume at orientation 0 is *vol1*, which is different than volume *vol4*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Make the appropriate corrections in the slot table and/or the Volume Table in the DB2 optical configuration database using SPUFI.

CBR0195I Volume table inconsistent.

Explanation:

```
------ VOLUME TABLE ------------------------------------
VOL0   VOL1   LIBRARY  SLOT  PLIBRARY   XCF MEMBER NAME
vol1   vol2   lib1     st1   plib1      xcf-member-1
------ VOLUME TABLE ------------------------------------
VOL0   VOL1   LIBRARY  SLOT  PLIBRARY   XCF MEMBER NAME
vol3   vol4   lib2     st2   plib2      xcf-member-2
REASONS:  reasons
END OF DISPLAY
```

The information in the volume table for one optical volume is inconsistent with information in the volume table for another optical volume. This message contains selected information from the Volume Table for the two optical volumes. The following fields are displayed:

vol1 Volume serial number of the optical volume.

vol2 Volume serial number of the optical volume that should be on the opposite side of *vol1*.

lib1 Library name of the library that contains optical volume *vol1*.

st1 Slot name of the slot that contains optical volume *vol1*.

plib1 Pseudo library for *vol1* when it is ejected from a 3995 optical library and shelf resident.

xcf-member-1 The XCF member name of the instance of OAM that currently manages and controls *vol1*.

vol3 Volume serial number of the optical volume that should be on the opposite side of *vol1*. This volume serial number should be the same as *vol2*.

vol4 Volume serial number of the optical volume that should be on the opposite side of *vol3*. This volume serial number should be the same as *vol1*.

lib2 Library name of the library that contains optical volume *vol3*. This library name should be the same as *lib1*.

st2 Slot name of the slot that contains optical volume *vol3*. This slot name should be the same as *st1*.

plib2 Pseudo library for *vol3* when it is ejected from a 3995 optical library and shelf resident. This pseudo library name sould be the same as *plib1*.

xcf-member-1 The XCF member name of the instance of OAM that currently manages and controls *vol3*. This XCF member name should be the same as *xcf-member-1*.

reasons Reasons why the volume table is inconsistent:

- 1- Volume table indicates that optical volume *vol1* resides in library *lib1* in slot *st1*. The opposite side volume is *vol2*. However, there is no row in the Volume Table for optical volume *vol2*.
- 2 - Volume table indicates that optical volume *vol1* resides in library *lib1* in slot *st1*. The opposite side volume is *vol2*. However, the row in the Volume Table for optical volume *vol2* indicates that the opposite side of optical volume *vol2* is *vol4*, which is different from *vol1*.
- 3- Volume table indicates that optical volume *vol1* resides in library *lib1* in slot *st1*. The opposite side volume is *vol2*. However, the row in the Volume Table for optical volume *vol2* indicates that volume *vol2*

resides in library *lib2*, which is different from *lib1*.

- 4 - Volume table indicates that optical volume *vol1* resides in library *lib1* in slot *st1*. The opposite side volume is *vol2*. However, the row in the Volume Table for optical volume *vol2* indicates that volume *vol2* resides in slot *st2*, which is different from *st1*.
- 14 - Volume table indicates that optical volume *vol1* resides in pseudo library *plib* as its designated pseudo library when it is shelf resident. The opposite side volume, *vol3* indicates its pseudo library is *plib2*, which is different from *plib1*.
- 15 - Volume table indicates that optical volume *vol1* is currently being managed and controlled by OAM member *xcf-member-1*. The opposite side volume, *vol3* indicates it is currently being managed and controlled by OAM member *xcf-member-2*, which is different from *xcf-member-1*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: Make the appropriate corrections in the Volume Table in the DB2 optical configuration database using SPUFI.

CBR0200I Unable to access TAPEVOL table. Return code = *return-code***, Reason code =** *reason-code***, SQL code =** *SQL-code***, CAF error code =** *CAF-error-code***.**

Explanation: OAM encountered an error while attempting to access the tape volume table (TAPEVOL) in the optical configuration database. The return code and reason code from the optical configuration database access module are *return-code* and *reason-code* respectively. This return and reason code pair is internal information that is included in this message for diagnostic purposes only. The SQL code is *SQL-code*. The Call Attachment Facility (CAF) error code is *CAF-error-code*.

Source: Object access method (OAM)

System Action: OAM initialization stops.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*.

CBR0201I Error updating row in TAPEVOL table for tape volume *volser***. Return code =** *return-code***, Reason code =** *reason-code***, SQL code =** *SQL-code***, CAF error code =** *CAF-error-code***, CAF reason code =** *CAF-reason-code***.**

Explanation: OAM attempted to update the row in the tape volume (TAPEVOL) table in the optical configuration database for tape volume *volser*. The update failed. The return code and reason code from the optical configuration database access module are *return-code* and *reason-code* respectively. This return and reason code pair is internal information that is included in this message for diagnostic purposes only. The SQL code is *SQL-code*. The Call Attachment Facility (CAF) error code is *CAF-error-code*. The Call Attachment Facility (CAF) reason code is *CAF-reason-code*.

Source: Object access method (OAM)

System Action: OAM initialization processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: For information on SQL and CAF error codes see *DB2 Messages and Codes*.

CBR0202I Invalid tape unit name *unit-name* **associated with tape volume** *volser***.**

Explanation: The tape unit name column (UNITNAME) in the row in the tape volume (TAPEVOL) table in the optical configuration database for volume *volser* contains an invalid value.

Source: Object access method (OAM)

System Action: OAM initialization continues. The tape volume table row is skipped. Until the TAPEVOL table row is changed to contain a valid value in the tape unit name column for volume *volser*, and OAM is stopped then started to recognize that new valid value, no work which requires the skipped volume will be done. The requests will fail with a return/reason code pair which indicates that OAM does not know about the volume which was skipped during initialization.

Operator Response: Notify the system programmer.

System Programmer Response: Using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive), correct the tape unit name column (UNITNAME) in the row in the tape volume table in the optical configuration database. When the row contains a valid value, stop and then start OAM so that OAM will recognize the changed unit name column. Recognition of the valid unit name will add the volume to OAM's inventory such that requests for the volume will be able to be processed again.

CBR0203I Invalid capacity *capacity* **associated with tape volume** *volser***.**

Explanation: The capacity *capacity* column (CAPACITY) in the row in the tape volume (TAPEVOL) table in the optical configuration database for volume *volser* contains an invalid value. The volume capacity column (CAPACITY) should not contain a negative value. This column should contain the approximate capacity (in kilobytes) of one of the following:

- a standard capacity IBM cartridge system tape written in 18 track format on a 3480 or 3490 tape drive
- a standard capacity IBM cartridge system tape written in 36 track format on a 3490E tape drive
- an enhanced capacity IBM cartridge system tape written in 36 track format on a 3490E tape drive
- a high performance cartridge tape written in 128 track format on a 3590 Model B tape drive.
- an extended high performance cartridge tape written in 128 track format on a 3590 Model B tape drive.
- a high performance cartridge tape written in 256 track format on a 3590 Model E tape drive.
- an extended high performance cartridge tape written in 256 track format on a 3590 Model E tape drive.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the volume capacity column (CAPACITY) for this tape volume *volser* in the Optical Configuration Data Base was incorrect. To allow OAM initialization to continue, OAM updated the Optical Configuration Data Base TAPEVOL table row for this tape volume to set the volume writable status column (WRITABLE) to 'N' signifying that no more data can be written to this tape.

All requests for this volume, which are **not** write requests, will continue to be processed by OAM. However, until the TAPEVOL table row is changed to contain a valid value in the volume capacity column, the WRITABLE column is set back to 'Y', and OAM is stopped then started to recognize the new values, no more data can be written to this volume. Attempts to write data to this volume will fail with a return/reason code pair which indicates that the volume is not writeable.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0204I Invalid percentage full *percent-full* **associated with tape volume** *volser***.**

Explanation: The percent full column (PFULL) in the row in the tape volume (TAPEVOL) table in the optical configuration database for volume *volser* contains an invalid value. The percent full column (PFULL) should not be less than zero nor greater than 100.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the percent full column (PFULL) for this tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM updated the optical configuration database TAPEVOL table row for this tape volume to set the volume writable status column (WRITABLE) to 'N' signifying that no more data can be written to this tape.

All requests for this volume, which are **not** write requests, will continue to be processed by OAM. However, until the TAPEVOL table row is changed to contain a valid value in the percent full column, the WRITABLE column is set back to 'Y', and OAM is stopped then started to recognize the new values, no more data can be written to this volume. Attempts to write data to this volume will fail with a return/reason code pair which indicates that the volume is not writeable.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0205I Invalid number of logical blocks written *number-logical-blocks* **associated with tape volume** *volser***.**

Explanation: The number of logical blocks written column (NUMLBLKS) in the row in the tape volume (TAPEVOL) table in the optical configuration database for tape volume *volser* contains an invalid value. The number of logical blocks written column (NUMLBLKS) should not be negative.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the number of logical blocks written column (NUMLBLKS) for this tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM updated the optical configuration database TAPEVOL table row for this tape volume to set the volume writable status column (WRITABLE) to 'N' signifying that no more data can be written to this tape.

All requests for this volume, which are **not** write requests, will continue to be processed by OAM. However, until the TAPEVOL table row is changed to contain a valid value in the number of logical blocks written column, the WRITABLE column is set back to 'Y', and OAM is stopped then started to recognize the new values, no more data can be written to this volume. Attempts to write data to this volume will fail with a return/reason code pair which indicates that the volume is not writeable.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0206I Invalid number of logical kilobytes of data written *number-logical-kilobytes* **associated with tape volume** *volser***.**

Explanation: The number of logical kilobytes of data written column (NUMLKBW) in the row in the tape volume (TAPEVOL) table in the optical configuration database for volume *volser* contains an invalid value. The number of logical kilobytes of data written column (NUMLKBW) should not be negative.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the number of logical kilobytes of data written column (NUMLKBW) for this tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM updated the optical configuration database TAPEVOL table row for this tape volume to set the volume writable status column (WRITABLE) to 'N' signifying that no more data can be written to this tape.

All requests for this volume, which are **not** write requests, will continue to be processed by OAM. However, until the TAPEVOL table row is changed to contain a valid value in the number of logical kilobytes of data written column, the WRITABLE column is set back to 'Y', and OAM is stopped then started to recognize the new values, no more data can be written to this volume. Attempts to write data to this volume will fail with a return/reason code pair which indicates that the volume is not writeable.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0207I Invalid number of physical kilobytes of data written *number-physical-kilobytes* **associated with tape volume** *volser***.**

Explanation: The number of physical kilobytes of data written column (NUMPKBW) in the row in the tape volume (TAPEVOL) table in the optical configuration database for volume *volser* contains an invalid value. The number of physical kilobytes of data written column (NUMPKBW) should not be negative.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the number of physical kilobytes of data written column (NUMPKBW) for this tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM updated the optical configuration database TAPEVOL table row for this tape volume to set the volume writable status column (WRITABLE) to 'N' signifying that no more data can be written to this tape.

All requests for this volume, which are **not** write requests, will continue to be processed by OAM. However, until the TAPEVOL table row is changed to contain a valid value in the number of physical kilobytes of data written column, the WRITABLE column is set back to 'Y', and OAM is stopped then started to recognize the new values, no more data can be written to this volume. Attempts to write data to this volume will fail with a return/reason code pair which indicates that the volume is not writeable.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0208I Invalid inuse value of *in-use* **associated with tape volume** *volser***.**

Explanation: The volume in use column (INUSE) in the row in the tape volume (TAPEVOL) table in the optical configuration database for tape volume *volser* contains an invalid value. The INUSE column should only contain a 'Y' when OAM is fully initialized, and processing requests for this tape volume *volser*.

Value	Meaning
Y	The volume is in use by an OAM process.
N	The volume is not in use by an OAM process.

Source: Object access method (OAM)

System Action: OAM sets this value to 'N' to indicate that the tape volume is **not** in use by an OAM process, and OAM initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0209I Invalid copied value of *copied* **associated with tape volume** *volser***.**

Explanation: The tape volume copied column (COPIED) in the row in the tape volume (TAPEVOL) table in the optical configuration database for volume *volser* contains an invalid value. The valid values are:

Value	Meaning
Y	The volume has been copied to an alternate volume.
N	The volume has not been copied to an alternate volume.

Source: Object access method (OAM)

System Action: If the alternate volser column (AVOLSER) for this tape volume is all blanks, indicating that there is no alternate volume serial number for this tape, then OAM sets this value to 'N' to indicate that the tape volume has **not** been copied.

If the alternate volser column (AVOLSER) for this tape volume is not all blanks, indicating that there is an alternate volume serial number for this tape, then OAM sets this value to 'Y' to indicate that the tape volume **has** been copied.

In either case, OAM initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0210I Unknown storage group name *storage-group-name* **specified for tape volume** *volser* **in the TAPEVOL table.**

Explanation: One of the following statements is true for the storage group *storage-group-name* specified for volume *volser*:

- The storage group is not defined in the SMS ACDS.
- The storage group definition in the SMS ACDS contained errors.
- The storage group is defined in the SMS ACDS, however it is enabled to more than one system in a sysplex, and this instance of OAM does not belong to an OAMPLEX; therefore, any object storage groups enabled to more than one system are ignored.

Source: Object access method (OAM)

System Action: OAM initialization continues. The tape volume table row is skipped. Until the active SMS configuration is changed to contain a valid OBJECT or OBJECT BACKUP storage group definition, and OAM is restarted to recognize that new valid definition, no work which requires the skipped volume will be done. The requests will fail with a return/reason code pair which indicates that OAM does not know about the volume which was skipped during initialization.

Operator Response: Notify the system programmer.

System Programmer Response: If the storage group name in the tape volume (TAPEVOL) table is in error, correct the storage group name using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive). When the row contains a valid value, stop and then start OAM so that OAM will recognize the changed storage group name. Recognition of the valid storage group name will add the volume to OAM's inventory such that requests for the volume will be processed again.

If the storage group definition is missing from the active SMS configuration, add the definition using the ISMF Storage Administrator OBJECT storage group or OBJECT BACKUP storage group define panel.

If the storage group definition is in error, follow the instructions for the message describing that error.

CBR0211I Invalid number of logical kilobytes of data deleted *number-logical-kilobytes* **associated with tape volume** *volser***.**

Explanation: The number of logical kilobytes of data deleted column (NUMLKBDE) in the row in the tape volume (TAPEVOL) table in the optical configuration database for volume *volser* contains an invalid value. The number of logical kilobytes of data deleted column (NUMLKBDE) should not be negative.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the number of logical kilobytes of data deleted column (NUMLKBDE) for this tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM updated the optical configuration database TAPEVOL table row for this tape volume to set the volume writable status column (WRITABLE) to 'N' signifying that no more data can be written to this tape.

All requests for this volume, which are **not** write requests, will continue to be processed by OAM. However, until the TAPEVOL table row is changed to contain a valid value in the number of logical kilobytes of data deleted column, the WRITABLE column is set back to 'Y', and OAM is stopped then started to recognize the new values, no more data can be written to this volume. Attempts to write data to this volume will fail with a return/reason code pair which indicates that the volume is not writeable.

Operator Response: Notify the system programmer.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix to the problem. If no fix exists, contact the IBM Support Center.

CBR0212I Invalid volume compaction status *compaction-status* **associated with tape volume** *volser***.**

Explanation: During OAM initialization and configuration validation, OAM discovered that the volume compaction status column (COMPACT) in the row in the tape volume table (TAPEVOL) in the optical configuration database for volume *volser* contains an invalid value. The valid values are:

Value	Meaning
Y	The tape volume contains compacted data.
N	The tape volume contains uncompacted data.

Source: Object access method (OAM)

System Action: During initialization, OAM discovered that the volume compaction status column (COMPACT) for this tape volume *volser* in the optical configuration database was incorrect. To allow OAM initialization to continue, OAM updated the optical configuration database TAPEVOL table row for this tape volume to set the volume writable status column (WRITABLE) to 'N' signifying that no more data can be written to this tape.

All requests for this volume, which are **not** write requests, will continue to be processed by OAM. However, until the TAPEVOL table row is changed to contain a valid value in the volume compaction column, the WRITABLE column is set back to 'Y', and OAM is stopped then started to recognize the new values, no more data can be written to this volume. Attempts to write data to this volume will fail with a return/reason code pair which indicates that the volume is not writeable.

Operator Response: Notify the system programmer.

System Programmer Response: Using SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive), correct the volume compaction status column (COMPACT) in the row in the tape volume table in the optical configuration database. When the row contains a valid value, stop and then start OAM so that OAM will recognize the changed volume compaction status column. Recognition of the valid volume compaction status will add the volume to OAM's inventory such that requests for the volume will be processed again.

CBR0220D Unable to update *table-name* **table due to DB2 error. Reply 'R' to retry or 'I' to ignore the error.**

Explanation: An error occurred attempting to update the *table-name* table in the optical configuration database. During OAM processing, one or more rows of *table-name* have been changed and can not be updated in the optical configuration database. These updates will be lost if OAM termination continues with the 'I' reply.

Source: Object access method (OAM)

System Action: OAM processing waits for a response from the operator.

Operator Response: If OAM should retry update processing for the failed updates, reply 'R' to this message. Contact the Data Base Administrator to ensure DB2 is functioning correctly before a reply of 'I' or an activation of a new control data set (CDS).

If OAM should continue its termination processing and ignore the errors, reply 'I' to this message. OAM termination continues. Updates to the optical configuration database are lost. Manual updates to the optical configuration database may be required in order to complete a subsequent OAM initialization.

Reply 'I' will suppress message CBR0220D. Other messages such as CBR7520I, CBR7521I, CBR7522I, CBR7523I, CBR7525A, CBR7575I and CBR7585I are not affected and will be issued as required.

CBR0300I TAPEUNITNAME *unit-name* **contains invalid device types.**

Explanation: OAM is processing the SETOAM commands in the CBROAMxx member of PARMLIB. The TAPEUNITNAME keyword was specified on the SETOAM command with an esoteric unit name. At least one tape drive contained in esoteric unit name *unit-name* has a device type other than the devices supported by OAM.

Device types supported by OAM are as follows:

- 3480 - an IBM base 3480 device
- 3480X - an IBM 3480 device with the IDRC feature, or an IBM base 3490 device
- 3490 - an IBM 3490E device
- 3590-1 - an IBM 3590 device

Source: Object access method (OAM)

System Action: OAM continues processing all of the SETOAM commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the SETOAM commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Make sure that the esoteric unit name specified in the TAPEUNITNAME keyword on the SETOAM command contains only tape drives whose device types are supported by OAM.

CBR0301I TAPEUNITNAME *unit-name* **not found.**

Explanation: OAM is processing the SETOAM commands in the CBROAMxx member of PARMLIB. The TAPEUNITNAME keyword was specified on the SETOAM command with an esoteric unit name. Esoteric unit name *unit-name* could not be located by the MVS unit name verification service.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the SETOAM commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Make sure that the unit name specified in the TAPEUNITNAME keyword on the SETOAM command is defined to the MVS/ESA operating system. Correct the esoteric unit name specified with the TAPEUNITNAME keyword on the SETOAM command in the CBROAMxx member of PARMLIB.

CBR0302I Keyword *keyword-name* **invalid in a {SETOAM|SETOPT|OAMXCF} statement.**

Explanation: OAM is processing the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, or OAM is processing the OAMXCF commands in the CBROAMxx member of PARMLIB. An unrecognized keyword was specified on a SETOAM, SETOPT, or OAMXCF command. This error is caused by one of the following reasons:

- *keyword-name* is not a valid keyword.
- There is a blank between *keyword-name* and the left parenthesis that should immediately follow it.
- A keyword which is storage group specific has been specified at the global level.
- A keyword which is global only has been specified at the storage group level.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, or all the OAMXCF commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the commands it is cur-

rently parsing in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Correct the spelling of the keyword on the SETOAM, SETOPT, or OAMXCF command in the CBROAMxx member of PARMLIB or remove the blank between keyword name and the left parenthesis that should immediately follow it.

CBR0303I Data for keyword *keyword-name* **in a {SETOAM|SETOPT|OAMXCF} statement is invalid -** *data***.**

Explanation: OAM is processing the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, or OAM is processing the OAMXCF commands in the CBROAMxx member of PARMLIB. A keyword was specified on a SETOAM, OAMXCF, or RSETOPT command and the data supplied with the keyword is invalid. This error is caused by one of the following reasons:

- *data* has invalid syntax (for example, it should be numeric and instead alphabetic characters have been entered)
- *data* has invalid range (for example, it should be between 1 and 100 and 1000 has been entered)
- *data* is not followed by a right parenthesis

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, or all the OAMXCF commands in the CBROAMxx member of the PARMLIB, but OAM initialization will terminate after all the commands it is currently parsing in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Correct the invalid data supplied with the keyword on the SETOAM, SETOPT, or OAMXCF command in the CBROAMxx member of PARMLIB. Verify that the data supplied with the keyword:

- is of the correct syntax (numeric or alphabetic)
- is in the acceptable numerical range for the keyword specified
- is followed by a right parenthesis.

CBR0304I Extra data for keyword *keyword-name* **in a {SETOAM|SETOPT|OAMXCF} statement has been found -** *data***.**

Explanation: OAM is processing the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, or OAM is processing the OAMXCF commands in the CBROAMxx member of PARMLIB. The data supplied for *keyword-name* has an embedded blank.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, or all the OAMXCF commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the commands it is currently parsing in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Correct the data supplied with keyword *keyword-name* on the SETOAM, SETOPT, or OAMXCF command in the CBROAMxx member of PARMLIB. Make sure that the data between the left and right parentheses following the keyword contains no embedded blanks.

CBR0305I STORAGEGROUP *storage-group-name* **missing ending parenthesis in a {SETOAM|SETOPT} statement.**

Explanation: OAM is processing the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB. The STORAGEGROUP keyword was specified on a SETOAM or SETOPT command. The data for *storage-group-name* does not end with a right parenthesis.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Correct the SETOAM or SETOPT command in the CBROAMxx member of PARMLIB by adding an ending right parenthesis following all of the keywords associated with the STORAGEGROUP keyword.

CBR0306I Data for keyword *keyword-name* **is missing in a {SETOAM|SETOPT|OAMXCF} statement.**

Explanation: OAM is processing the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, or OAM is processing the OAMXCF commands in the CBROAMxx member of PARMLIB. The keyword *keyword-name* was specified on a SETOAM, SETOPT, or OAMXCF command, but no data was supplied with the keyword. This error is caused by one of the following conditions:

- There is no data between the left and right parentheses that follow the keyword *keyword-name*.
- The left parenthesis following keyword *keyword-name* is the last character in the CBROAMxx member of PARMLIB.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, or all the OAMXCF commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the commands it is currently parsing in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Correct the SETOAM, SETOPT, or OAMXCF command in the CBROAMxx member of PARMLIB by adding the appropriate data following the keyword *keyword-name*.

CBR0307I STORAGEGROUP *storage-group-name* **specified in a {SETOAM|SETOPT} statement not found.**

Explanation: OAM is processing the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB. The STORAGEGROUP keyword was specified on a SETOAM or SETOPT command, followed by a storage group name. The storage group name specified *storage-group-name* is not the name of an OBJECT or OBJECT BACKUP storage group defined in the active SMS configuration.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the SETOAM and SETOPT commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Verify that the storage group name specified with the STORAGEGROUP keyword on the SETOAM or SETOPT command is spelled correctly. If the storage

group name is spelled correctly, use the Interactive Storage Management Facility (ISMF) storage group application to verify that the storage group is part of the active SMS configuration. If the storage group name is spelled correctly AND the storage group is not the name of an OBJECT or OBJECT BACKUP storage group in the active SMS configuration, then activate an SMS configuration containing a definition of this storage group and restart the OAM address space.

CBR0308I TAPEUNITNAME *unit-name* contains conflicting tape device types.

Explanation: OAM is processing the SETOAM commands in the CBROAMxx member of PARMLIB. The TAPEUNITNAME keyword was specified on the SETOAM command with an esoteric unit name. The tape drives associated with esoteric unit name *unit-name* include tape drive types with more than one recording technology.

Source: Object access method (OAM)

System Action: OAM continues processing all of the SETOAM commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all of the SETOAM commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: If an esoteric unit name is specified with the TAPEUNITNAME keyword on the SETOAM command, all the tape drives associated with the esoteric unit name must support the same recording technology. Update the definition of the esoteric unit name to include only tape drives that support the same recording technology or specify a different esoteric unit name with the TAPEUNITNAME keyword on the SETOAM command.

CBR0309I PARMLIB member *member* is empty.

Explanation: OAM is processing the *member* member of PARMLIB because the OAM=xx keyword was specified on the PARM field of the JCL EXEC statement in the cataloged procedure used to start the OAM address space. There are no SETOAM or SETOPT commands in the *member* member of PARMLIB.

Source: Object access method (OAM)

System Action: OAM initialization continues. Since no SETOAM commands were included in *member* to associate tape related parameters with any OBJECT or OBJECT BACKUP storage group, OAM will not store any OAM objects to tape and will not store the backup copies of any OAM objects to tape. In addition, since there were no SETOPT commands included in *member*, OAM will use default values when processing objects stored on optical media.

System Programmer Response: If object tape processing is required then add the appropriate SETOAM commands to the *member* member of PARMLIB. Add SETOPT commands to the *member* member of PARMLIB to set up various preferences for optical volume processing. Refer to *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support* for information on SETOAM and SETOPT commands. OAM must be restarted to recognize any changes made to the *member* member of PARMLIB.

CBR0310I PARMLIB member *member* contains no SETOAM commands.

Explanation: OAM is processing the *member* member of PARMLIB. There are no SETOAM commands in the *member* of PARMLIB.

Source: Object access method (OAM)

System Action: OAM initialization continues. Since no SETOAM commands were included in *member* to associate tape related parameters with any OBJECT or OBJECT BACKUP storage group, OAM will not store any OAM objects to tape and will not store the backup copies of any OAM objects to tape.

System Programmer Response: If object tape processing is required then add the appropriate SETOAM commands to the *member* member of PARMLIB. Refer to *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support* for information on the SETOAM command. OAM must be restarted to recognize any changes made to the *member* member of PARMLIB.

CBR0311I A TAPEUNITNAME subparameter has not been specified, or is invalid, for STORAGEGROUP *storage-group-name*.

Explanation: OAM is processing the SETOAM commands in the CBROAMxx member of PARMLIB. No tape unit name has been specified, via the TAPEUNITNAME keyword on the SETOAM command, for storage group *storage-group-name* or a tape unit name was specified but the tape unit name was invalid. A valid tape unit name must be associated with an OBJECT or OBJECT BACKUP storage group, if objects belonging to that storage group are going to be stored on tape media.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the SETOAM commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Add a TAPEUNITNAME subparameter to the STORAGEGROUP parameter on the SETOAM command in the CBROAMxx member of PARMLIB or make sure that the tape unit name specified with the TAPEUNITNAME subparameter is a valid tape unit name defined to the MVS operating system.

CBR0312I PARMLIB member *member* contains no valid STORAGEGROUP parameters for the SETOAM command.

Explanation: OAM is processing the SETOAM commands in the CBROAMxx member of PARMLIB. There is no SETOAM command in the CBROAMxx member of PARMLIB that contains the STORAGEGROUP keyword with tape related parameters. Because there are no tape related parameters associated with any OBJECT or OBJECT BACKUP storage group, OAM will not store any OAM objects to tape and will not store the backup copies of any OAM objects to tape.

Source: Object access method (OAM)

System Action: OAM processing continues with no effect on initialization.

System Programmer Response: Verify that there is at least one SETOAM command with the STORAGEGROUP keyword specified in the *member* member of PARMLIB. Verify that the STORAGEGROUP keyword is not misspelled on any of the existing SETOAM commands in the PARMLIB member.

CBR0313I STORAGEGROUP *storage-group-name* MAXTAPERETRIEVETASKS value (*stgp-task-number*) is greater than SETOAM MAXTAPERETRIEVETASKS value (*setoam-task-number*).

Explanation: OAM is processing the SETOAM commands in the CBROAMxx member of PARMLIB. The value specified with the MAXTAPERETRIEVETASKS keyword for storage group *storage-group-name* is greater than the SETOAM MAXTAPERETRIEVETASKS value.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the SETOAM commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Specify a value with the MAXTAPERETRIEVETASKS keyword, associated with storage group *storage-group-name* that is less than or equal to the SETOAM MAXTAPERETRIEVETASKS value.

CBR0314I STORAGEGROUP *storage-group-name* **MAXTAPESTORETASKS value (***stgp-task-number***) is greater than SETOAM MAXTAPESTORETASKS value (***setoam-task-number***).**

Explanation: OAM is processing the SETOAM commands in the CBROAMxx member of PARMLIB. The value specified with the MAXTAPESTORETASKS keyword, for storage group *storage-group-name*, is greater than the SETOAM MAXTAPESTORETASKS value.

Source: Object access method (OAM)

System Action: OAM continues processing all the SETOAM commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the SETOAM commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Specify a value with the MAXTAPESTORETASKS keyword, for storage group *storage-group-name*, that is less than or equal to the SETOAM MAXTAPESTORETASKS value.

CBR0315I STORAGEGROUP *storage-group-name* **TAPECOMPACTION parameter ignored. TAPEUNITNAME** *tape-unit-name* **contains 3480 tape drives without the IDRC feature.**

Explanation: OAM is processing the SETOAM commands in the CBROAMxx member of PARMLIB. A SETOAM command was specified for storage group *storage-group-name*. Both the TAPECOMPACTION keyword and the TAPEUNITNAME keyword were specified on the SETOAM command. However, the esoteric tape unit name specified with the TAPEUNITNAME keyword contains at least one 3480 tape drive without the Improved Data Recording Capability (IDRC) hardware feature. Because of this the TAPECOMPACTION keyword is changed to NOTAPECOMPACTION.

Source: Object access method (OAM)

System Action: OAM processing continues with no effect on initialization. Any OAM objects belonging to the specified storage group that are going to be written to tape, will be written in uncompacted format using a tape drive belonging to the esoteric tape unit name.

System Programmer Response: Correct the SETOAM command in the CBROAMxx member of PARMLIB. Change the TAPECOMPACTION keyword, on the SETOAM command for storage group *storage-group-name* to NOTAPECOMPACTION, or choose a different esoteric tape unit name that consists of tape drives that all have the Improved Data Recording Capability (IDRC) hardware feature.

CBR0316I The {global|storage group} DATACLASS *dataclass-name* **is invalid.**

Explanation: OAM was processing SETOAM commands in the CBROAMxx PARMLIB member. Either the dataclass specified on a SETOAM command *dataclass-name* is not the name of a dataclass defined in the active SMS configuration or the dataclass defined in the active SMS configuration contains media interchange values that are up-level and not supported by the OAM software level on this system.

Source: Object access method (OAM)

System Action: The following action will take place, based on the type of DATACLASS specification:

- Global level specification:
  - The global level dataclass will retain its previous value, or there will be no global dataclass value.
- Storage Group specification:
  - If the storage group was previously assigned a dataclass, it will retain its previous value.
  - If the storage group was not assigned a dataclass, it will be assigned the global dataclass name or blanks if no global dataclass name exists.

OAM continues processing.

System Programmer Response: Use ISMF to make sure that DATACLASS *dataclass-name* is defined in the active SMS configuration and that the dataclass specified on the SETOAM command is supported by this level of OAM software.

CBR0317I The {global|storage group} TAPEEXPIRATION *expiration-date* **is earlier than current date.**

Explanation: OAM was processing SETOAM commands in the CBROAMxx PARMLIB member. Either the global or storage group specific TAPEEXPIRATION *expiration-date* is a date that precedes the current system date.

Source: Object access method (OAM)

System Action: OAM initialization continues. The expiration date set in the JFCB for tapes used for OAM objects will be a date considered to have been previously expired.

System Programmer Response: Verify the date that should be set for the global or storage group tape expiration date, and change this value in the SETOAM command in the CBROAMxx PARMLIB member that is being used.

CBR0318I The {global|storage group} TAPEFULLTHRESHOLD *full-threshold* **is out of range, a default of zero will be used.**

Explanation: OAM was processing SETOAM commands in the CBROAMxx PARMLIB member. Either the global or storage group specific TAPEFULLTHRESHOLD *full-threshold* is out of the valid parameter range (0-999999).

Source: Object access method (OAM)

System Action: OAM initialization continues. OAM will use a default value of zero for this parameter.

System Programmer Response: Verify the value that is desired for the global or storage group tape full threshold, and change this value in the SETOAM command in the CBROAMxx PARMLIB member that is being used.

CBR0319I SETOAM command encountered in PARMLIB member *member* with no keywords.

Explanation: OAM is processing the SETOAM commands in the *member* member of PARMLIB. A SETOAM command was encountered with no keywords specified.

Source: Object access method (OAM)

System Action: OAM initialization continues. The SETOAM command is ignored.

System Programmer Response: Verify the syntax of the SETOAM command in the *member* member of PARMLIB. Refer to *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support* for syntax information on the SETOAM command. OAM must be restarted to recognize any changes made to the *member* member of PARMLIB.

CBR0320I PARMLIB member *member* contains no SETOPT commands.

Explanation: OAM is processing the *member* member of PARMLIB. There are no SETOPT commands in the PARMLIB member.

Source: Object access method (OAM)

System Action: OAM initialization continues using default values for optical processing.

System Programmer Response: Various optical processing preferences can be specified to OAM via the SETOPT command in the CBROAMxx member of PARMLIB. Currently, *member* contains no SETOPT commands, therefore OAM is initialized with default values. Add appropriate SETOPT commands to the *member* member of PARMLIB to override the default values if required. Refer to *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support* for information on the SETOPT command. OAM must be restarted to recognize any changes made to the *member* member of PARMLIB.

CBR0321I SETOPT command encountered in PARMLIB member *member* with no keywords.

Explanation: OAM is processing the SETOPT commands in the *member* member of PARMLIB. A SETOPT command was encountered with no keywords specified.

Source: Object access method (OAM)

System Action: OAM initialization continues. The SETOPT command is ignored.

System Programmer Response: Verify the syntax of the SETOPT command in the *member* member of PARMLIB. Refer to *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support* for syntax information on the SETOPT command. OAM must be restarted to recognize any changes made to the *member* member of PARMLIB.

CBR0322I Max entries for tape esoteric table exceeded - entry *xxxx* not added

Explanation: There is a maximum of 150 esoteric names that can be in the tape esoteric table. If more than 150 esoteric unit names are specified using SETOAM TAPECAPACITY commands, an entry *entry* was not added.

Source: Object access method (OAM)

System Action: OAM initialization will terminate.

Operator Response: Start OAM after the CBROAMxx parmlib member has been updated to not specify more than 150 different esoteric names via the SETOAM TAPECAPACITY keyword.

CBR0323I TAPECAPACITY specified with invalid capacity *capacity*, TAPECAPACITY for name *unitname* not accepted.

Explanation: The value 2147483646 is the highest number allowed for specification of a TAPECAPACITY. This value represents the kilobytes of data that can be written to the tape volume. A capacity *capacity* that was less than 0 or greater than 2147483646 was specified for name *unitname*.

Source: Object access method (OAM)

System Action: OAM initialization will terminate.

Operator Response: Start OAM after the CBROAMxx parmlib member has been updated to not specify a TAPECAPACITY greater than 2147483646.

CBR0324I TAPECAPACITY specified for 3590 tape device *xxxx*, tape capacity for 3590 tape devices cannot be changed.

Explanation: 3590-1 is not affected by TAPECAPACITY specifications. Device *device* is a 3590-1 device so it's tape capacity cannot be changed.

Source: Object access method (OAM)

System Action: OAM initialization will terminate.

Operator Response: Start OAM after the CBROAMxx parmlib member has been updated to not specify 3590-1 tape devices with the SETOAM TAPECAPACITY keyword.

CBR0325I TAPECAPACITY specified with invalid unitname *unitname*, command not accepted.

Explanation: A SETOAM TAPECAPACITY specification in the CBROAMxx parmlib member has indicated an invalid unitname. The valid unitnames are either CST18, CBS36, ECCST or any valid generic or esoteric unitname that represents these tape technologies.

Source: Object access method (OAM)

System Action: OAM initialization will terminate.

Operator Response: Start OAM after the CBROAMxx parmlib member has been updated to indicate a valid 18-trk, 36-trk or extended capacity tape device unitname, either with the CST18, CST36, ECCST values, or a valid generic or esoteric unitname that represents these tape technologies.

CBR0326I XCFTIMEOUT parameters missing ending parenthesis in a OAMXCF statement.

Explanation: OAM is processing the OAMXCF commands in the CBROAMxx member of PARMLIB. The XCFTIMEOUT keyword was specified on a OAMXCF command. The data for the XCFTIMEOUT keyword does not end with a right parenthesis.

Source: Object access method (OAM)

System Action: OAM continues processing all the OAMXCF commands in the CBROAMxx member of PARMLIB, but OAM initialization will terminate after all the OAMXCF commands in the CBROAMxx member of PARMLIB have been processed.

System Programmer Response: Correct the OAMXCF command in the CBROAMxx member of PARMLIB by adding an ending right parenthesis following all of the keywords associated with the XCFTIMEOUT keyword.

CBR0327I PARMLIB member *member* contains no OAMXCF commands.

Explanation: OAM is processing the *member* member of PARMLIB. There are no OAMXCF commands in the PARMLIB member.

Source: Object access method (OAM)

System Action: OAM initialization continues, checking the configuration for valid non-OAMPLEX environment.

System Programmer Response: Various optical processing preferences can be specified to OAM via the OAMXCF command in the CBROAMxx member of PARMLIB. Currently, *member* contains no OAMXCF commands, therefore OAM is initialized verifying that the configuration is valid for a non-OAMPLEX environment. Add appropriate OAMXCF commands to the *member* member of PARMLIB to run as part of an OAMPLEX, if required. See *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support* for information on the OAMXCF command. OAM must be restarted to recognize any changes made to the *member* member of PARMLIB.

CBR0328I OAMXCF command encountered in PARMLIB member *member* with no keywords.

Explanation: OAM is processing the OAMXCF commands in the *member* member of PARMLIB. A OAMXCF command was encountered with no keywords specified.

Source: Object access method (OAM)

System Action: OAM initialization continues. The OAMXCF command is ignored. OAM initialization verifies the configuration is valid for non-OAMPLEX processing.

System Programmer Response: Verify the syntax of the OAMXCF command in the *member* member of PARMLIB. See *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support* for syntax information on the OAMXCF command. OAM must be restarted to recognize any changes made to the *member* member of PARMLIB.

CBR0329I PARMLIB member *member* contains no valid OAMGROUPNAME parameter for the OAMXCF command.

Explanation: OAM is processing the OAMXCF commands in the CBROAMxx member of PARMLIB. There is no OAMXCF command in the CBROAMxx member of PARMLIB that contains the OAMGROUPNAME keyword. The existence of the OAMXCF command implies that this instance of OAM is supposed to be part of an OAMPLEX, however, without an XCF group name, OAM cannot join an XCF group.

Source: Object access method (OAM)

System Action: OAM initialization fails.

System Programmer Response: Verify that if this instance of OAM is part of an OAMPLEX, the *member* member of PARMLIB must contain a OAMXCF command with a valid OAMGROUPNAME keyword. If this instance of OAM is not part of an OAMPLEX, there should be no OAMXCF commands in *member* of PARMLIB.

CBR0330I PARMLIB member *member* contains no valid OAMMEMBERNAME parameter for the OAMXCF command.

Explanation: OAM is processing the OAMXCF commands in the CBROAMxx member of PARMLIB. There is no OAMXCF command in the CBROAMxx member of PARMLIB that contains the OAMMEMBERNAME keyword. The existence of the OAMXCF command implies that this instance of OAM is supposed to be part of an OAMPLEX, however, without an XCF group name, OAM cannot join an XCF group.

Source: Object access method (OAM)

System Action: OAM initialization fails.

System Programmer Response: Verify that if this instance of OAM is part of an OAMPLEX, the *member* member of PARMLIB must contain a OAMXCF command with a valid OAMMEMBERNAME keyword. If this instance of OAM is not part of an OAMPLEX, there should be no OAMXCF commands in *member* of PARMLIB.

CBR0400I OSREQ {ACCESS | CHANGE | DELETE | QUERY | RETRIEVE | STORE | UNACCESS} successful. Return code = *return-code*, reason code = *reason-code*.

Explanation: The OSREQ request completed successfully with a return code of 0 or an attention return code of 4. Return code = *return-code*, reason code = *reason-code*.

Source: Object access method (OAM)

System Action: The OSREQ function was performed successfully.

CBR0401I OSREQ {ACCESS | CHANGE | DELETE | QUERY | RETRIEVE | STORE | UNACCESS} unsuccessful. Return code = *return-code*, reason code = *reason-code*.

Explanation: The OSREQ request ended in error with a non-zero return code.

Source: Object access method (OAM)

System Action: The OSREQ function did not complete successfully.

Application Programmer Response: Investigate the return code and the reason code in the message using the list of OSREQ return codes and reason codes in *DFSMS/MVS DFSMSdfp Diagnosis Reference*.

CBR0402I Error parsing OSREQ command, return code = *return-code*.

Explanation: An error occurred parsing the OSREQ command. A non-zero return code *return-code* was received from the TSO parse service routine (IKJPARS).

Source: Object access method (OAM)

System Action: The OSREQ command did not complete successfully.

Application Programmer Response: Investigate the return code from the TSO parse service routine (IKJPARS) using the manual *OS/390 TSO/E Programming Services*.

CBR0403I Error {obtaining | releasing} buffer for OSREQ {QUERY | RETRIEVE | STORE | COMPARE} operation, return code = *return-code***.**

Explanation: An error occurred obtaining or releasing a data buffer required in order to perform the requested operation.

Source: Object access method (OAM)

System Action: The OSREQ command did not complete successfully.

Application Programmer Response: For more information on the return code from the STORAGE OBTAIN or STORAGE RELEASE macro, see *OS/390 MVS Programming: Assembler Services Reference*.

CBR0404I OSREQ {ACCESS | CHANGE | DELETE | QUERY | RETRIEVE | STORE | UNACCESS} response time is *milliseconds* **milliseconds.**

Explanation: The OSREQ request ended and the response time is identified in *milliseconds*.

Source: Object access method (OAM)

System Action: None.

CBR0405I OSREQ {RETRIEVE | STORE} data rate is *data-rate* **kilobytes/second.**

Explanation: The OSREQ RETRIEVE or STORE request successfully ended. The data rate *data-rate*, in terms of kilobytes/second, that it took to retrieve or store the object is specified in the message text.

Source: Object access method (OAM)

System Action: None

CBR0406I LENGTH keyword and value required for OSREQ STORE request. No LENGTH specified.

Explanation: The LENGTH keyword and value must be specified for an OSREQ STORE request. The LENGTH keyword was not specified or it was specified but no corresponding value was supplied.

Source: Object access method (OAM)

System Action: Processing of the OSREQ command stops.

Application Programmer Response: Reissue the OSREQ STORE command with the LENGTH keyword and value specified.

CBR0407I Invalid object length *object-length* **specified on OSREQ {RETRIEVE | STORE | COMPARE} request.**

Explanation: The length *object-length* specified with the LENGTH keyword on the OSREQ request is invalid because it is a zero or negative value.

Source: Object access method (OAM)

System Action: Processing of the OSREQ command stops.

Application Programmer Response: Reissue the OSREQ command with the correct length.

CBR0408I Invalid object offset *object-offset* **specified on OSREQ {RETRIEVE | COMPARE} request.**

Explanation: The offset *object-offset* specified with the OFFSET keyword on the OSREQ RETRIEVE or OSREQ COMPARE request is invalid. The offset specified with the OFFSET keyword must not be negative and must not be less than the total length of the object to be retrieved.

Source: Object access method (OAM)

System Action: Processing of the OSREQ command stops.

Application Programmer Response: Reissue the OSREQ command with the correct offset.

CBR0410I Collection name = *col-name*

Explanation: The OSREQ QUERY request was issued and completed successfully. *col-name* is collection name of the object of the QUERY.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0411I Object name = *obj-name*

Explanation: The OSREQ QUERY request was issued and completed successfully. *obj-name* is name of the object of the QUERY.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0412I Object size = *obj-size*

Explanation: The OSREQ QUERY request was issued and completed successfully. *obj-size* is size of the object of the QUERY.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0413I Creation date = *creation-date*

Explanation: The OSREQ QUERY request was issued and completed successfully. *creation-date* is the date the object was created.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0414I Creation timestamp = *creation-time*

Explanation: The OSREQ QUERY request was issued and completed successfully. *creation-time* is the time the object was created.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0415I Last referenced date = *reference-date*

Explanation: The OSREQ QUERY request was issued and completed successfully. *reference-date* is the last date the object was referenced.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0416I Expiration date = *expiration-date*

Explanation: The OSREQ QUERY request was issued and completed successfully. *expiration-date* is the date the object expires in the form YYYY-MM-DD.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0417I Management class = *management-class*

Explanation: The OSREQ QUERY request was issued and completed successfully. *management-class* is the Objects management class.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0418I Storage class = *storage-class*

Explanation: The OSREQ QUERY request was issued and completed successfully. *storage-class* is the objects storage class.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0419I **************

Explanation: The OSREQ QUERY request was issued and completed successfully. This message is a separator line that is issued at the beginning of the data for each OAM object returned by the query request.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0420I Data comparison for object *collection-name object-name* successful.

Explanation: An OSREQ RETRIEVE or OSREQ COMPARE request was issued for the specified object with collection name of *collection-name* and object name of *object-name*.

For an OSREQ RETRIEVE request, the COMPARE keyword was specified. The data contained within the object successfully compares with the pre-defined pattern that was placed in the object when the object was initially stored with the OSREQ TSO command processor.

For an OSREQ COMPARE request, the specified portion of the primary copy of the object matches the backup copy of the object.

Source: Object access method (OAM)

System Action: The OSREQ RETRIEVE or OSREQ COMPARE function completed successfully.

CBR0421I Data comparison for object *collection-name object-name* unsuccessful. Incorrect data starting at offset *decimal-offset* ('*hex-offset*'X).

Explanation: An OSREQ RETRIEVE or OSREQ COMPARE request was issued for the specified object with collection name *collection-name* and object name *object-name*.

For an OSREQ RETRIEVE request, the COMPARE keyword was specified. The data contained within the object does NOT compare with the pre-defined pattern that was placed in the object when the object was initially stored with the OSREQ TSO command processor. The first byte containing incorrect data was found at *decimal-offset* ('*hex-offset*'X).

For an OSREQ COMPARE request, the specified portion of the primary copy of the object does not match the backup copy of the object. The first byte containing non-matching data was found at *decimal-offset* ('*hex-offset*'X).

Source: Object access method (OAM)

System Action: The OSREQ RETRIEVE or OSREQ COMPARE function was unsuccessful.

CBR0422I Data for {primary | backup} copy of object *collection-name object-name* follows.

Explanation: The OSREQ RETRIEVE or OSREQ COMPARE request was issued for the specified object *collection-name object-name*. The DATA keyword was specified on the OSREQ RETRIEVE or OSREQ COMPARE request. The data contained within the object is printed following this message.

Source: Object access method (OAM)

System Action: None.

CBR0423I *oooooooo* = *aaaaaaaa bbbbbbbb cccccccc dddddddd* **AAAA BBBB CCCC DDDD**

Explanation: The OSREQ RETRIEVE or OSREQ COMPARE request was issued for the specified object. The DATA keyword was specified on the OSREQ RETRIEVE or OSREQ COMPARE request. The data contained within the object is displayed in this message.

In the message text:

oooooooo	The offset (in hex) of the data within the object.
aaaaaaaa	The first word (4 bytes) of data in hexadecimal notation.
bbbbbbbb	The second word (4 bytes) of data in hexadecimal notation.
cccccccc	The third word (4 bytes) of data in hexadecimal notation.
dddddddd	The fourth word (4 bytes) of data in hexadecimal notation.
AAAA	The first word (4 bytes) of data in EBCDIC format.
BBBB	The second word (4 bytes) of data in EBCDIC format.
CCCC	The third word (4 bytes) of data in EBCDIC format.
DDDD	The fourth word (4 bytes) of data in EBCDIC format.

Source: Object access method (OAM)

System Action: None.

CBR0424I The following message was received from the OSREQ macro:

Explanation: The OSREQ TSO Command Processor supplied a message area on the OSREQ macro and the OSREQ macro returned a message.

Source: Object access method (OAM)

System Action: none

Application Programmer Response: Evaluate the return and reason codes in the previous CBR0400I or CBR0401I message as

well as the following CBR0425I message to determine the cause of the failure.

CBR0425I *message-received-from-the-OSREQ-macro*

Explanation: The *message-received-from-the-OSREQ-macro* will be issued in 72 byte segments.

Source: Object access method (OAM)

System Action: None.

Application Programmer Response: Evaluate the return and reason codes in the previous CBR0400I or CBR0401I message as well as this message to determine the cause of the failure.

CBR0426I DB2 CAF {CLOSE|OPEN} function issued a return code of *return-code* **and reason code of** *reason-code***.**

Explanation: The OSREQ TSO Command processor was invoked to do an OSREQ STORE or an OSREQ DELETE. The STORE or DELETE completed with a nonzero return code, so the corresponding changes which had been made to the DB2 tables for this task had to be undone. A CAF CLOSE with the ABORT option was issued to cause a DB2 ROLLBACK of the database changes.

If this message states that a "DB2 CAF CLOSE function ..." then the CAF CLOSE ABORT failed (the ROLLBACK was not successful).

If this message states that a "DB2 CAF OPEN function ..." then the CAF OPEN to reestablish a DB2 thread for this task after the ROLLBACK failed.

In either case, a nonzero return code was received from the DB2 Call Attach Facility (CAF). The return code *return-code* os printed in decimal and the reason code *reason-code* in hexadecimal. For information on SQL and CAF error codes see *DB2 Messages and Codes*.

This message will appear in the output of the job which invoked the OSREQ TSO Command Processor.

Source: Object Access Method (OAM)

System Action: The original STORE or DELETE request has failed. Failure of that request is reported to the requestor in the OSREQ TSO Command Processor job output. This message indicates to the requestor that an unsuccessful attempt was made to either:

- undo the database changes which were made for the failed STORE or DELETE, or
- re-establish the DB2 thread for this task.

The OSREQ TSO Command Processor reports the status of this failed request to the requester, and is then ready to process more requests.

CBR0427I Primary retrieve key = '*primary-retrieve-key***'X**

Explanation: The OSREQ QUERY request was issued and completed successfully. *primary-retrieve-key* is the objects primary retrieve order key. The primary retrieve order key is displayed in hexadecimal format. If a group of OAM objects are to be retrieved, the group of objects to be retrieved should be sorted in ascending order by primary retrieve key, this ensures that the objects are retrieved in the most efficient manner possible.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0428I Backup retrieve key = '*backup-retrieve-key***'X**

Explanation: The OSREQ QUERY request was issued and completed successfully. *backup-retrieve-key* is the objects backup retrieve order key. The backup retrieve order key is displayed in hexadecimal format. If the backup copies of a group of OAM objects are to be retrieved, the group of objects to be retrieved should be sorted in ascending order by backup retrieve key, this ensures that the objects are retrieved in the most efficient manner possible.

Source: Object access method (OAM)

System Action: The OSREQ QUERY function completed successfully.

CBR0431I Error parsing OAMUTIL command, return code = *return-code***.**

Explanation: An error occurred parsing the OAMUTIL command. A non-zero return code *return-code* was received from the TSO parse service routine (IKJPARS).

Source: Object access method (OAM)

System Action: The OAMUTIL command did not complete successfully.

Application Programmer Response: Investigate the return code from the TSO parse service routine (IKJPARS) using the manual *OS/390 TSO/E Programming Services*.

CBR0432I REFORMAT rejected. {Old volume serial number not specified| NEWVOL2 only valid for both side request| SCRATCH only valid for both side request }.

Explanation: OAMUTIL command is submitted in the form of

```
OAMUTIL REFORMAT old-volser
                [ ONE|BOTH]
                [ NEWVOL1(new-volser1)]
                [ NEWVOL2(new-volser2)]
                [ DRIVENAME(drive-name)]
                [ SCRATCH|NOSCRATCH]
                [ FORCE|NOFORCE]
```

The request is rejected. The reason is one of the following:

Old volume serial number not specified The required positional parameter *old-volser* was not specified.

NEWVOL2 only valid for both side request The optional keyword parameter NEWVOL2 is specified for side 2, but the reformat request is only for one side.

SCRATCH only valid for both side request The optional keyword parameter SCRATCH is specified, but the reformat request is only for one side.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: NONE

User Response: Refer to the OAMUTIL command description, correct the syntax and resubmit the command.

CBR0433I REFORMAT unsuccessful. OAM return code = *return-code*, reason code = *reason-code*.

Explanation: The OAMUTIL request ended in error with a non-zero return code.

Source: Object access method (OAM)

System Action: The OAMUTIL function did not complete successfully.

Application Programmer Response: Investigate the return code and the reason code in the message using the list of OAM return codes and reason codes in *DFSMS/MVS DFSMSdfp Diagnosis Reference*.

CBR0434I REFORMAT successful.

Explanation: The OAMUTIL request completed successfully.

Source: Object access method (OAM)

System Action: The OAMUTIL function was performed successfully.

CBR1000I OAM *verb* command execution scheduled.

Explanation: The operator has entered a command of one of the following forms:

```
verb SMS,operand
MODIFY OAM,verb,operand
LIBRARY verb,operand
```

The command has been scheduled for execution to the OAM address space or to a tape library. In the message text, *verb* is replaced by the command verb entered by the operator.

Source: Object access method (OAM)

System Action: After the command is executed, another message is issued to inform the operator of the result.

CBR1010I OAM *verb* command execution failed.

Explanation: The operator has entered a command of one of the following forms:

```
verb SMS,operand
MODIFY OAM,verb,operand
```

An error has occurred during processing of the command by the OAM operator command task. In the message text, *verb* is replaced by the command verb entered by the operator, if the verb was isolated prior to the failure.

Source: Object access method (OAM)

System Action: The command may not be completed, depending on when the error occurred. OAM attempts to continue processing in degraded mode.

Operator Response: Do not attempt to reenter the failing command until OAM has been stopped and restarted. Schedule an OAM restart at the earliest convenient time.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR1050I Command rejected. Verb *verb* invalid.

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,verb,operand
LIBRARY verb,operand
```

The command verb is not one of those which is recognized by OAM:

- DISPLAY or D
- EJECT or E
- LABEL or L
- START or S
- STOP or P
- VARY or V

or by the MVS LIBRARY command:

- EJECT or E
- RESET or R
- DISPCL or DC
- SETCL or SC
- IMPORT or IMP
- EXPORT or EXP

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter a command with the correct verb.

CBR1051I Command rejected. Invalid syntax.

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,verb,operand
LIBRARY verb,operand
```

The command syntax is invalid. Most of the possible syntax errors are the result of misplaced commas: a zero length verb, a zero length operand, or more than two operands.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter a command with the correct syntax.

CBR1052I Command rejected. Operand *operand* too long.

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,verb,operand
LIBRARY verb,operand
```

An operand *operand* is more than eight characters long, or a volume serial number operand is more than six characters long.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter a command with a correct operand.

CBR1053I Command rejected. Operand *operand* extraneous.

Explanation: The operator has entered a command of the following form:

```
MODIFY OAM,verb,operand(s)
```

More operands have been entered than are required by correct command syntax. In the message text, *operand* is replaced by the extraneous operand.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a command with required operands only.

CBR1054I Command rejected. Required operand missing.

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,verb,operand(s)
LIBRARY verb,operand(s)
```

A required operand is missing from the command.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a command with all required operands.

CBR1055I Command rejected. Operand *operand* invalid.

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,verb,operand
LIBRARY verb,operand
```

The operand is not valid for the verb specified.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter the command with a correct operand.

CBR1056I Command rejected. L= operand invalid for verb *verb*.

Explanation: The operator has entered a command of the following form:

```
MODIFY OAM,verb,operand(s),L=cca
```

A location operand was specified for verb *verb*. The location operand is valid only for the verb DISPLAY.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a command using the optional location operand only for verb DISPLAY.

CBR1057I Command rejected. Invalid L= operand.

Explanation: The operator has entered a command in one of the following forms:

```
DISPLAY SMS,operands,L=cca
MODIFY OAM,DISPLAY,operands,L=cca
```

The location operand has an invalid format. The valid location operand formats are: L=cca, L=cc, L=c, L=ca, or L=a, where c is a numeric value from 0 through 9 and a is an alphabetic character; or L=name-a or L=name, where name is an 2–8 character console name, a is an alphabetic character and - is a dash/hyphen.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter a command with a valid location operand.

CBR1058I Command rejected. Invalid device range specified.

Explanation: The operator has entered a command of one of the following forms:

```
LIBRARY verb,device-range,operand
```

The device range specified in the command is invalid.

The valid syntax of the device range to be specified is:

- xxxx-yyyy
- The device numbers must be a hexadecimal value.
- The device numbers cannot be more than 4 hexadecimal characters.
- The second device number yyyy must be greater than the first device number xxxx specified.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter a command with the correct range.

CBR1060I Command rejected. Library name *library-name* undefined.

Explanation: The operator has entered a command which requires the specification of a library name:

```
DISPLAY SMS,LIBRARY(library-name),DETAIL
MODIFY OAM,START,LIBMGT,library-name
```

The library name *library-name* is either not defined in the optical configuration database, or the optical configuration database contains a specified library name, or the library name is not defined in the tape configuration database.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a command with a valid library name.

CBR1061I Command rejected. Drive name *drive-name* undefined.

Explanation: The operator has entered a command which requires the specification of a drive name:

```
DISPLAY SMS,DRIVE(drive-name),DETAIL
```

The drive name *drive-name* is either not defined in the optical configuration database, or the optical configuration database contains it's own specified drive name.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a command with a valid drive name.

CBR1062I Command rejected. Storage group name *sgname* undefined.

Explanation: The operator has entered a command which requires the specification of a storage group name:

```
DISPLAY SMS,STORGRP,sgname,DETAIL
```

The storage group name *sgname* is not defined in the active SMS configuration dataset (ACDS) as being connected to the system on which the command was issued.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a command with a valid storage group name.

CBR1063I Command rejected. Volume serial number *volser* invalid.

Explanation: The operator has entered a command that requires the specification of a volume serial number:

```
DISPLAY SMS,VOL(volser)
MODIFY OAM,EJECT,volser
LIBRARY EJECT,volser
MODIFY OAM,START,RECOVERY,volser
MODIFY OAM,UPDATE,VOLUME,volser....
```

The volume serial number *volser* does not conform to MVS volume serial number naming conventions or the volume serial number naming conventions appropriate for tape libraries.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter a command with a valid volume serial number.

CBR1064I Command rejected. Volume serial number *volser* undefined.

Explanation: The operator has entered a command that requires the specification of a volume serial number:

```
DISPLAY SMS,VOL(volser)
MODIFY OAM,EJECT,volser
LIBRARY EJECT,volser
LIBRARY IMPORT,volser...
LIBRARY EXPORT,volser...
MODIFY OAM,START,RECOVERY,volser
MODIFY OAM,UPDATE,VOLUME,volser....
MODIFY OAM,RELABEL,volser....
```

For commands affecting optical volumes, the volume serial number *volser* is either not defined in the Optical Configuration Data Base, or the Optical Configuration Data Base contains invalid fields in the row for the specified volume serial number. This message will be preceded by a message or messages that will contain information about the nature of the invalid fields in the Optical Configuration Data Base for the volume serial number.

For commands affecting tape volumes, either the volume serial number *volser* is not defined in the tape configuration database, or the volume serial number is defined in the tape configuration database but is for a volume that is not supported by the level of OAM software on this system (volume record contains up-level TDSI information). The possibility also exists that for the volume serial number specified, it is defined in the TDCB , however an SCDS was activated that does not contain any tape library definitions.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter a command with a valid volume serial number.

If the request failed because the volume is not supported on this OAM software level, re-issue the command on a system where it is supported.

CBR1065I Command rejected. Invalid operand *operand* for *vol-type* volume update.

Explanation: The operator has entered the following command:

```
MODIFY OAM,UPDATE,VOLUME,volser,operand1,value1,...
```

The operand *operand* is an invalid field update for the volume type *vol-type* record update.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter the command with valid operands.

Valid operands (field updates) for optical volumes are:

- EMPTY
- LOSTFLAG
- EXPDATE
- FULL
- READABLE
- WRITABLE
- WRITPROT

Valid operands (field updates) for tape volumes are:

- LOSTFLAG
- EXPDATE
- FULL
- PFULL
- READABLE
- WRITABLE

CBR1066I Command rejected. Invalid value *value* for operand *operand*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,UPDATE,VOLUME,volser,operand1,value1,...
MODIFY OAM,UPDATE,SETOAM,scope,operand1,value1,...
MODIFY OAM,UPDATE,SETOPT,scope,operand1,value1,...
MODIFY OAM,UPDATE,OAMXCF,operand1,value1,...
```

The value *value* specified for operand *operand* is an invalid value.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Refer to the command syntax to determine the cause of the error; then enter the command with valid values and operands.

CBR1067I Command failed. DB2 update unsuccessful for volume *volser*.

Explanation: The operator has entered the following command:

```
MODIFY OAM,UPDATE,VOLUME,volser,operand1,value1,...
```

The update to the DB2 table for volume *volser* (VOLUME table for an optical volume, TAPEVOL table for an OAM object tape volume) was not successful.

Source: Object access method (OAM)

System Action: The command fails, processing continues

Operator Response: View the console log to find the DB2 error message which fully described the DB2 table update error encountered.

CBR1068I Command failed. Resource *resource* currently being controlled by *member-name* instance of OAM.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,START,MOVEVOL,volser
MODIFY OAM,STOP,MOVEVOL,volser
MODIFY OAM,START,LIBMGT,library-name
MODIFY OAM,LABEL,drive-name
MODIFY OAM,UPDATE,volser....
LIBRARY EJECT, volser
```

The resource *resource* specified in the command is currently being controlled and managed by another instance of OAM in a parallel

sysplex. The member name of the instance of OAM that currently owns *resource* is *member-name*.

Source: Object Access Method (OAM)

System Action: The command fails; processing continues.

Operator Response: The resource in the command maybe an optical volume, a tape volume, an optical library, or an optical drive. The command can only be issued on the system where the resource is currently being controlled and managed by OAM. For optical volumes, optical libraries, or optical drives, re-issue the failing command on the system where the correct instance of OAM is running, or use the appropriate MVS ROUTE command to send the failing command to the appropriate system.

If the resource is a tape volume, re-issue the failing command on the system where the correct instance of OAM is running, or re-issue the command after the volume is demounted and no longer being controlled and managed by a specific instance of OAM.

CBR1069I Command rejected. OAM is not a member of an XCF group in a sysplex environment.

Explanation: The operator has entered the following command:

```
DISPLAY SMS,OAMXCF
```

The operator has specified a command to display XCF information for the OAM address space, however OAM is not a member of an XCF group.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: If OAM is expected to be a member of an XCF group in a sysplex, verify that OAM was started with a CBROAMxx PARMLIB member that specified the correct XCF group name and member name for OAM. Stop OAM, then start OAM specifying the correct CBROAMxx PARMLIB member.

CBR1070I Command rejected. OAM termination in progress.

Explanation: The operator has entered a command of one of the following forms:

```
verb SMS,operands
MODIFY OAM,verb,operands
LIBRARY verb,operands
```

OAM address space termination is in progress.

Source: Object Access Method (OAM)

System Action: The command is rejected.

CBR1071I Command rejected. OSMC is not installed.

Explanation: The operator has entered a command which must be issued by the OAM Storage Management Component.

```
MODIFY OAM,START,OSMC
MODIFY OAM,START,STORGRP,storage-group-name
MODIFY OAM,START,LIBMGT,library-name
MODIFY OAM,START,DASDSM,storage-group-name
MODIFY OAM,START,RECOVERY,volser
MODIFY OAM,START,OBJRECV,collection-name,object-name
MODIFY OAM,STOP,OSMC
MODIFY OAM,STOP,STORGRP,storage-group-name
DISPLAY SMS,OSMC
DISPLAY SMS,OSMC,resource-name
```

The OAM address space was initialized without OSMC.

Source: Object access method (OAM)

System Action: The command is rejected.

System Programmer Response: To initialize OSMC when the OAM address space is initialized, the OSMC keyword in the PARM field of the JCL statement used to start OAM must be YES (OSMC = YES).

CBR1072I Command rejected. OAM initialization in progress.

Explanation: The operator has entered a command of one of the following forms:

```
verb SMS,operand(s)
MODIFY OAM,verb,operand(s)
```

OAM address space initialization is in progress. No operator command is accepted until initialization is complete.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Wait until message CBR0002I is issued, then reenter the command.

CBR1073I Command rejected. OSMC is not active.

Explanation: The operator has entered a command which must be implemented by the OAM Storage Management Component.

```
MODIFY OAM,START,OSMC
MODIFY OAM,START,STORGRP,storage-group-name
MODIFY OAM,START,LIBMGT,library-name
MODIFY OAM,START,DASDSM,storage-group-name
MODIFY OAM,START,RECOVERY,volser
MODIFY OAM,START,OBJRECV,collection-name,object-name
MODIFY OAM,STOP,OSMC
MODIFY OAM,STOP,STORGRP,storage-group-name
DISPLAY SMS,OSMC
DISPLAY SMS,OSMC,resource-name
```

The OAM address space was initialized with OSMC, but DB2 has stopped which has caused OSMC to become inactive.

Source: Object access method (OAM)

System Action: The command is rejected.

System Programmer Response: Restart DB2.

CBR1074I {SETOAM | SETOPT} update successful for *keyword*, *new-value*, **with a scope of {ALL |** *groupname*}. **The previous value was** *old-value*.

Explanation: A MODIFY OAM,UPDATE command was issued with either the SETOAM or SETOPT keyword. The update was successful for *keyword*, which is the SETOAM or SETOPT keyword that was modified. The value for *new-value* indicates the new value of the keyword after the update has taken place. The *old-value* will be modified. The *old-value* indicates the previous value of the keyword before the update takes place. ALL or *groupname* will either indicate the scope of the update. ALL indicates that all object storage groups and the object backup storage group in the active SMS configuration (except DUMMY and *SCRATCH*) have been updated. The *groupname* indicates that a specific object or object backup storage group has been updated. modified.

CBR1075I {GLOBAL | *groupname*} **value for** *keyword* **is** *value*

Explanation: A MODIFY OAM,DISPLAY command was issued with either the SETOAM or SETOPT keyword. The GLOBAL insert indicates the value being displayed is a global value to OAM. The groupname insert indicates the value being displayed is the value for a particular storage group *groupname*. The current value for the SETOAM or SETOPT keyword *keyword* being displayed is *value*.

CBR1076I Update successful for OAMXCF parameter *parameter* **with a new value** *new-value***. The previous value was** *old-value***.**

Explanation: A MODIFY OAM,UPDATE command was issued for the OAMXCF keyword. The update was successful for the OAMXCF timeout parameter *parameter*. Both the old value *old-value* and the new value *new-value* are displayed so that the results can be verified.

CBR1077I Command rejected. Library *library-name* **in which volume resides is not online and operational.**

Explanation: One of the following library commands was entered:

LIBRARY EXPORT,volser LIBRARY IMPORT,volser

However, the Tape Configuration Database record for volume indicates the volume resides in library *library-name* which is offline, pending offline, or not operational. OAM requires the library to be online and operational to perform the software processing required to complete the function requested.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Resubmit the request when the library is online and operational.

CBR1078I Command rejected. {CBRUXENT Cartridge Entry|CBRUXEJC Cartridge Eject} Installation Exit is disabled.

Explanation: The operator has entered one of the following commands:

LIBRARY IMPORT,volser LIBRARY EXPORT,volser

To successfully schedule an import operation, the cartridge entry installation exit (CBRUXENT) must be enabled in order for OAM to process the imported logical volumes.

To successfully schedule an export operation, the eject installation exit (CBRUXEJC) must be enabled in order for OAM to process the exported logical volumes.

Source: Object access method (OAM)

System Action: The command is rejected.

System Programmer Response: Determine the cause of the installation exit failure. Once corrected, LINKEDIT a new copy of the failed installation exit and either restart OAM or issue the LIBRARY RESET command.

Operator Response: Resubmit the export or import request after the problem with the exit has been resolved.

CBR1079I Command rejected. Volume *volser* **is not in a library.**

Explanation: One of the following library commands was entered; however, the volume *volser* is shelf-resident:

```
LIBRARY EXPORT,volser
LIBRARY IMPORT,volser
LIBRARY EXPORT,volser,CANCEL
LIBRARY IMPORT,volser,CANCEL
```

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: If the volume *volser* is incorrect, submit the command with the correct volume serial number.

CBR1080I Device *dev* **not found.**

Explanation: The operator has entered a command that requires the specification of the MVS device number:

```
LIBRARY DISPCL,device-number
LIBRARY SETCL,device-number,media-type
```

The device number *dev* does not exist in the active I/O configuration.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error; then enter a command with a valid MVS device-number.

CBR1081I Device *device-number* **is not a {library-resident|tape} drive.**

Explanation:

- The operator has entered one of the following commands:

  ```
  LIBRARY DISPCL,device-number
  LIBRARY SETCL,device-number,media-type
  ```

  and the device is not a library-resident tape drive.
- Or the operator has entered the following commands: LIBRARY DISPDRV,device-number and the device is not a tape drive.

The command cannot be completed.

Source: Object Access Method (OAM)

System Action: The command is rejected.

CBR1082I Device *device-number* **now has cartridge loader scratch media type of {UNKNOWN|NONE|MEDIA1|MEDIA2|MEDIA3|MEDIA4}.**

Explanation: The operator has entered the following command:

```
LIBRARY SETCL,device-number,media-type
```

Device *device-number* cartridge loader is now set to the indicated scratch media type. If UNKNOWN is displayed, the LIBRARY SETCL command has been issued by another system and the resulting scratch category is not recognized by this system.

Source: Object Access Method (OAM)

System Action: The command is completed.

CBR1083I Cartridge loader scratch media type cannot be changed on device *device-number***. {Device not online | Incompatible media type | Device assigned elsewhere | Device has no cartridge loader}.**

Explanation: The operator has entered the following command:

```
LIBRARY SETCL,device-number,media-type
```

The LIBRARY SETCL command failed for one of the following reasons.

Device not online Device *device-number* is offline or pending offline.

Incompatible media type Media type *media-type* is invalid for *device-number*.

- For a base 3490 (3480X) device, NONE and MEDIA1 are the valid media types.
- For a 3490E device, NONE, MEDIA1, and MEDIA2 are the valid media types.
- For a 3590 device, NONE, MEDIA3 and MEDIA4 are the valid media types.

Device assigned elsewhere Device *device-number* is currently assigned to another system.

Device has no cartridge loader Device *device-number* has no cartridge loader.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: If the tape drive is offline, vary the tape drive online; then reissue the command. If the media type was incompatible, re-issue the command specifying a valid media type.

CBR1084I No {MEDIA1|MEDIA2|MEDIA3|MEDIA4} scratch volumes available in library *library-name***.**

Explanation: The operator has entered the following command:

```
LIBRARY SETCL,device-number,media-type
```

There are no usable scratch volumes of the specified media type in the library *library-name* where the tape drive resides.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Enter scratch volumes of the specified media type into the tape library.

CBR1090I OAM Access Backup processing started for *reason***.**

Explanation: The operator has entered the following command:

```
MODIFY OAM,START,AB,option
```

The OAM access backup processing is started for *reason*. The value of *reason* can be:

- UNREADABLE VOLUMES
- OFFLINE LIBRARIES
- NOT OPERATIONAL LIBRARIES

If the option specified in the command is 'ALL':

- If access backup processing was not previously started for a specific reason or reasons, this message will be displayed for each of those reasons that access backup is now being activated.
- CBR1092I will be displayed for any access backup reasons that were previously active when this command was issued.

Source: Object access method (OAM)

System Action: OAM processing continues.

CBR1091I OAM Access Backup processing stopped for *reason***.**

Explanation: The operator has entered the following command:

```
MODIFY OAM,STOP,AB,option
```

The OAM access backup processing is stopped for *reason*. The value of *reason* can be:

- UNREADABLE VOLUMES
- OFFLINE LIBRARIES
- NOT OPERATIONAL LIBRARIES

If the option specified in the command is 'ALL':

- If access backup processing is active for a specific reason or reasons, this message will be displayed for each of those reasons that access backup is being stopped.
- CBR1093I will be displayed for any access backup reasons that are already stopped when this command was issued.

Source: Object access method (OAM)

System Action: OAM processing continues.

CBR1092I OAM Access Backup processing already started for *reason***.**

Explanation: The operator has entered the following command:

```
MODIFY OAM,START,AB,option
```

The OAM access backup processing has been started previously for *reason*. The value of *reason* can be:

- UNREADABLE VOLUMES
- OFFLINE LIBRARIES
- NOT OPERATIONAL LIBRARIES

If the option specified in the command is 'ALL':

- If access backup processing is already started for a specific reason or reasons, this message will be displayed for each of those reasons that access backup is already active.
- CBR1090I will be displayed for any access backup reasons that are not already active when this command was issued.

If the option specified in this command is not 'ALL' and access backup is already active for the reason specified, this command is ignored.

Source: Object access method (OAM)

System Action: OAM processing continues.

CBR1093I OAM Access Backup processing already stopped for *reason***.**

Explanation: The operator has entered the following command:

```
MODIFY OAM,STOP,AB,option
```

The OAM access backup processing has been stopped previously and is currently inactive. This stop command is ignored. The value of *reason* can be:

- UNREADABLE VOLUMES
- OFFLINE LIBRARIES
- NOT OPERATIONAL LIBRARIES

If the option specified in the command is 'ALL':

- If access backup processing is not active for a specific reason or reasons, this message will be displayed for each of those reasons that access backup is already inactive.
- CBR1091I will be displayed for any access backup reasons that are active when this command was issued.

If the option specified in this command is not 'ALL' and access backup is already inactive for the reason specified, this command is ignored.

Source: Object access method (OAM)

System Action: OAM processing continues.

CBR1100I OAM status:

Explanation: The OAM status is:

```
OPT. TOT  USE  TOT  USE  AVL  TOT  USE  AVL  TOT  USE  AVL  SCR  REQ
     LIB  LIB  DRV  DRV  DRV  LDR  LDR  LDR  SDR  SDR  SDR  VOL  CT

Access Backup processing{ACTIVE|INACTIVE}for reason
reasons.
XCMODIFY GROUP NAME: group-name
XCMODIFY MEMBER NAME: member-name
```

The operator has entered the following command:

```
DISPLAY SMS,OAM
```

A display of OAM address space status has been generated. If both optical and tape libraries have been defined in the SMS configura-

tion, the sample display above will be generated. Otherwise, only the data for the library type defined will be generated.

For an optical library, the fields displayed in the data line of the multi-line message are as follows:

aaa Total number of optical libraries in the configuration.

bbb Number of usable optical libraries (online and operational).

ccc Total number of optical drives in the configuration.

ddd Number of usable optical drives.

eee Number of available optical drives (online, operational, and not currently in use).

fff Total number of library optical drives in the configuration.

ggg Number of usable library optical drives.

hhh Number of available library optical drives.

iii Total number of stand-alone optical drives in the configuration.

jjj Number of usable stand-alone optical drives.

kkk Number of available stand-alone optical drives.

lll Number of scratch optical volumes in the optical configuration database.

mmm Total number of read requests waiting to be scheduled.

For a tape library, the fields displayed in the data line of the multi-line message are as follows:

nnn Total number of tape libraries defined in the active SMS configuration that are connected to the current system (referred to in the following explanations as a connected tape library). The current system is the system on which the DISPLAY SMS,OAM command is entered.

ooo Number of connected tape libraries that are online.

ppp Number of connected automated tape library dataservers (non-vitrual tape servers).

qqq Number of connected virtual tape servers.

rrrr Total number of tape drives, known to the current system, residing in the connected tape libraries. Includes tape drives in both IBM 3495 Tape Library Dataservers and Manual tape library dataservers.

ssss Total number of tape drives, known to the current system and residing in the connected tape libraries. Includes tape drives in both automated tape library dataservers, virtual tape servers, and manual tape library dataservers.

tttt Total number of tape drives, known to the current system and residing in the connected tape libraries that are online and not allocated.

uuuuuuu Total number of slots in all tape library dataservers.

vvvvvvv Total number of empty slots in all tape library dataservers.

wwwwwww Total number of scratch volumes of all media types in the connected tape libraries. This includes scratch volumes in both the Automated tape library dataserver and the manual tape library dataserver.

xxxxxxx Total number of scratch volumes of all media types in the connected tape libraries. This includes scratch volumes in both the Automated tape library dataserver, virtual tape servers, and the manual tape library dataserver.

For OAM installation exits the fields displayed in the status messages are as follows:

exit-name The name of the exit for which status is being displayed. This can be CBRUXENT, CBRUXEJC, CBRUXCUA, or CBRUXVNL.

Enabled The exit is enabled and executed when the requested function is required.

Disabled The exit has been disabled due to an error or an abend in the installation exit. For CBRUXCUA, the exit is disabled for CUA PRIVATE to SCRATCH requests only.

Bypassed For CBRUXVNL, either the exit returned a return code 16, indicating that it was not to be called again, or an error (or abend) occurred in the exit and the exit will not be invoked. For all other exits, the exit returned a return code 16, indicating that the requested function is to continue without calling the exit.

Operator-disabled For CBRUXENT, the operator has requested that cartridge entry processing be disabled by issuing the LIBRARY DISABLE, CBRUXENT command. Cartridge entry processing can only be enabled by issuing a LIBRARY RESET, CBRUXENT command or a system IPL.

For OAM Access Backup processing, the fields displayed in the status messages are as follows:

reason The reason for which Access Backup processing can be activated. This can be:

- UNREADABLE VOLUMES
- OFFLINE LIBRARIES
- NOT OPERATIONAL LIBRARIES

ACTIVE Access Backup processing is active for this reason.

INACTIVE Access Backup processing is inactive for this reason.

For OAM XCF processing, the fields displayed in the status messages are as follows:

group-name The XCF group name for this OAMPLEX, if a group name and member name were specified in the CBROAMxx PARMLIB member when OAM was initialized. If OAM is not running as part of an OAMPLEX, the value of this field will be 'N/A'.

member-name The XCF member name for this instance of OAM in an OAMPLEX, if a member name and group name were specified in the CBROAMxx PARMLIB member when OAM was initialized. If OAM is not running as part of an OAMPLEX, the value of this field will be 'N/A'.

Source: Object access method (OAM)

System Action: None.

CBR1110I OAM library status:

Explanation:

```
OPTICAL  DEVICE   ATT USE AVL TOT EMP SCR PT DEV ON OP IO LIB   READ

LIBRARY   TYP  TYPE     DRV  DRV  DRV   SLOTS  SLOTS   VOLS
tlibname  typ  tdevtype lll  mmm  nnn  oooooo pppppp qqqqqq  r  s
```

The operator has entered one of the following commands:

```
DISPLAY SMS,LIBRARY(library-name),DETAIL
DISPLAY SMS,LIBRARY(ALL),DETAIL
```

A display of OAM library status has been generated. When a library name is supplied, there is one data line describing the specified library; when ALL is supplied, there is one data line for each library in the configuration. If both optical and tape libraries have been defined in the SMS configuration, the sample display above will be generated. Otherwise, only the data for the library type defined will be generated.

For an optical library, the fields displayed in each data line of the multi-line message are as follows:

olibname Name of the optical library.

odevtype Name of the library device type, as follows:

- **3995-111** 3995 rewritable library, extension to 3995-131
- **3995-112** 3995 write-once library, extension to 3995-132
- **3995-113** 3995 multi-function library, extension to 3995-133
- **3995-131** 3995 rewritable library and controller
- **3995-132** 3995 write-once library and controller
- **3995-133** 3995 multi-function library and controller
- **3995-C3A** 3995 multi-function library controller
- **3995-C12** 3995 multi-function library, extension to 3995-C32
- **3995-C16** 3995 multi-function library, extension to 3995-C36
- **3995-C18** 3995 multi-function library, extension to 3995-C38
- **3995-C32** 3995 multi-function library, attaches to 3995-C3A
- **3995-C34** 3995 multi-function library, attaches to 3995-C3A
- **3995-C36** 3995 multi-function library, attaches to 3995-C3A
- **3995-C38** 3995 multi-function library, attaches to 3995-C3A
- **9246** IBM 9246 optical disk library

aaa Total number of optical drives defined to the optical library.

bbb Number of usable optical drives (online, operational, and not pending offline).

ccc Number of available optical drives (online, operational, not pending offline, and not currently in use).

ddd Total number of storage slots in the optical library.

eee Number of empty storage slots in the optical library.

fff Number of scratch volumes in the optical library.

g Active path to the optical library, as follows:

- **P** Primary
- **A** Alternate
- *blank* Pseudo-library or 3995 library

hhhh MVS/ESA device number of the active CTC or *blank* for pseudo-libraries

i Optical library online status, as follows:

- **Y** Online
- **N** Offline
- **P** Pending offline

j Optical library operational status, as follows:

- **Y** Operational
- **N** Not operational

k Optical library input/output station operational status, as follows:

- **Y** Operational
- **N** Not operational
- *** An error occurred while trying to get the status
- *blank* Library not attached or library has no I/O station

lbcmd For 3995 libraries, REMAP indicates that a REMAP of the library is in progress, RMPND indicates that a REMAP is pending for the library, and AUDIT indicates that a full library audit is being processed. If not REMAP, RMPND, or AUDIT, this field contains the library command most recently sent to this optical library.

rdcnt The number of read requests waiting or in progress for optical volumes that are resident in this optical library.

If a specific optical library is requested in the DISPLAY SMS,LIBRARY command, then the additional data lines will appear as follows:

```
-------------------------------------------
DEFAULT PSEUDO LIB: def-plib-name
DEFAULT MEDIA TYPE: def-mediatype
XCF MEMBER NAME: member-name
-------------------------------------------
```

The value of *def-plib-name* in the data line is the name of the psuedo library that will be assigned to any volume that is ejected from this library if that volume does not already have a pseudo library associated with it. *Def-plib-name* is specified on the 3995 Library Define panel in ISMF.

The value of *def-mediatype* in the data line indicates what media types can be entered into the optical library and what media types can be written to if they already reside in the library. *Def-mediatype* is specified on the 3995 Library Define panel in ISMF.

The value of *member-name* in the data line is the XCF member name associated with the instance of OAM where this library is currently online. If the library is not online to any instance of OAM in the OAMPLEX, this field will contain blanks. If this instance of OAM is not currently part of an OAMPLEX, this field will contain 'N/A'.

For a tape library, the fields displayed in the data line of the multiline message are as follows:

tlibname The name of the tape library.

typ The tape library type, as follows:

- **AL** Automated tape library dataserver
- **ML** Manual tape library dataserver

UNK Unable to obtain the tape library type from the hardware.

VL Virtual tape server.

tdevtype The device type of the tape library as follows:

3494-L10 IBM 3495 Tape Library Dataserver Model L10

3495-L20 IBM 3495 Tape Library Dataserver Model L20

3495-L30 IBM 3495 Tape Library Dataserver Model L30

3495-L40 IBM 3495 Tape Library Dataserver Model L40

3495-L50 IBM 3495 Tape Library Dataserver Model L50

3495-M10 IBM 3495 Tape Library Dataserver Model M10

lll The total number of tape drives, known to the current system, residing in the tape library dataserver.

mmm The number of tape drives, known to the current system and residing in the tape library, that are online.

nnn The number of tape drives, known to the current system and residing in the tape library, that are online and not allocated.

oooooo The total number of storage slots in the tape library dataserver.

pppppp The number of empty slots in the tape library dataserver.

qqqqqq The total number of eligible scratch volumes in the tape library dataserver.

r The tape library dataserver online status, as follows:

Y Online

N Offline

P Pending offline

s The tape library operational status, as follows:

Y Operational

N Not operational

If a specific tape library dataserver is requested in the DISPLAY SMS,LIBRARY command, then additional data lines appear containing information about that library, as follows:

```
-------------------------------------------------
MEDIA       SCRATCH       SCRATCH
TYPE          COUNT     THRESHOLD
MEDIA1       vvvvvv        xxxxxx
MEDIA2       wwwwww        yyyyyy
MEDIA3       zzzzzz        ababab
MEDIA4       acacac        adadad
-------------------------------------------------
OPERATIONAL STATE:{AUTOMATED|PAUSED|MANUALMODE|
MANAGED MANUALMODE}
ERROR CATEGORY SCRATCH COUNT:          aeaeae
SCRATCH STACKED VOLUME COUNT:          afafaf
HIGH CAPACITY INPUT STATION CAPACITY:  tttttt
HIGH CAPACITY OUTPUT STATION CAPACITY: uuuuuu
-------------------------------------------------
[status lines]
```

The media type, scratch count and scratch threshold lines will only be displayed for media that have a threshold value or a scratch count greater than zero.

The error category will display the total number of scratch volumes that have a software error associated with them. Scratch volumes in this category will still have a use attribute of scratch; however, they are not eligible to be mounted.

The scratch stacked volume count will only be displayed for a virtual tape server (VTS) library and indicates the number of available physical scratch volumes.

The high capacity input and output station lines will only be displayed for a 3494 or 3495 Automated tape library dataserver and only if the station has been configured.

Additional status lines may appear containing one or more of the following messages:

```
Operation degraded due to unavailable hardware resource.

Safety enclosure interlock open.

Vision system not operational.

Library manager offline.

Operator intervention required.

Library manager check 1 condition.

All storage slots full.

Out of cleaner volumes.

Dual write disabled.

Library manager switchover in progress.

Environmental alert.

All convenience input stations empty.

All convenience output stations empty.

All convenience output stations full.

Bulk {input/output|output}
{configured|not configured}.

High capacity output station full.

{Input|Output} door is open.

Convenience I/O station installed.

Convenience I/O station in {Input|Output|Import} mode.

Convenience I/O station {Empty|Full}.

Single cell output facility in use for eject.

Host initiated import in process.

Host initiated export in process.

Library initiated single volume import in process.
```

System Action: None.

CBR1115I No libraries defined to OAM.

Explanation: The operator has entered the following command:

```
DISPLAY SMS,LIBRARY(ALL),DETAIL
```

There are no libraries defined in the optical configuration database or the tape configuration database.

Source: Object access method (OAM)

System Action: None.

CBR1120I OAM drive status:

Explanation:

```
DRIVE    DEVICE   TY LIBRARY  ON OP AV WP  DEV SC DRV  MOUNT   PEND
NAME     TYPE        NAME                 NUM SI NUM  VOLUME  VOLUME
drvname  devtype  a  libname  b  c  d  e  ffff  g hhh  mntvol  pndvol
```

The operator has entered one of the following commands:

```
DISPLAY SMS,DRIVE(drive-name),DETAIL
DISPLAY SMS,DRIVE(library-name),DETAIL
DISPLAY SMS,DRIVE(ALL),DETAIL
```

A display of OAM drive status has been requested. When a drive name is supplied, there is one data line describing the specified drive; when a library name is supplied, there is one data line for each drive in the specified library; when ALL is supplied, there is one data line for each drive in the configuration. The fields displayed in each data line of the multi-line message are as follows:

drvname Name of the optical drive.

devtype Name of the drive device type, as follows:

3995-111 3995 rewritable optical disk drive.

3995-112 3995 write-once optical disk drive.

3995-113 3995 multi-function optical disk drive.

3995-131 3995 rewritable optical disk drive.

3995-132 3995 write-once optical disk drive.

3995-133 3995 multi-function optical disk drive.

3995-SW3 3995 multi-function optical disk drive.

3995-SW4 3995 multi-function optical disk drive

9247 9246 library drive.

a Optical drive type, as follows:

L Library.

S Stand-alone.

libname Name of the library to which the optical drive is attached. For a stand-alone/operator-accessible optical drive, this field contains the name of the pseudo-optical library that this drive is associated with in its SCDS definition.

b Optical drive online status, as follows:

Y Online.

N Offline.

P Pending offline.

c Optical drive operational status, as follows:

Y Operational.

N Not operational.

d Optical drive availability status, as follows:

Y Available. The optical drive is online, operational, and not busy.

N Not available.

e Write Protection status as follows:

Y Write protection is on. Writing to this drive is not allowed.

N Write protection is off. Writing to this drive is allowed.

The write protection status reflects the switch setting as of the last volume mount, vary online or drive error processing.

ffff MVS/ESA device number of the CTC which is used to communicate with the optical drive.

g SCSI bus address of the optical drive on the SCSI interface. Not used for 3995 and will be blank.

hhh Drive number of the optical disk drive.

mntvol Volume serial number of the volume which is currently mounted on the optical drive. If there is no mounted volume, this field is blank.

pndvol Volume serial number of the volume for which a mount is pending on the optical drive. If there is no pending mount, this field is blank. Will be blank when used for 3995.

If a specific optical drive is requested in the DISPLAY SMS,DRIVE command, then the additional data line will appear, containing XCF information about that drive, as follows:

```
-----------------------------------------------
XCF MEMBER NAME: member-name
-----------------------------------------------
```

The value of *member-name* in the data line is the XCF member name associated with the instance of OAM where this drive is currently online. If the drive is not online to any instance of OAM in the OAMPLEX, this field will contain blanks. If this instance of OAM is not currently part of the OAMPLEX, this field will contain 'N/A'.

CBR1130I OAM storage group status:

Explanation:

```
OPTICAL  TY WRIT  REQ ACT START  OSMC         LIBRARY
STORGRP    VOLS  CT  DRV THRES   SYSTEM       NAMES
 sgname    a   bbb  cccc ddd  eeeee   sysname  libname1 libname2 libname3
                                               libname4 libname5 libname6
                                               libname7 libname8

TAPE      LIBRARY
STORGRP   NAMES
sgname    libname1  libname2  libname3  libname4
          libname5  libname6  libname7  libname8
```

The operator has entered one of the following commands:

```
DISPLAY SMS,STORGRP(storage-group-name),DETAIL
DISPLAY SMS,STORGRP(ALL),DETAIL
```

A display of OAM storage group status has been requested. When a storage group name is supplied, there is one data line describing the specified storage group; when ALL is supplied, there is one data line

for each storage group in the configuration. If both object and tape storage groups have been defined in the SMS configuration, the sample display above will be generated. Otherwise, only the data for the storage group type defined will be generated.

The fields displayed in each data line are as follows:

sgname Name of the storage group.

libname1 libname2 libname3 libname4 libname5 libname6 libname7 libname8 Names of the one to eight libraries associated with the storage group. If volumes from the optical storage group or backup optical storage group reside on the shelf, then the first optical library name is the name of the pseudo library and the other seven names are blank.

For object storage groups, the additional fields displayed in each data line are as follows:

a Optical storage group type, as follows:

- **B** Backup.
- **G** Group.
- **N** Nongroup. Currently not used.
- **S** Scratch.

bbb Number of volumes in the optical storage group which have space available for writing objects.

cccc Number of write requests for the optical storage group which are currently pending in OAM.

ddd Number of drives which are currently processing write requests for the optical storage group.

eeeee Optical drive start-up threshold. When the number of requests per active optical drive exceeds this threshold, another drive may be started.

sysname The OSMC processing system name. Defined in the object storage group definition in the active SMS configuration (ACDS), this is the system where OSMC storage group processing is done either automatically when the cycle start time window occurs, or when a full OSMC cycle is requested on that system. If this field is blanks, a specific system was not requested, storage group processing will be started on any system where OAM and OSMC are active and an OSMC cycle is requested on that system, or when the cycle start time window occurs.

status
```

The operator has entered the following command:

```
DISPLAY SMS,VOL(volser)
```

A display of OAM volume status has been requested. Status is reported for the requested optical volume and for its opposite side volume. The fields displayed in each data line are as follows:

volser Volume serial number of the requested optical volume.

oppvol Volume serial number of the opposite side volume.

sgname Name of the storage group to which the optical volume belongs.

a Optical volume readability status, as follows:

- **Y** Readable.
- **N** Unreadable.

b Optical volume writeability status, as follows:

- **Y** Writable.
- **N** Unwriteable.

c Optical volume write protection status, as follows:

- **Y** Write protected.
- **N** Not write protected.

mediatyp 8 character media type of the requested optical volume.

freespac Remaining volume space of the requested optical volume in kilobytes (KB).

fff% Percentage of free space on the optical volume. For a full optical volume, this field contains FULL.

mdrvname Name of the drive where this optical volume is mounted. If the optical volume is not mounted, this field contains blanks.

pdrvname For 9247: the name of the drive where a mount is pending for this optical volume. If no mount is pending, this field contains blanks.

For 3995: YES if a mount is pending for this optical volume.

ggg Number of read requests for this optical volume which are currently pending in OAM.

media_descript 72 character description of the requested optical volume.

libname Name of the library in which the optical volume resides. This field appears only for a library optical volume.

shelfloc Shelf location where the optical volume is to be found. This field appears only for a shelf optical volume.

plib-name The pseudo library name that this volume is assigned to when the volume is shelf resident.

owner-information Owner information from the optical volume label.

member-name The XCF member name of the OAM which is currently managing and controlling this optical volume, or -N/A-.

volser Volume serial number of the requested optical volume.

createdate Date the optical volume was created, in the format YYYY-MM-DD.

lwdate Date the optical volume was last written to, in the format YYYY-MM-DD.

lmdate Date the optical volume was last mounted, in the format YYYY-MM-DD.

eedate Date the optical volume was last entered or ejected from the library, in the format YYYY-MM-DD.

expdate Expiration date of the optical volume, in the format YYYY-MM-DD.

status If the optical library slot assigned to these optical volumes is empty or contains different optical volumes, the following status message is displayed:

- Optical volumes not in assigned optical library slot.

Source: Object access method (OAM)

System Action: None.

CBR1180I OAM tape volume status:

Explanation:

```

ENTER/EJECT DATE:   hhhhhhhhh
SHELMODIFY LOCATION:     shelfloc
OWNER: owner-information
-----------------------------------------------------------------
[status lines]
```

The operator has entered the following command:

```
DISPLAY SMS,VOLUME(volser)
```

A display of volume status has been requested. Status is reported for the requested tape volume. The fields displayed in each data line are as follows:

volser Volume serial number of the requested tape volume.

medtype The media type of the tape volume.

MEDIA1	cartridge system tape
MEDIA2	enhanced capacity cartridge system tape
MEDIA3	High Performance Cartridge Tape
MEDIA4	Extended High Performance Cartridge Tape
UNKNOWN	No media type specified.

sgname Name of the storage group to which the tape volume belongs.

libname Name of the library in which the tape volume resides. If the volume resides outside a library, this field contains 'SHELF'.

u The volume use attribute, as follows:

P	Private use attribute
S	Scratch use attribute.

x The volume write protection status, as follows:

Y	Write protected
N	Not write protected
blank	Write protection status unknown.

y The volume checkpoint status, as follows:

Y	Secure checkpoint volume
N	Not a checkpoint volume
blank	Checkpoint status unknown.

errstat The volume error status, as follows:

ANSILAB	ANSI label not supported.
CHECKPT	Attempt to access secure checkpoint volume.
DAMAGED	Cartridge is physically damaged and leader block may be missing.
DUPMOUNT	Volume with same volser already mounted.
EXTLABEL	External label missing or unreadable.
INACCESS	Volume inaccessible in library.
INTLABEL	Volume label cannot be read.
LABTYPE	Invalid volume label type, neither standard nor ANSI.
LNGTHERR	Cartridge length exceeds maximum volume length.
MEDIAMNT	Media type does not match the type specified for the scratch volume mount request.
MED2MNT	Media 2 cartridge mounted on non-media 2 capable device.
MISSING	Volume not in assigned location in library.
NOERROR	No errors detected.
NOMATCH	Internal and external volume labels do not match.
NOTINLIB	Volume not in library manager inventory.
PASSPROT	Attempt to access password-protected volume.
RACFPROT	Attempt to access SAF/RACF-protected volume.

REJTMS Volume rejected by the tape management system.

REJUSER Volume rejected by the user's DCB exit or label editing routine.

TRKCMPAT Media was mounted whose recording technology is incompatible with the device.

UNEXPIR Attempt to write over unexpired data.

UNFORMAT Volume has not been formatted with servo tracks.

UNKNOWN Volume error status unknown.

WRITPROT Attempt to write on write-protected volume.

WRONGVOL Library mounted different volume when this volume was requested.

category The library category to which the volume is assigned, as follows:

BULKEJCT The volume is to be ejected to the high capacity output station.

CONVEJCT The volume is to be ejected to a convenience output station.

ERROR An error has been detected by software during an attempt to mount this scratch volume.

INSERT The volume has been entered into the library, but has not yet been processed by software cartridge entry.

EXPPEND The logical volume is export pending in the library.

EXPORTED The logical volume has been exported onto a stacked volume, but export completion processing has not occurred at the host.

MANEJECT The volume has been manually removed from the library. Volumes in this category are not processed by the host and are left in this category.

NONE The volume resides outside of a tape library.

NOTAVAIL The OAM display processor was unable to obtain the volume data record from the tape library.

PRIVATE The volume contains useful data and may be requested only by specific volser reference.

SCRMED1 The volume contains no useful data and may be requested only by nonspecific volser reference. It resides in the library category for scratch volumes of media type Cartridge System Tape.

SCRMED2 The volume contains no useful data and may be requested only by nonspecific volser reference. It resides in the library category for scratch volumes of media type Enhanced Capacity Cartridge System Tape.

SCRMED3 The volume contains no useful data and may be requested only by nonspecific volser reference. It resides in the library category for scratch volumes of media type MEDIA3.

SCRMED4 The volume contains no useful data and may be requested only by nonspecific volser reference. It resides in the library category for scratch volumes of media type MEDIA4.

UNKNOWN The hardware category is not recognized by software on this system.

aaaaaaaaaa Recording technology used to record the tape.

18 TRACK 18-track recording mode

36 TRACK 36-track recording mode

128 TRACK 128-track recording mode

256 TRACK 256-track recording mode

UNKNOWN Recording mode not specified

bbbbbbbbbb Compaction mode set during recording.

YES Compaction

NO No compaction

UNKNOWN Compaction not specified

INVALID Compaction specified is invalid.

ccccccccc Volume special attribute.

RDCOMPAT Volume used for read only. All read-compatible devices are eligible.

NONE Volume has no special attribute.

INVALID Special attribute specified is invalid.

ddddddddd Date the volume record in the tape configuration database (TDCB) was initially created, in ISO date format YYYY-MM-DD.

eeeeeeeeee Expiration date of the tape volume, in ISO date format YYYY-MM-DD.

fffffffff Date the volume was last mounted, in ISO date format YYYY-MM-DD.

gggggggggg Date a dataset was last opened for output on the volume, in ISO date format YYYY-MM-DD.

hhhhhhhhhh Date the volume was last entered into or ejected from a tape library, in ISO date format YYYY-MM-DD.

shelfloc If the tape volume resides outside a library, this is the shelf location where the volume is stored. Otherwise, this is the shelf location where the volume will be stored after it is ejected from the library.

owner-information Owner information associated with the tape volume.

status lines Additional tape volume status messages as follows:

```
Audit operation queued in host.

Audit operation queued in library.

Audit operation in progress in library.

Eject operation queued in host.

Eject/Export operation queued in library.

Eject/Export operation in progress in library.

Export operation pending in library.

Export operation complete in library.

Mount operation queued in library.

Mount operation in progress in library.

Volume mounted on library-resident drive.

Demount operation queued in library.

Demount operation in progress in library.

Volume inaccessible in library.

Volume misplaced in library.

External label missing or unreadable.

Volume used during manual mode.

Logical volume.
```

Source: Object Access Method (OAM)

System Action: None.

CBR1190I DISPLAY rejected. Resource type *resource-type* **invalid.**

Explanation: The operator has entered a command of the form:

```
DISPLAY SMS,resource-type
```

The resource type to be displayed is invalid. It must be OAM, OSMC, LIB, DRIVE, STORGRP, or VOL. In the message text, *resource-type* is replaced by the invalid resource type.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a DISPLAY command with the correct resource type.

CBR1200I EJECT rejected. Volume *volser* **not in a library.**

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,EJECT,volser
LIBRARY EJECT,volser
```

The specified volume *volser* does not reside in a library.

Source: Object access method (OAM)

System Action: The command is rejected.

CBR1201I EJECT rejected. Volume *volser-1* **or** *volser-2* **busy.**

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,EJECT,volser
LIBRARY EJECT,volser
```

The specified volume *volser-1*, or its opposite side volume *volser-2*, is busy and therefore not available to be ejected from the library where it currently resides. A volume is busy when a mount is pending, or when a pending unit of work has specifically requested it.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Use the DISPLAY SMS,VOL command to determine why the volume is busy. The EJECT command may be reentered at a later time.

CBR1202I EJECT rejected. Library *library-name* **cannot eject volume** *volser***.**

Explanation: An ISMMODIFY EJECT line operator is entered or the operator has entered one of the following commands:

```
MODIFY OAM,EJECT,volser
LIBRARY EJECT,volser
```

The library *library-name* in which the specified volume *volser* resides is not currently capable of ejecting a volume. The library is offline or not operational, or the optical library input/output station is not operational, or the tape library vision system is not operational.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Use the DISPLAY SMS,LIBRARY command to determine library status. If the library is currently offline, use the VARY SMS,LIBRARY command to VARY it online. If the library is currently not operational, use the VARY SMS,LIBRARY command first to VARY the library offline and then to VARY it online. Once the library is online, reenter the EJECT command. If the optical input/output station is not operational, or after using the VARY commands the library is still not operational, contact a service representative. If the tape library vision system is not operational, contact a service representative.

CBR1203I EJECT rejected. Operand *operand* **invalid.**

Explanation: The operator has entered one of the following commands:

```
LIBRARY EJECT,volser,operand
MODIFY OAM,EJECT,volser,operand
```

Operand *operand* is invalid. The valid operands are LOCATION, L, KEEP, K, PURGE, P, BULK, or B. The LOCATION or L operand is the only valid operand for optical volume ejects. The BULK or B operand can be used in addition to the other operands.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Enter a command with the correct operand syntax.

CBR1204I EJECT rejected. Volume *volser-1* or *volser-2* EJECT already in process.

Explanation: An ISMMODIFY EJECT line operator was entered or the operator has entered a command of one of the following forms:

```
MODIFY OAM,EJECT,volser
LIBRARY EJECT,volser
```

The specified volume *volser-1*, and its opposite side volume *volser-2*, are in the process of being ejected from a previous eject command.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Use the DISPLAY SMS,VOL command to determine the volume status.

CBR1210I EJECT rejected. Volume *volser* is mounted on non-operational drive *drvname*.

Explanation: The operator entered a command of one of the following forms:

```
MODIFY OAM,EJECT,volser
LIBRARY EJECT,volser
```

or an ISMF user requested an EJECT of the volume *volser* by using mountable optical volume list.

The volume specified is mounted on a nonoperational drive *drvname*, and therefore cannot be ejected.

Source: Object access method (OAM)

System Action: The system rejects the command.

Operator Response: Use the DISPLAY SMS,DRIVE command to determine drive status. Use the VARY SMS,DRIVE command to VARY the nonoperational drive offline, then use the OAM VARY command to VARY the drive online. If the nonoperational status was not cleared by varying the drive offline and back online, contact a service representative.

If the original EJECT request was issued by the operator, once the drive is online and operational, reenter the EJECT command.

System Programmer Response: If the original EJECT command was an ISMF EJECT, once the operator has varied the nonoperational drive offline and back online, reenter the ISMF EJECT.

CBR1211I Volume *volser* is not an optical volume. Use the LIBRARY EJECT command.

Explanation: The operator has entered the following command:

```
MODIFY OAM,EJECT,volser,operand
```

Volume serial number *volser* is not found in the optical configuration device.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: If this could be a tape volume, resubmit the eject request using the LIBRARY EJECT command. Otherwise, determine the cause of the error; then enter a command with a valid volume serial number.

CBR1212I EJECT rejected. Volume *volser* not tape, but operand *operand* implies tape.

Explanation: The operator has entered the following command:

```
LIBRARY EJECT,volser,operand(s)
```

The specified operand is valid only for volumes found in the tape configuration (TCDB) and the tape volume record for the volume specified on the eject command was not found.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Enter a command with the correct operand syntax.

CBR1213I EJECT rejected. Volume *volser* not optical, but operand *operand* implies optical.

Explanation: The operator has entered the following command:

```
LIBRARY EJECT,volser,operand(s)
```

The specified operand is valid only for volumes found in the optical configuration database (OCDB) and a volume record for the volume specified on the eject command was not found.

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Enter a command with the correct operand syntax. For tape resident volume ejects, refer to the syntax diagram documented in the *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Tape Libraries* or, for optical volume ejects, the *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support*.

CBR1214I EJECT rejected. Operand *operand1* conflicts with operand *operand2*.

Explanation: The operator has entered the following command:

```
LIBRARY EJECT,volser,operand(s)
```

The specified operand *operand1* is valid for one media type and the specified operand *operand2* is valid for a different media type. In other words, one of the following is true:

- *operand1* is valid only for tape volumes and *operand2* is valid only for optical volumes

  or

- *operand1* is valid only for optical volumes and *operand2* is valid only for tape volumes

Source: Object Access Method (OAM)

System Action: The command is rejected.

Operator Response: Enter a command with the correct operand syntax. For tape resident volume ejects, refer to the syntax diagram documented in the *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Tape Libraries* or, for optical volume ejects, the *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support*.

CBR1220I Tape drive status:

Explanation:

```
DRIVE  DEVICE   LIBRARY  ON  OFFREASN  LM  ICL     ICL   MOUNT
NUM    TYPE     NAME        LI OP PT  AV  CATEGRY LOAD  VOLUME
devnum devtype  libname  b   c  d  e   f   ggggggg  h     mntvol
```

The operator has entered one of the following commands:

```
LIBRARY DISPDRV,device_number
LIBRARY DISPDRV,library_name
LIBRARY DISPDRV,device_number,number_of_devices
LIBRARY DISPDRV,device_number1-device_number2
```

A display of tape drive status has been requested.

- When a tape device number is supplied, there is one data line describing the specified drive.
- When a library name is supplied, there is one data line for each tape drive in the specified library. However, the maximum number of tape drives displayed will not exceed 64.
- When a tape device number and the number of devices are supplied, there is one data line for each tape drive in the specified range. However, the maximum number of tape drives displayed will not exceed 64.
- When two tape device numbers are supplied and the second device number is greater than the first device number, there is one data line for each tape drive in the specified range. However, the maximum number of tape drives displayed will not exceed 64.

The fields displayed in each data line of the multi-line message are as follows:

devnum The device number of the tape drive.

devtype Name of the tape drive device type, as follows:

3480 Reads and writes using 18-track recording technique on MEDIA1 cartridges. Incapable of compaction.

3480X Reads and writes using 18-track recording technique on MEDIA1 cartridges. Capable of compaction.

3490 Reads 18-track and 36-track recording technique on MEDIA1 and MEDIA2 cartridges. Writes using 36-track recording technique on either MEDIA1 or MEDIA2 cartridges. Capable of compaction.

3590-1 Reads and writes using 128-track recording technique on MEDIA3 and MEDIA4 cartridges. Capable of compaction.

3590-E Reads 128-track and 256-track recording technique on MEDIA3 and MEDIA4 cartridges. Writes using 256-track recording technique on either MEDIA3 or MEDIA4 cartridges. Capable of compaction. 3590-E is used in this display to represent the 3590-E1x family or 3590 tape devices and is not a system-defined esoteric.

3400 3400 magnetic tape drive

UNKNOWN Tape device type is not recognized.

Whether a device defined through HCD is real or emulated is not determined until successful communication to the device has been made. Until successful communication has been made, the device type displayed will reflect the device type defined through HCD. Thus for emulated devices, such as the 3590 Model E, the device type displayed will reflect the emulated device type defined through HCD rather than the real underlying device type (3590-E). Once successful communication to the device has been established, the device type displayed will reflect the real underlying device type.

Also, on levels of DFSMS/MVS that support the emulated device type defined through HCD, but do not support the real underlying device type (such as the 3590 Model E), the device type displayed will reflect the emulated device type defined through HCD.

libname Name of the library in which the tape drive resides. For a stand-alone tape drive (non-library resident drive), this field contains '--N/A--'.

b Tape drive online status, as follows:

Y Online.

N Offline.

Also, a device can be offline with none of the reason indicators below being set. For instance, if a device goes through IOS recovery and the device ends up getting boxed, the reason indicator may not be set.

c Tape drive offline for library reason:

Y The library in which the tape drive resides is offline.

N The library in which the tape drive resides is online.

- The tape drive does not reside in a tape library.

d Tape drive offline for operator reason:

Y The operator has varied the tape drive offline, or the device is defined offline at initialization.

N The operator has varied the tape drive online.

e Tape drive offline for path reason:

Y All channel paths to the tape drive are offline.

N At least one channel path to the drive is online.

f Library Manager device availability status:

A The tape drive is available at the Library Manager.

U The tape drive is unavailable at the Library Manager.

- The tape drive does not reside in a tape library or the library manager drive availability status is unknown.

ggggggg Cartridge loader scratch media category:

MEDIA1 The cartridge loader of the tape drive is set to load with MEDIA1 scratch tapes if available.

MEDIA2 The cartridge loader of the tape drive is set to load with MEDIA2 scratch tapes if available.

MEDIA3 The cartridge loader of the tape drive is set to load with MEDIA3 scratch tapes if available.

MEDIA4 The cartridge loader of the tape drive is set to load with MEDIA4 scratch tapes if available.

X'xxxx' The hexadecimal value of the assigned category, which is not recognized by this system.

NONE No category is assigned to the cartridge loader. No scratch tape is loaded.

--N/A-- This is not a library-resident tape drive.

h Volume loaded in the cartridge loader:

Y At least one volume has been loaded in the cartridge loader.

N No volume has been loaded in the cartridge loader.

\- The tape drive does not reside in a tape library.

mntvol Volume serial number of the volume which is currently mounted on the tape drive. If there is no mounted volume, this field is blank.

Additional information may appear containing one or more of the following messages:

- Starting device number is not a tape device.
- Number of tape devices requested exceeds 64, 64 devices displayed.
- Number of tape devices requested exceeds the number available.
- No tape devices within display criteria.

Source: Object access method (OAM)

System Action: None.

CBR1240I OAM object tape volume status:

Explanation:

```
VOLUME STORAGE  UNITNAME  RD WR CM IN  MED  FREE-SPACE  %   LOST REQ
       GROUP                    USE TYPE            FULL FLAG CT
volser sgname   unitname  a  b  c  d    ee  fffffffff  gg    h  iii
XCF MEMBER NAME: member-name
CAPACITY:        capacity
ERDS PHYSICAL ID:  epi
CREATION DATE:     createdate
LAST WRITTEN DATE: lwdate
LAST MOUNTED DATE: lmdate
EXPIRATION DATE:   expdate
```

The operator has entered the following command:

```
DISPLAY SMS,VOL(volser)
```

A display of OAM volume status has been requested. The volume is a tape volume used by OAM for object data. Status is reported for the requested tape volume, with pertinent object related information. If the tape volume is also used within an IBM tape library, or has an entry in the Tape Configuration Database (TCDB), CBR1180I will also be issued with tape library related information. The fields displayed in each data line are as follows:

volser Volume serial number of the requested tape volume.

sgname Name of the object storage group to which the tape volume belongs.

unitname MVS unit name used when the tape volume is allocated. If the tape volume is in an IBM tape library, this value is ignored.

a Tape volume readability status, as follows:
Y Readable.
N Unreadable.

b Tape volume writability status, as follows:
Y Writable.
N Unwritable.

c Compaction indicator for this tape volume, as follows:
Y Tape volume written in compacted format
N Tape volume written in noncompacted format

d Tape volume in use indicator for this tape volume, as follows:
Y Tape volume currently in use by an OAM drive task
N Tape volume not currently in use by an OAM drive task

ee Media type the requested tape volume as follows:
02 IBM Cartridge System Tape
04 IBM Enhanced Capacity Cartridge System Tape
05 IBM High Performance Cartridge System Tape
06 Extended High Performance Cartridge System Tape

fffffffff Remaining space on the requested tape volume in kilobytes (KB).

gg Percentage that the requested tape volume is full, (percentage of the tape that has been used).

h Volume lost indicator
Y Volume is marked lost
N Volume not marked lost

iii Number of read requests for this tape volume which are currently pending in OAM.

member-name The XCF member name of the OAM which is currently managing and controlling this tape volume, or -N/A-.

capacity Approximate number of millimeters of tape or approximate number kilobytes of data which can be written to the volume, allowing variance for different manufacturers

epi The ERDS Physical Identifier (EPI) which indicates the real underlying device type that is used to write OAM objects to this volume. This is used to assist in problem diagnosis in a mixed device environment where native and emulated devices coexist.

createdate Date the tape volume was created, in the format YYYY-MM-DD.

lwdate Date the tape volume was last written to, in the format YYYY-MM-DD.

lmdate Date the tape volume was last mounted, in the format YYYY-MM-DD.

expdate Expiration date of the tape volume, in the format YYYY-MM-DD.

Source: Object access method (OAM)

System Action: None.

CBR1250I OAM XCF status:

Explanation: The operator has entered the following command:

```
DISPLAY SMS,OAMXCF
```

A display of OAM status pertaining to XCF information has been generated. There will be one data line for each instance of OAM in the OAMPLEX.

```
XCF MEMBER NAME   USER              SYSTEM    OPT    OPT    TAPE
                  STATE              NAME     READ   WRITE  READ
xcf-member-name   aaaaaaaaaaaaaaaa  bbbbbbbb  ccccc  ddddd  eeeee
this-xcf-member   ffffffffffffffff  gggggggg  hhhhh  iiiii  jjjjj
XCMODIFY GROUP NAME:  xcf-group-name
```

- OAM XCF timeout value for XCFOPTREADA is *seconds*
- OAM XCF timeout value for XCFOPTREADM is *seconds*
- OAM XCF timeout value for XCFOPTWRITEA is *seconds*
- OAM XCF timeout value for XCFOPTWRITEM is *seconds*
- OAM XCF timeout value for XCFTAPEREADA is *seconds*
- OAM XCF timeout value for XCFTAPEREADM is *seconds*

The operator has entered the following command:

```
DISPLAY SMS,OAMXCF
```

A display of OAM status pertaining to XCF information has been generated. There will be one data line for each instance of OAM in the OAMPLEX.

For instances of OAM other than the OAM on the system where the display command was issued, the fields displayed in the first set of data lines of the multi-line message are as follows:

xcf-member-name The member name associated with an instance of OAM in the OAMPLEX.

aaaaaaaaaaaaaaaa User state of *xcf-member-name* on this data line. OAM defined user states are INITIALIZING, TERMINATING, RESTARTING, or ACTIVE.

bbbbbbbb System name associated with *xcf-member-name* on this data line.

ccccc The number of optical reads shipped from the instance of OAM where the display was issued to the instance of OAM on the data line of the multi-line WTO.

ddddd The number of optical writes shipped from the instance of OAM where the display was issued to the instance of OAM on the data line of the multi-line WTO.

eeeee The number of tape reads shipped from the instance of OAM where the display was issued to the instance of OAM on the data line of the multi-line WTO.

For instances of OAM on the system where the display command was issued, the fields displayed in the last data line of the multi-line message are as follows:

this-xcf-member The member name associated with this instance of OAM in the OAMPLEX where the display command was issued.

ffffffffffffffff User state of *this-xcf-member* where the command was issued. OAM defined user states are INITIALIZING, TERMINATING, RESTARTING, or ACTIVE.

gggggggg System name associated with *xcf-member-name* on this data line.

hhhhh The total number of optical reads shipped from the instance of OAM where the display was issued to other instances of OAM in the OAMPLEX.

iiiii The total number of optical writes shipped from the instance of OAM where the display was issued to other instances of OAM in the OAMPLEX.

jjjjj The total number of tape reads shipped from the instance of OAM where the display was issued to other instances of OAM in the OAMPLEX.

The XCF group associated with the OAMPLEX is *xcf-group-name*.

The OAM XCF timeout values, *seconds*, for each XCFTIMEOUT sub parameter (specified in the CBROAMxx member of PARMLIB when OAM was initialized, or set by operator command) currently in effect for the OAM where the command was entered are displayed.

Source: Object access method (OAM)

System Action: None.

CBR1300I LABEL rejected. No *media-type* drive defined.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,LABEL,media-type
```

or

```
MODIFY OAM,LABEL,media-type,p-library
```

There are no stand-alone/operator accessible optical drives of media type *media-type* defined in the optical configuration database or, if a pseudo library was specified, there are no standalone/operator accessible optical drives of media type *media-type* associated with the specific pseudo library *p-library*.

Source: Object access method (OAM)

System Action: The command is rejected.

CBR1301I LABEL rejected. No *media-type* drive usable.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,LABEL,media-type
```

or

```
MODIFY OAM,LABEL,media-type,p-library
```

All stand-alone/operator accessible optical drives of media type *media-type* in the configuration are either offline or not operational. Or, if a pseudo library name was specified in the command, either:

- All usable stand-alone/operator accessible optical drives of media type *media-type* defined to pseudo library *p-library* are offline, pending offline, or not operational, or
- There are no stand-alone/operator accessible optical drives of media type *media-type* defined to pseudo library *p-library*.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Use the DISPLAY SMS,DRIVE command to display drive status. If there is a stand-alone/operator accessible drive which is currently offline, use the VARY SMS,DRIVE command to VARY it online, then reenter the LABEL command. If all stand-alone/operator accessible drives are not operational, contact a service representative.

If there are no drives that support the requested media type defined to a specified pseudo library, issue the command again, directing it to a pseudo library with drives that are capable of handling the request.

CBR1302I LABEL rejected. Optical disk drive *drive-name* is not defined in the active SMS configuration.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,LABEL,drive-name
```

Optical disk drive *drive-name* is not defined in the active SMS configuration. The command cannot be completed.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Check the name provided in *drive-name* for spelling correctness. Reissue the command with the correct name of a valid drive that is defined in the "ACTIVE" SCDS configuration.

CBR1303I LABEL rejected. Optical disk drive *drive-name* is library-resident.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,LABEL,drive-name
```

Optical disk drive *drive-name* is a library-resident drive. The command cannot be completed.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Select a valid drive name for a non-library resident drive. This drive name must be a valid name for a operator accessible drive in the "ACTIVE" SCDS configuration.

CBR1304I LABEL rejected. Optical disk drive *drive-name* is {offline | pending offline | not operational}.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,LABEL,drive-name
```

The stand-alone/operator accessible optical drive *drive-name* is either offline, pending offline, or not operational.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Use the DISPLAY SMS,DRIVE command to display drive status. If the stand-alone/operator accessible drive is currently offline or pending offline, use the VARY SMS,DRIVE command to VARY it online, then reissue the LABEL command. If the stand-alone/operator accessible drive is not operational, vary the drive offline then back online and reissue the LABEL command. If the problem reoccurs, contact a service representative.

CBR1305I LABEL rejected. Pseudo library name *p-library* is not defined in the active SMS configuration.

Explanation: The operator has entered a command of the form:

MODIFY OAM,LABEL,*media-type*,*p-library*

Pseudo library *p-library* is not defined in the active SMS configuration. The command cannot be completed.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Check the name provided in *p-library* for spelling correctness. Reissue the command with the correct name of a valid pseudo library that is defined in the "ACTIVE" SCDS configuration.

CBR1306I RELABEL not allowed for volume *old_volser*. {Write protected| Eject requested| Duplicate request| Reformat requested| Object Backup volume| Write scheduled| Active write found| DB2 volume table error| DB2 object directory table error| Reinit scheduled| LMSI media}.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,{RELABEL|RL},old_volser,new_volser
[,drive name]
```

to rename the volume serial number for an optical disk volume previously defined to OAM. The attempt has failed. The reason for the failure is one of the following:

Write protected The volume is currently set to write protected.

Eject requested A volume eject has been requested for the volume.

Duplicate request The volume relabel has already been requested for the volume.

Reformat requested A volume reformat has been requested for the volume.

Object Backup volume The volume is an Object Backup volume.

Write scheduled Objects are scheduled to be written on this volume.

Active Object found Unexpired objects are found on this volume.

DB2 Volume table error An attempt to delete, update, or insert rows of DB2 Volume Table failed. Refer to the previous error message for details of this error.

DB2 Object Directory table error An error occurred when accessing the DB2 Object Directory table. Refer to the previous error message for details of this error.

Reinit scheduled A volume reinitialization has been scheduled by OSMC.

LMSI media The volume is a LMSI volume.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Check the volume serial number provided in *old_volser* for correctness and reissue the RELABEL command.

CBR1307I LABEL rejected. Library *p-library* is not a pseudo optical library.

Explanation: The operator has entered a command of the form:

MODIFY OAM,LABEL,*media-type*,*p-library*

Library *p-library* is not a pseudo optical library. The command cannot be completed.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Library *p-library* is a real optical library or controller. Reissue the command with the correct name of a valid pseudo optical library that is defined in the active SMS configuration (ACDS).

CBR1308I RELABEL volume *old_volser* rejected. Optical disk drive *drive-name* is {offline | pending offline | not operational| library resident|write protected}.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,{RELABEL|RL},old_volser,new_volser
[,drive name]
```

The operator accessible optical drive *drive-name* is either offline, pending offline, not operational, library resident or write protected.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Use the DISPLAY SMS,DRIVE command to display drive status.

If the operator accessible drive is currently offline or pending offline, use the VARY SMS,DRIVE command to VARY it online, then reissue the command. If the operator accessible drive is not operational, vary the drive offline then back online and reissue the command. If the problem reoccurs, contact a service representative.

If the drive is library resident or write protected, select another operator accessible drive.

CBR1309I {RELABEL|RL} rejected. {No usable drive| Invalid old volume serial number }

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,{RELABEL|RL},old_volser,new_volser
[,drive_name]
```

to rename the volume serial number for an optical disk volume previously defined to OAM. The request is rejected. The reason is one of the following:

No usable drive All optical drives capable of processing the requested volume in the configuration are either offline or not operational.

Invalid old volume serial number The *old_volser* entered is not a valid MVS volume serial number.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: For no usable drive, use the DISPLAY SMS,DRIVE command to display drive status. If there is a write-compatible optical drive for the requested optical disk volume and it is currently offline, use the VARY SMS,DRIVE command to VARY it online, then reissue the RELABEL command. If all write-compatible optical drives for the requested volume are not operational, contact a service representative.

For invalid old volume serial number, check the old volume serial number *old_volser* for correctness and reissue the command.

CBR1310I Label rejected. Library *libname* in remap mode; no other drives capable.

Explanation: A label request failed because the library is currently being remapped, or a remap is pending for the library. No drives are capable of satisfying the request.

Source: Object access method (OAM)

System Action: Label rejected, remap continues.

Operator Response: Resubmit the label request when the library remap is completed.

CBR1311I Unable to {connect|disconnect} DB2 Object Directory database. RC = *return-code*. Relabel terminated.

Explanation: An error occurred attempting to access DB2 Object Directory Database. The error code from DB2 is *return-code*.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Notify database administrator.

CBR1312I RELABEL volume *old_volser* rejected. New volume serial number *new_volser* is invalid.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,{RELABEL|RL},old_volser,new_volser
[,drive_name]
```

The *new_volser* entered is not a valid MVS volume serial number.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Check the new volume serial number *new_volser* for correctness. Reissue the command.

CBR1313I RELABEL volume *old_volser* rejected. New VOLSER *new_volser* already exists. Duplicate {optical|tape|DASD} volume.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,{RELABEL|RL},old volser,new volser
[,drive name]
```

The new volume serial number *new_volser* supplied already exists in the DB2 Volume Table, the Tape Configuration Database (TCDB) or on a DASD volume.

Source: Object access method (OAM)

System Action: OAM fails the volume relabel request.

Operator Response: Resubmit the relabel command with an unused volume serial number.

CBR1314I The specified drive *drive-name* for RELABEL is ignored. Volume *old_volser* is library resident.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,{RELABEL|RL},old_volser,new_volser
[,drive_name]
```

to rename the volume serial number for an optical disk volume previously defined to OAM. The requested volume *old_volser* is inside a 3995 optical library. The specified optical drive *drive_name* is ignored.

Source: Object access method (OAM)

System Action: OAM selects a library drive to process the request.

CBR1400I STOP rejected. Component name *name* invalid.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,STOP,name
```

The name of the component *name* to be stopped is invalid. It must be OAM, OSMC, or STORGRP.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a STOP command with the correct component name.

CBR1500I START rejected. Component name *name* invalid.

Explanation: The operator has entered a command of the form:

```
MODIFY OAM,START,name
```

The name of the component *name* to be started is invalid. It must be OSMC, LIBMGT, RECOVERY, STORGRP, DASDSM, or OBJRECV.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a START command with the correct component name.

CBR1600I VARY rejected. Drive or library name *name* undefined.

Explanation: The operator has entered a command of one of the following forms:

```
VARY SMS,LIBRARY(name),status
VARY SMS,DRIVE(name),status
```

The library name specified in the command is not defined in the optical configuration database or the tape configuration database, a library, or the drive name specified in the command is not defined in the optical configuration database as a drive.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a VARY command with a valid drive or library name.

CBR1601I VARY rejected. Status *status* invalid.

Explanation: The operator has entered a command of one of the following forms:

```
VARY SMS,LIBRARY(name),status
VARY SMS,DRIVE(name),status
```

The status *status* operand is neither ONLINE nor OFFLINE.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Determine the cause of the error, then enter a VARY command with the correct status operand.

CBR1602I Drive *drive-name* already *status*.

Explanation: The operator has entered a command of the form:

```
VARY SMS,DRIVE(drive-name),status
```

The specified drive *drive-name* already has the requested status *status*.

Source: Object access method (OAM)

System Action: The command is not implemented.

CBR1603I Library *library-name* already *status*.

Explanation: The operator has entered a command of the form:

```
VARY SMS,LIBRARY(library-name)status
```

The specified library *library-name* already has the requested status *status*.

Source: Object access method (OAM)

System Action: The command is not implemented.

CBR1604I VARY rejected. Cannot demount volume on drive *drive-name*.

Explanation: The operator has entered a command of the form:

```
VARY SMS,DRIVE(drive-name),OFFLINE
```

A volume is currently mounted on drive *drive-name*, which is attached to a library, and the library is either offline or not operational.

Source: Object access method (OAM)

System Action: The command is rejected. The drive is left in pending offline status; no new work will be scheduled to the drive.

Operator Response: If the library is offline, VARY it online, then reenter the VARY command. If the library is not operational, contact a service representative.

CBR1605I VARY rejected for {LIBRARY|DRIVE} *lib-drv-1*. Associated resource {LIBRARY|DRIVE} *lib-drv-2* currently being controlled by *member-name* instance of OAM.

Explanation: The operator has entered one of the following commands:

VARY SMS,DRIVE(*lib-drv-1*),ONLINE
VARY SMS,LIBRARY(*lib-drv-1*),ONLINE

The request to vary library or drive *lib-drv-1* online cannot be executed because an associated library or drive *lib-drv-2* is already online to another instance OAM in the OAMPLEX, *member-name*.

Communications to optical libraries are accomplished through the controller (defined in the controlling library field in the library definitions). Communications for optical libraries and drives with the same controlling library must be done from the same system. So, an optical device cannot be brought online to a system if:

- Any drive in the same library is online to another instance of OAM.
- An associated library (e.g., an expansion unit or controller) is online to another instance of OAM.
- Any drive in an associated library is online to another instance of OAM.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: If the library or drive must be brought online to this OAM, vary the library or drive that is online to another OAM offline to that OAM. When no associated resources are online to other instances of OAM in the OAMPLEX, vary the library or drive online to this OAM.

If the library or drive may be brought online to any OAM, issue the VARY command to bring the library or drive online to the same instance of OAM where the associated resource is currently being controlled.

CBR1610I Drive *drive-name* in library *library-name* online and operational.

Explanation: The operator has entered a command of the form:

```
VARY SMS,LIBRARY(library-name),OFFLINE
```

The named drive *drive-name*, and possibly other drives as well, is attached to the specified library *library-name* and is both online and operational.

Source: Object access method (OAM)

System Action: Message CBR1611D is issued. In the response, the operator may confirm or cancel the VARY offline request.

Operator Response: Wait until message CBR1611D is issued, then respond as directed in the description of that message.

CBR1611D Reply 'U' to VARY library *library-name* OFFLINE, 'C' to cancel.

Explanation: The operator has entered a command of the form:

```
VARY SMS, LIBRARY(library-name),OFFLINE
```

Message CBR1610I has been issued. Before allowing the named library *library-name* to be varied offline, OAM requires operator con-

firmation of the vary offline request because there is at least one drive online in the library.

Source: Object access method (OAM)

System Action: The OAM operator command processing component waits for a response from the operator.

Operator Response: Reply 'U' to confirm the VARY offline request, 'C' to cancel it.

CBR1612I VARY library *library-name* **OFFLINE command canceled.**

Explanation: The operator has entered a command of the form:

```
VARY SMS,LIBRARY(library-name),OFFLINE
```

Messages CBR1610I and CBR1611D have been issued. The operator responded 'C' to message CBR1611D, thereby refusing to confirm the VARY library *library-name* offline request.

Source: Object access method (OAM)

System Action: The VARY command is canceled.

CBR1620I Requesting SVC dump for OAM address space.

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,DUMP
MODIFY OAM,DUMP,OAM
```

An SVC dump has been requested for the OAM address space.

Source: Object access method (OAM)

System Action: After the command is executed, an SVC dump will be available in a system dump dataset.

CBR1621I Requesting SVC dump for OAM address space and ASIDs *asid1 asid2 asid3 asid4 asid5 asid6 asid7 asid8 asid9 asid10 asid11 asid12 asid13 asid14*

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,DUMP,ASID,asid1,asid2.asid3,....asid14
MODIFY OAM,DUMP,ALL
```

An SVC dump has been requested for the OAM address space and the specified address spaces, or the address spaces that currently have worked queued in the OAM address space.

Source: Object access method (OAM)

System Action: After the command is executed, an SVC dump will be available in a system dump dataset.

CBR1622I Requesting SVC dump for OAM address space and job names *jobn1 jobn2 jobn3 jobn4 jobn5 jobn6 jobn7 jobn8 jobn9 jobn10 jobn11 jobn12 jobn13 jobn14*

Explanation: The operator has entered the following command:

```
MODIFY OAM,DUMP,JOBN,jobn1,jobn2,jobn3,....jobn14
```

An SVC dump has been requested for the OAM address space and the specified job names.

Source: Object access method (OAM)

System Action: After the command is executed, an SVC dump will be available in a system dump dataset.

CBR1623I SVC dump processing completed successfully.

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,DUMP
MODIFY OAM,DUMP,OAM
MODIFY OAM,DUMP,ALL
MODIFY OAM,DUMP,ASID,xxxx,yyyy,zzzz,...
MODIFY OAM,DUMP,JOBN,xxxxxxxx,yyyyyyyy,zzzzzzzz,...
```

An SVC dump has been requested for the OAM address space and the specified address spaces, job names, or address spaces that currently have worked queued in the OAM address space. The SVC dump capture phase has completed successfully.

Source: Object access method (OAM)

System Action: An SVC dump will be available in a system dump dataset.

CBR1624I SVC dump processing completed unsuccessfully, return code = *return-code***, reason code =** *reason-code***.**

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,DUMP
MODIFY OAM,DUMP,OAM
MODIFY OAM,DUMP,ALL
MODIFY OAM,DUMP,ASID,xxxx,yyyy,zzzz,...
MODIFY OAM,DUMP,JOBN,xxxxxxxx,yyyyyyyy,zzzzzzzz,...
```

An SVC dump was requested, however, the dump processing returned with a return code 08. The *return-code* and *reason-code* are the return and reason codes returned from SDUMPX.

Source: Object access method (OAM)

System Action: An SVC dump will be available in a system dump dataset.

CBR1625I SVC dump processing completed, not all data could be captured.

Explanation: The operator has entered a command of one of the following forms:

```
MODIFY OAM,DUMP
MODIFY OAM,DUMP,OAM
MODIFY OAM,DUMP,ALL
MODIFY OAM,DUMP,ASID,xxxx,yyyy,zzzz,...
MODIFY OAM,DUMP,JOBN,xxxxxxxx,yyyyyyyy,zzzzzzzz,...
```

An SVC dump was requested, however, the dump processing returned with a return code 04. Some of the data could not be captured, or could not be written to the dump data set. The reason code is contained in message IEA911E.

Source: Object access method (OAM)

System Action: A partial dump will be available in a system dump dataset.

CBR1626I DUMP command execution failed. Invalid address space identifier (ASID) specified with the ASID operand. Invalid ASID = *asid***.**

Explanation: The operator has entered the following command:

```
MODIFY OAM,DUMP,ASID,xxxx,yyyy,zzzz,...
```

The ASID *asid* contains non-hexadecimal characters or is longer than 4 characters.

Source: Object access method (OAM)

System Action: The command cannot be completed.

Operator Response: Check the ASID values and reissue the failing command.

CBR1627I DUMP command execution failed. Invalid job name specified with the JOBN operand. Invalid job name = *jobname*.

Explanation: The operator has entered the following command:

```
MODIFY OAM,DUMP,JOBN,xxxxxxxx,yyyyyyyy,zzzzzzzz,...
```

The job name *jobn* contains invalid characters. The valid character set for job names are alphanumeric, national ($, #, @), and wild card (*, ?) characters.

Source: Object access method (OAM)

System Action: The command cannot be completed.

Operator Response: Check the job name values and reissue the failing command.

CBR1628I More than 14 ASIDs or job names specified on DUMP command, the first 14 will be included.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,DUMP,ASID,xxxx,yyyy,zzzz,...
MODIFY OAM,DUMP,JOBN,xxxxxxxx,yyyyyyyy,zzzzzzzz,...
```

More than 14 ASIDs or job names were specified. Up to 15 address spaces or jobs can be dumped in one invocation of SDUMPX. With the OAM address space, only 14 additional address spaces can be scheduled in a single command.

Source: Object access method (OAM)

System Action: An SVC dump will be scheduled for the OAM address space and the first 14 ASIDs or job names specified on the command. The remaining ASIDs or job names will be ignored.

Operator Response: Reissue the MODIFY OAM DUMP command with the extra ASIDs or job names, if these are required.

CBR1650I Optical volume record for volume *volser* updated.

Explanation: The operator has entered a volume update command for an optical volume:

```
MODIFY OAM,UPDATE,VOLUME,volser....
```

The volume record in the DB2 optical volume table and the OAM control block have been updated for volume *volser*

Source: Object Access Method (OAM)

System Action: OAM processing continues using the new updated values.

CBR1651I Tape volume record for volume *volser* updated.

Explanation: The operator has entered a volume update command for an object tape volume:

```
MODIFY OAM,UPDATE,VOLUME,volser....
```

The volume record in the DB2 TAPEVOL table and the OAM control block have been updated for volume *volser*

Source: Object Access Method (OAM)

System Action: OAM processing continues using the new updated values

---

CBR1700I Optical waiting sum:

Explanation:

```
------ OPTICAL REQUESTS WAITING FOR PROCESSING -------
 READS  WRITES DELETES  ENTERS  EJECTS  AUDITS LABELS
aaaaaa  bbbbbb  cccccc  dddddd  eeeeee  ffffff gggggg
```

The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING
MODIFY OAM,QUERY,WAITING,SUMMARY
```

A display of work requests waiting for execution in the OAM address space is generated. The fields displayed in the data line of the multi-line message are as follows:

aaaaaa Total number of object read requests from an optical volume waiting to be processed. This includes read requests waiting to be processed on this system that originated from another instance of OAM in the OAMPLEX or read requests originated by this system, waiting to be processed by another instance of OAM in the OAMPLEX

bbbbbb Total number of object write requests to an optical volume waiting to be processed. This includes write requests waiting to be processed on this system that originated from another instance of OAM in the OAMPLEX or write requests originated by this system, waiting to be processed by another instance of OAM in the OAMPLEX.

cccccc Total number of object delete requests from an optical volume waiting to be processed.

dddddd Total number of optical volume enter requests waiting to be processed.

eeeeee Total number of optical volume eject requests waiting to be processed. This number also includes system initiated ejects.

ffffff Total number of optical volume audit requests waiting to be processed.

gggggg Total number of optical cartridge label requests waiting to be processed.

Note: All counts above are a snapshot in time count and the numbers can change quickly.

CBR1709I Unrecognized operand on query command, operand = *operand*.

Explanation: The operator tried to entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE
MODIFY OAM,QUERY,WAITING
MODIFY OAM,QUERY,ACTIVE,SUMMARY
MODIFY OAM,QUERY,WAITING,SUMMARY
MODIFY OAM,QUERY,ACTIVE,DETAIL,READ
MODIFY OAM,QUERY,ACTIVE,DETAIL,WRITE
MODIFY OAM,QUERY,ACTIVE,DETAIL,DELETE
MODIFY OAM,QUERY,ACTIVE,DETAIL,EJECT
MODIFY OAM,QUERY,ACTIVE,DETAIL,ENTER
MODIFY OAM,QUERY,ACTIVE,DETAIL,AUDIT
MODIFY OAM,QUERY,ACTIVE,DETAIL,LABEL
MODIFY OAM,QUERY,ACTIVE,DETAIL,REMAP
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,READ
MODIFY OAM,QUERY,WAITING,DETAIL,WRITE
MODIFY OAM,QUERY,WAITING,DETAIL,EJECT
MODIFY OAM,QUERY,WAITING,DETAIL,ENTER
MODIFY OAM,QUERY,WAITING,DETAIL,AUDIT
MODIFY OAM,QUERY,WAITING,DETAIL,LABEL
MODIFY OAM,QUERY,WAITING,DETAIL,REMAP
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
```

The operand entered was *operand*.

Operator Response: Enter the command again with the correct syntax.

CBR1710I Tape Object waiting sum:

Explanation:

```
---- OBJECT TAPE REQUESTS WAITING FOR PROCESSING ----
READS   WRITES
aaaaaa  bbbbbb
```

The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING
MODIFY OAM,QUERY,WAITING,SUMMARY
```

A display of work requests waiting for execution in the OAM address space is generated. The fields displayed in the data line of the multi-line message are as follows:

aaaaaa Total number of object read requests from a tape volume waiting to be processed. This includes read requests waiting to be processed on this system that originated from another instance of OAM in the OAMPLEX or read requests originated by this system, waiting to be processed by another instance of OAM in the OAMPLEX.

bbbbbb Total number of object write requests to a tape volume waiting to be processed.

Note: All counts above are a snapshot in time count and the numbers can change quickly.

CBR1715I Tape Lib waiting sum:

Explanation:

```
---- TAPE LIBRARY REQUESTS WAITING FOR PROCESSING ----
ENTERS  EJECTS  AUDITS
aaaaaa  bbbbbb  cccccc
```

The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING
MODIFY OAM,QUERY,WAITING,SUMMARY
```

A display of work requests waiting for execution in the OAM address space is generated. The fields displayed in the data line of the multi-line message are as follows:

aaaaaa Total number of tape volume enter requests waiting to be processed. This is a count of the total number of volumes currently in the library manager insert category that OAM knows about and is waiting to process. If OAM has not received the attention interrupt signalling the addition of cartridges to the insert category, the entered volumes will not be included in the summary count even though they have physically been entered into a library.

bbbbbb Total number of user initiated tape volume eject requests waiting to be processed in the OAM address space that have not yet been sent to the library manager.

cccccc Total number of tape volume audit requests waiting to be processed in the OAM address space that have not yet been sent to the library manager.

Note: All counts above are a snapshot in time count and the numbers can change quickly.

CBR1720I Optical active sum:

Explanation:

```
----- OPTICAL REQUESTS CURRENTLY BEING PROCESSED -----
 READS  WRITES DELETES  ENTERS  EJECTS  AUDITS LABELS
aaaaaa  bbbbbb  cccccc  dddddd  eeeeee  ffffff gggggg
```

The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE
MODIFY OAM,QUERY,ACTIVE,SUMMARY
```

A display of optical work requests currently being processed by the OAM address space is generated. The fields displayed in the data line of the multi-line message are as follows:

aaaaaa Total number of object read requests from an optical volume currently being processed. This includes read requests being processed on this system that originated from another instance of OAM in an OAMPLEX.

bbbbbb Total number of object write requests to an optical volume currently being processed. This includes write requests being processed on this system that originated from another instance of OAM in an OAMPLEX.

cccccc Total number of object delete requests from an optical volume currently being processed.

dddddd Total number of optical volume enter requests currently being processed.

eeeeee Total number of optical volume eject requests currently being processed. This number also includes system initiated ejects.

ffffff Total number of optical volume audit requests currently being processed.

gggggg Total number of optical cartridge label requests currently being processed.

Note: All counts above are a snapshot in time count and the numbers can change quickly.

CBR1730I Tape object active sum:

Explanation:

```
---- OBJECT TAPE REQUESTS CURRENTLY BEING PROCESSED ----
READS   WRITES
aaaaaa  bbbbbb
```

The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE
MODIFY OAM,QUERY,ACTIVE,SUMMARY
```

A display of tape work requests currently being processed in the OAM address space is generated. The fields displayed in the data line of the multi-line message are as follows:

aaaaaa Total number of object read requests from a tape volume currently being processed. This includes read requests being processed on this system that originated from another instance of OAM in an OAMPLEX.

bbbbbb Total number of object write requests to a tape volume currently being processed.

Note: All counts above are a snapshot in time count and the numbers can change quickly.

CBR1735I Tape Lib active sum:

Explanation:

```
---- TAPE LIBRARY REQUESTS CURRENTLY BEING PROCESSED ----
ENTERS  EJECTS  AUDITS
aaaaaa  bbbbbb  cccccc
```

The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE
MODIFY OAM,QUERY,ACTIVE,SUMMARY
```

A display of tape work requests currently being processed in the OAM address space is generated. The fields displayed in the data line of the multi-line message are as follows:

aaaaaa Total number of tape volume entry requests currently being processed. At most, only one tape volume entry request can be active per library.

bbbbbb Total number of user initiated tape volume eject requests currently being processed and/or queued at the library manager. Volumes that have physically been ejected from

the library can still appear in this count if OAM has not processed the eject completion message.

cccccc Total number of tape volume audit requests currently being processed and/or queued at the library manager.

Note: All counts above are a snapshot in time count and the numbers can change quickly.

CBR1740I REMAP request for optical library *library-name*, **user** *userid*, **waiting to be processed, request =** *request*

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,REMAP
```

A REMAP request for optical library *library-name* for user *userid* is waiting to be processed. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1741I REMAP request for optical library *library-name*, **user** *userid*, **in process, request =** *request*

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,REMAP
```

A REMAP request for optical library *library-name*, for user *userid*, is currently being processed. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1742I *count* **active requests found.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,READ
MODIFY OAM,QUERY,ACTIVE,DETAIL,WRITE
MODIFY OAM,QUERY,ACTIVE,DETAIL,DELETE
MODIFY OAM,QUERY,ACTIVE,DETAIL,EJECT
MODIFY OAM,QUERY,ACTIVE,DETAIL,ENTER
MODIFY OAM,QUERY,ACTIVE,DETAIL,AUDIT
MODIFY OAM,QUERY,ACTIVE,DETAIL,REMAP
```

This message displays the number, *count*, of active requests found by OAM during the processing of the command.

CBR1743I *count* **waiting requests found.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,READ
MODIFY OAM,QUERY,WAITING,DETAIL,WRITE
MODIFY OAM,QUERY,WAITING,DETAIL,EJECT
MODIFY OAM,QUERY,WAITING,DETAIL,ENTER
MODIFY OAM,QUERY,WAITING,DETAIL,AUDIT
MODIFY OAM,QUERY,WAITING,DETAIL,REMAP
```

This message displays the number, *count*, of waiting requests found by OAM during the processing of the command.

CBR1750I Reading object *object-name*, **in collection** *collection-name*, **from optical volume** *volser*, **in library** *lib-name*, **offset =** *offset*, **length =** *length*, **request =** *request*, **source =** *source-member*, **target =** *target-member*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,READ
```

A read request for an OAM object from an optical volume *volser*, in library *lib-name*, is currently being processed. The object name is *object-name*, in collection *collection-name*. The object's length is *length* and offset is *offset*. The request number associated with this request is *request*.

The originating instance of OAM that initiated this request is *source-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX. The target instance of OAM where this request is to be processed is *target-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX.

Note: This message is issued to the hardcopy log only.

CBR1751I Writing object *object-name*, **in collection** *collection-name*, **to optical volume** *volser*, **in library** *lib-name*, **length =** *length*, **request =** *request*, **source =** *source-member*, **target =** *target-member*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,WRITE
```

A write request for an OAM object to an optical volume *volser*, in library *lib-name*, is currently being processed. The object name is *object-name*, in collection *collection-name*., and the length is *length*. The request number associated with this request is *request*.

The originating instance of OAM that initiated this request is *source-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX. The target instance of OAM where this request is to be processed is *target-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX.

Note: This message is issued to the hardcopy log only.

CBR1752I Deleting object *object-name*, **in collection** *collection-name*, **from optical volume** *volser*, **in library** *lib-name*, **length =** *length*, **request =** *request*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,DELETE
```

A delete request for an OAM object from an optical volume *volser*, in library *lib-name*, is currently being processed. The object name is *object-name*, in collection *collection-name*. The objects length is *length*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1753I Auditing optical volume *volser*, **in library** *lib-name*, **for user** *userid*, **request =** *request*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,AUDIT
```

An audit request for an optical disk volume *volser* is currently being processed in library *lib-name* for user *userid*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1754I Ejecting optical volumes *volser-A* **and** *volser-B* **from library** *lib-name*, **for user** *userid*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,EJECT
```

An eject request for an optical disk cartridge is currently being processed from library *lib-name* for user *userid*. The volumes are *volser-A* and *volser-B*. This number includes both system and user initiated ejects.

Note: This message is issued to the hardcopy log only.

CBR1755I Optical cartridge entry request in process on optical drive *drive-name*, **in library** *lib-name*, **request =** *request*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,ENTRY
```

An optical cartridge entry request is currently being processed on optical drive *drive-name* in in library *lib-name*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1756I Optical cartridge label request in process on optical drive *drive-name*, **request =** *request*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,LABEL
```

An optical cartridge label request is currently being processed on drive *drive-name*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1760I Read request for object *object-name*, **in collection** *collection-name*, **from optical volume** *volser*, **in library** *lib-name*, **offset =** *offset*, **length =** *length*, **waiting to be processed, request =** *request*, **source =** *source-member*, **target =** *target-member*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,READ
```

A read request for an OAM object from an optical volume *volser*, in library *lib-name*, is waiting to be processed. The object name is *object-name*, in collection *collection-name*. The objects length is *length* and offset is *offset*. The request number associated with this request is *request*.

The originating instance of OAM that initiated this request is *source-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX. The target instance of OAM where this request is to be processed is *target-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX.

Note: This message is issued to the hardcopy log only.

CBR1761I Write request for object *object-name*, **in collection** *collection-name*, **to {volume | storage group | library}** *name*, **waiting to be processed, length =** *length*, **request =** *request*, **source =** *source-member*, **target =** *target-member*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,WRITE
```

A write request for an OAM object to an optical volume *volser*, in library *lib-name*, is waiting to be processed. The object name is *object-name*, in collection *collection-name*. The objects length is *length*. The request number associated with this request is *request*.

The originating instance of OAM that initiated this request is *source-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX. The target instance of OAM where this request is to be processed is *target-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX.

Note: This message is issued to the hardcopy log only.

CBR1763I Audit request for optical volume *volser*, **in library** *lib-name*, **for user** *userid*, **waiting to be processed, request =** *request*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,AUDIT
```

A audit request for an optical disk volume *volser* is waiting to be processed in library *lib-name* for user *userid*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1764I Eject request for optical volumes *volser-A* **and** *volser-B*, **in library** *lib-name*, **for user** *userid*, **waiting to be processed.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,EJECT
```

An eject request for an optical disk cartridge is waiting to be processed in library *lib-name* for user *userid*. The volumes are *volser-A* and *volser-B*. This number includes both system and user initiated ejects.

Note: This message is issued to the hardcopy log only.

CBR1765I Optical cartridge entry request for optical library *lib-name*, **waiting to be processed, request =** *request*.

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,ENTRY
```

An entry request for an optical disk cartridge is waiting to be processed in library *lib-name*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1766I Optical cartridge label request for keyword *keyword* **waiting to be processed, request =** *request***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,LABEL
```

A label request for an optical disk cartridge is waiting to be processed. The request number associated with this request is *request*.

keyword is the keyword that was specified on the MODIFY OAM,LABEL,*keyword* operator command that initiated this request.

Note: This message is issued to the hardcopy log only.

CBR1767I Optical cartridge label request for drive *drive-name* **waiting to be processed, request =** *request***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,LABEL
```

A label request for an optical disk cartridge is waiting to be processed on drive *drive-name*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1770I Reading object *object-name***, in collection** *collection-name***, from tape volume** *volser***, offset =** *offset***, length =** *length***, request =** *request***, source =** *source-member***, target =** *target-member***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,READ
```

A read request for an OAM object from a tape volume *volser*, is currently being processed. The object name is *object-name*, in collection *collection-name*. The objects length is *length* and offset is *offset*. The request number associated with this request is *request*.

The originating instance of OAM that initiated this request is *source-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX. The target instance of OAM where this request is to be processed is *target-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX.

Note: This message is issued to the hardcopy log only.

CBR1771I Writing object *object-name***, in collection** *collection-name***, to tape volume** *volser***, length =** *length***, request =** *request***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,WRITE
```

A write request for an OAM object to a tape volume *volser*, is currently being processed. The object name is *object-name*, in collection *collection-name*. The objects length is *length*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1773I Auditing tape volume *volser***, in library** *lib-name***, for user** *userid***, request =** *request***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,AUDIT
```

An audit request for a tape volume *volser* is currently being processed in library *lib-name* for user *userid*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1774I Ejecting tape volume *volser***, from library** *lib-name***, for user** *userid***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,EJECT
```

An eject request for a tape volume *volser* is currently being processed from library *lib-name* for user *userid*. This request could be system or user initiated.

Note: This message is issued to the hardcopy log only.

CBR1775I Tape cartridge entry request in process on library *lib-name***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,ACTIVE,DETAIL,ALL
MODIFY OAM,QUERY,ACTIVE,DETAIL,ENTRY
```

Tape cartridge entry processing is currently in process for tape library *lib-name*.

Note: This message is issued to the hardcopy log only.

CBR1780I Read request for object *object-name***, in collection** *collection-name***, from tape volume** *volser* **offset =** *offset***, length =** *length* **waiting to be processed, request =** *request***, source =** *source-member***, target =** *target-member***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,READ
```

A read request for an OAM object from a tape volume *volser* is waiting to be processed. The object name is *object-name*, in collection *collection-name*. The objects length is *length* and offset is *offset*. The request number associated with this request is *request*.

The originating instance of OAM that initiated this request is *source-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX. The target instance of OAM where this request is to be processed is *target-member* or '-N/A-' if this instance of OAM is not in an OAMPLEX.

Note: This message is issued to the hardcopy log only.

CBR1781I Write request for object *object-name***, in collection** *collection-name***, to tape in storage group** *sg-name* **waiting to be processed, length =** *length***, request =** *request***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,WRITE
```

A write request for an OAM object to a tape volume *volser*, in storage group *sg-name*, is waiting to be processed. The object name is *object-name*, in collection *collection-name*. The objects length is *length*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1783I Audit request for tape volume *volser***, in library** *lib-name***, for user** *userid***, waiting to be processed, request =** *request***.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,AUDIT
```

A audit request for a tape volume *volser* is waiting to be processed in library *lib-name* for user *userid*. The request number associated with this request is *request*.

Note: This message is issued to the hardcopy log only.

CBR1784I Eject request for tape volume *volser***, in library** *lib-name***, for user** *userid* **waiting to be processed.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,EJECT
```

An eject request for a tape volume *volser* is waiting to be processed in library *lib-name* for user *userid*. This request could be system or user initiated.

Note: This message is issued to the hardcopy log only.

CBR1785I *number* **tape cartridge entry requests for library** *lib-name* **waiting to be processed.**

Explanation: The operator has entered one of the following commands:

```
MODIFY OAM,QUERY,WAITING,DETAIL,ALL
MODIFY OAM,QUERY,WAITING,DETAIL,ENTRY
```

Tape cartridges have been entered into library *lib-name* There are currently *number* entry requests waiting to be processed. This is a count of the number of volumes currently in the library manager insert category that OAM knows about and is waiting to process. If OAM has not received the attention interrupt signalling the addition of cartridges to the insert category, the entered volumes will not be included in the summary count even though they have physically been entered into library.

Note: This message is issued to the hardcopy log only.

CBR1800I *resource-name* **VARY completion notification error. SSI RC =** *SSI-return-code***, SMS RC =** *SMS-return-code***, SMS REASON =** *SMS-reason-code***.**

Explanation: Following completion of VARY command processing for an optical library, an optical drive or a tape library, OAM tried to notify the storage management address space using the Subsystem Interface (SSI). The SSI call failed. The return code from the SSI is given by *SSI-return-code*; the return code from SMS is given by *SMS-return-code*; and the reason code from SMS operational services is given by *SMS-reason-code*. In the message text, *resource-name* is replaced by the name of the optical library or optical drive.

Source: Object access method (OAM)

System Action: OAM continues normal processing. If a system IPL is performed, the online/offline status of the library or drive may not be correct following the IPL.

Operator Response: Repeat the failing VARY command. If the failure persists, notify the system programmer.

System Programmer Response: For information on the SMS return codes and reason codes see *DFSMS/MVS DFSMSdfp Diagnosis Reference*. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR1900I START OAM rejected. OAM address space already active.

Explanation: A request has been made in the storage management address space to start the Object Access Method (OAM) address space, but the OAM address space is already active.

Source: Object access method (OAM)

System Action: The request is rejected.

CBR1910I *verb* **rejected. {OAM address space not started. |OAM1 subsystem not initialized.}**

Explanation: A verb *verb* request has been made through the use of the DISPLAY SMS, VARY SMS, or LIBRARY operator command which requires processing in the object access method (OAM) address space or use of the OAM control block structure. The request is one of the following:

- Display the status of a resource in the OAM address space.
- Vary the online/offline status of an optical library, an optical drive, or a tape library.
- Stop the OAM address space.
- Eject a volume from a library.
- Reset an installation exit so that it may be invoked again.
- Display or set tape device status.
- Initiate an export request.
- Initiate an import request.

Check for one of the following conditions:

- The OAM address space is not active.
- The OAM address space is in the process of starting or stopping.
- The OAM1 subsystem is not initialized.

Source: Object Access Method (OAM)

System Action: The request is rejected.

Operator Response: If OAM1 subsystem is not initialized, check the IEFSSNxx PARMLIB member; OAM1 subsystem should be specified. If the OAM address space is not started, start OAM. Then retry the request.

CBR1920I *verb* **not scheduled. Command scheduling error.**

Explanation: A request has been made in the Storage Management Address Space, or through use of the DISPLAY SMS, VARY SMS, or LIBRARY operator commands, which requires processing in the Object Access Method (OAM) address space. The request is one of the following:

- Start the OAM address space.
- Display the status of a resource in the OAM address space.
- Vary the online/offline status of an optical library, an optical drive, or a tape library.

- Stop the OAM address space.
- Eject a volume from a library.
- Reset an installation exit so that it may be invoked again.
- Set or display the cartridge loader scratch media type.

The attempt to schedule the execution of the command failed.

Source: Object Access Method (OAM)

System Action: The request is not executed.

Operator Response: The command scheduling facility issues its own message describing the error it has detected. If you are able to correct the error, do so; if not, contact the system programmer.

System Programmer Response: Ensure that load modules CBRFCMD and IEECB965 are in an APF-authorized library. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR1930I *verb* **command execution failed.**

Explanation: A request has been made in the Storage Management Address Space which requires the scheduling of a command for processing in the Object Access Method (OAM) address space. The request is one of the following:

- Start the OAM address space.
- Display the status of a resource in the OAM address space.
- Vary the online/offline status of an optical library, an optical drive, or a tape library.
- Stop the OAM address space.

An abnormal end has occurred during the preparation for command scheduling.

Source: Object Access Method (OAM)

System Action: The request may not have been scheduled, depending on when the error occurred.

Operator Response: If a VARY SMS or DISPLAY SMS command has failed, reenter the failing command. If the failure persists, notify the system programmer.

System Programmer Response: If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR1950I Installation exit *exit-name* **has been reset.**

Explanation: The operator has entered the following command:

```
LIBRARY RESET,exit-name
```

The requested installation exit has been reactivated and is now functional.

Source: Object Access Method (OAM)

System Action: If the OAM function controlled by the exit was previously disabled due to an error in the installation exit, the function is now enabled. If the installation exit was not being invoked because it had set the "do not call" return code, the exit is now invoked again as part of normal OAM processing.

CBR1951I Installation exit *exit-name* **{was|has been} disabled by operator command.**

Explanation: The operator has entered the following command:

```
LIBRARY DISABLE,exit-name
```

The requested installation exit has been disabled, and that function will not be processed until a LIBRARY RESET command for that exit is issued or the system is IPLed.

This message is issued when the LIBRARY DISABLE command is successfully processed. It is also issued during OAM address space initialization or restart when it is detected that an operator command previously issued a LIBRARY DISABLE command without an intervening LIBRARY RESET command.

Source: Object Access Method (OAM)

System Action: The OAM function controlled by the exit is disabled. This function will no longer be invoked. To enable the disabled function, issue a LIBRARY RESET command for the appropriate installation exit.

The installation exit will not be automatically reset by stopping and restarting the OAM address space, or during OAM address space restart due to an SCDS activation. Status of the installation exits can be obtained by using the DISPLAY SMS,OAM command.

CBR2000I Volume *volser* **marked unwriteable.**

Explanation: If LMSI media is involved then three consecutive attempts to write to volume *volser* have failed with a permanent error on the recording medium.

For non-LMSI media a single attempt to write to volume *volser* has failed with a permanent error on the recording medium.

Source: Object access method (OAM)

System Action: OAM attempts to retry the failing request on another volume. Any future request to write on the unwriteable volume fails; a request to read an object that was previously written on the volume is allowed. OAM will mark the volume not writable in the optical configuration database.

CBR2001I Volumes *volser-1* **and** *volser-2* **not found in library** *library-name***.**

Explanation: OAM has attempted to mount a library-resident optical volume in order to read or write a data object on the volume. The library slot where the volume resides, according to information in the optical configuration database, is empty or contains a different volume. This error is probably the result of improper manual movement of library volumes. In the message text, *volser-1* and *volser-2* are replaced by the volume serial numbers of the missing volume and its opposite side volume, and *library-name* is replaced by the name of the library in which the volumes should reside.

Source: Object access method (OAM)

System Action: OAM marks the volumes lost. If the current request is non-specific, an attempt is made to locate another suitable volume. If no other volume is found, or if the current request is for the specific volume, OAM fails the request. Any future specific request for either volume fails.

Operator Response: Notify the system programmer.

System Programmer Response: Determine where the volumes are actually located.

For 9246 libraries:

- If the lost volumes are in a shelf location, reenter the volumes into the library in which they are needed.
- If the lost volumes are in an offline library drive, vary the drive online. The volume and slot table entries in the optical configuration database may be incorrect. Follow the procedure for volumes in an incorrect slot.
- If the lost volumes are in an operator accessible drive, vary the drive offline, remove the volumes from the operator accessible drive and reenter the volumes into the library in which they are needed. The volume and slot table entries in the optical config-

uration database may be incorrect. Follow the procedure for volumes in an incorrect slot.

- If the lost volumes are in an incorrect slot, stop the OAM address space. Using interactive DB2 services, update the volume table and slot table entries in the optical configuration database to present the correct information. Start the OAM address space. If the volumes are in the wrong library, eject the volumes and reenter them into the library in which they are needed.

For 3995 libraries:

- If the lost volumes are in a shelf location, reenter the volumes into the library in which they are needed.
- If the lost volumes are in an offline library drive, vary the drive online. Perform a remap for that library. After completion of the remap, eject the volumes and reenter the volumes into the library in which they are needed.
- If the lost volumes are in an offline operator accessible drive, vary the drive online, remove the volumes from the drive and reenter the volumes into the library in which they are needed.
- If the volumes are in an incorrect slot, perform a remap for that library. After completion of the remap, eject the volumes and reenter the volumes into the library in which they are needed.

CBR2002I Cross-memory copy error between OAM address space and ASID *asid*.

Explanation: A user has requested the writing of a data object to a volume or the reading of a data object from a volume. An error occurred during the attempt to copy either data or control information cross-memory between user address space *asid* and the OAM address space.

Source: Object access method (OAM)

System Action: OAM cancels the user request. Request completion is not signaled to the user address space, since the likely result is another cross-memory failure.

Application Programmer Response: This is a probable user error. This error may follow the premature stopping of the user address space, or the premature stopping of the task in the user address space which requested OAM services, or the premature release of the storage containing the buffer from which the data object is to be written or into which the data object is to be read.

CBR2003I Tape volume *volser* not found.

Explanation: OAM has requested a mount for the tape volume *volser* in order to read or write a data object on the tape volume. The operator was unable to locate this tape volume to complete the pending mount request. In the message text, *volser* is replaced by the volume serial number of the missing tape volume.

Source: Object access method (OAM)

System Action: OAM marks the volume lost. If the current request is a grouped write request, an attempt is made to locate another suitable tape volume in that OBJECT or OBJECT BACKUP storage group. If no other tape volume in the group is available, then a scratch tape is sought. If there is no tape volume belonging to the group which can be used, and if there is no scratch tape which can be assigned to the OBJECT or OBJECT BACKUP storage group, or if the current request is for the specific volume, OAM fails the request. Any future specific request for the volume fails.

Operator Response: Notify the system programmer.

System Programmer Response: Determine where the volume is actually located. In order to clear the lost volume status, use the MODIFY OAM,UPDATE,VOLUME,*volser*,LOSTFLAG,OFF command to clear the lost flag, or stop then start the OAM address space.

CBR2004I Tape volume *volser* marked unwriteable.

Explanation: A permanent I/O error occurred when OAM was attempting to write to tape volume *volser*. OAM has marked the tape volume unwriteable in the TAPEVOL table in the optical configuration database.

Source: Object access method (OAM)

System Action: If the write request which encountered the I/O error could only be satisfied by writing the object(s) on the volume which was marked unwriteable, OAM fails the write request. If the request was a write for a storage group volume, then a different storage group volume will be used to satisfy this write request. Any future request to write on the unwriteable volume fails; a request to read an object that was previously written on the volume is allowed.

Operator Response: Notify the system programmer.

System Programmer Response: If you want OAM to continue to attempt to write data to this tape volume, then use the MODIFY OAM,UPDATE,VOLUME,*volser*,WRITABLE,Y command to set the volume's writable status to 'Y' in the OAM internal control block and in the DB2 row for that volume, or use SPUFI (SQL Processing Using File Input) under DB2I (DB2 Interactive) to set the WRITABLE column for this tape volume to 'Y'. Stop OAM, then start OAM to make OAM recognize the changed WRITABLE column for this tape volume. Once OAM recognizes that the tape volume is now writeable, it will attempt to write objects on this tape volume.

CBR2100I Volumes *volser-1* and *volser-2* entered into library *library-name*.

Explanation: The operator entered an optical disk into the input/output station of library *library-name* and OAM scheduled a request to enter the optical disk into the library. That request has now been successfully completed; the two volumes, *volser-1* and *volser-2*, which constitute the optical disk are in the library and available for use by OAM.

Source: Object access method (OAM)

System Action: The newly entered volumes will be used by OAM as they are needed.

CBR2101I Optical disk entry into library *library-name* failed.

Explanation: The operator entered an optical disk into the input/output station of library *library-name* and OAM scheduled a request to enter the optical disk into the library. That request has failed to complete successfully, as noted in a previous message to the operator.

Source: Object access method (OAM)

System Action: None.

Operator Response: Follow the instructions on the library error message which accompanied the failure.

CBR2102I LABEL function complete for volumes *volser-1* and *volser-2*.

Explanation: The operator entered a command of the form:

```
MODIFY OAM,LABEL
MODIFY OAM,LABEL,media-type
```

OAM scheduled a request to write volume labels on an unlabeled optical disk. That request has now been successfully implemented; the two volumes, *volser-1* and *volser-2*, which constitute the optical

disk are entered in the optical configuration database as scratch, storage group, or backup volumes and are available for use by OAM.

Source: Object access method (OAM)

System Action: The newly labeled volumes will be used by OAM as they are needed.

CBR2103I LABEL function on drive *drvename* failed.

Explanation: The operator entered a command of the form:

```
MODIFY OAM,LABEL
```

Object access method (OAM) scheduled a request to write volume labels on an unlabeled optical disk. That request failed to process successfully, as noted in a previous message to the operator.

Source: Object access method (OAM)

Operator Response: Follow the instructions on the drive error message which accompanied the failure.

CBR2104I Drive *drive-name* now online.

Explanation: The operator has entered a command of the form:

```
VARY SMS,DRIVE(drive-name),ONLINE
```

The specified drive *drive-name* has been varied online, as requested.

Source: Object access method (OAM)

System Action: The drive is now available for use by OAM.

CBR2105I Drive *drive-name* VARY ONLINE failed.

Explanation: The operator has entered a command of the form:

```
VARY SMS,DRIVE(drive-name),ONLINE
```

The attempt to VARY the specified drive *drive-name* online has failed, for the reason noted in a previous message to the operator. The most likely reason for the failure is the lack of an operational path to the drive.

Source: Object access method (OAM)

System Action: The drive is left in the offline state.

Operator Response: Notify the service representative.

CBR2106I Drive *drive-name* now offline.

Explanation: The operator has entered a command of the form:

```
VARY SMS,DRIVE(drive-name),OFFLINE
```

The specified drive *drive-name* has been varied offline, as requested.

Source: Object access method (OAM)

System Action: The drive is no longer available for use by OAM.

CBR2107I Drive *drive-name* VARY OFFLINE failed.

Explanation: The operator has entered a command of the form:

```
VARY SMS,DRIVE(drive-name)OFFLINE
```

The attempt to VARY the specified drive *drive-name* offline has failed, for the reason noted in a previous message to the operator. The most likely reason for the failure is the inability to demount the volume which is currently mounted on the drive.

Source: Object access method (OAM)

System Action: The drive is left in the pending offline state; this means that no new work will be scheduled to the drive. If there is a volume which cannot be demounted, that volume is unavailable until the situation is corrected.

Operator Response: Notify the service representative.

CBR2108I Undefined drive *library-drive-number* varied offline in library *library-name* for library/host synchronization.

Explanation: Physical drive *library-drive-number* is not defined in the SMS ACDS for library *library-name*, however is installed and available in the library. This was discovered during OAM initialization or as a result of a library vary online request.

Source: Object access method (OAM)

System Action: The drive is varied offline. OAM initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: If the drive is not to be part of this configuration, no action is necessary. If the drive definition is missing from the SMS CDS, add the definition using the ISMF Storage Administrator optical drive define panel and activate the newly modified SCDS.

CBR2109I Unable to do I/O to drive *drive-name*. Library data for owning library, *library-name*, unavailable during library initialization.

Explanation: Drive *drive-name* is defined online in the SMS ACDS or during OAM initialization, or a request to vary the drive online was entered for the drive. Library initialization processing for the drive's real library, *library-name*, OAM was not able to obtain the library data to build configuration information necessary for communications with the drives. Library initialization occurs during OAM initialization or when a library is brought online for the first time.

This can happen when:

- The CTC addresses for the library are offline during OAM initialization, so OAM is not able to communicate with the library, therefore unable to obtain library data.
- The library is connected after OAM initialization, and an attempt is made to vary a drive online before the library has been brought online.

Source: Object access method (OAM)

System Action: The drive is not brought online. If OAM is initializing, OAM initialization continues. If this was a vary request, the request fails.

Operator Response: Notify the system programmer.

System Programmer Response: If the drive is to be brought online to this OAM:

- Ensure the library and drives are not online to another OAM in an OAMPLEX
- Ensure the CTC addresses are connected to only this system
- Vary the CTC addresses online to MVS
- Vary the drive's controlling library online to OAM
- Vary the drive online to OAM.

CBR2150I Volume table update for volume *volser* failed during delete processing.

Explanation: The update to the VCB_RECOUNT field of the volume table row for volume *volser* failed during delete processing.

An attempt was made to perform a delete for a volume whose deleted objects count and deleted object space amount indicated that deletes were pending. The retrieval of a row in the deleted objects table for a row pertaining to this volume failed. As a result, the VCB_RECOUNT field needs to be updated to indicate to OAM that a recount is needed during the next OAM initialization. The

attempt to update the volume table row for this volume, specifically the VCB_RECOUNT field, failed.

Source: Object access method (OAM)

System Action: A different volume is sought for deletions.

Operator Response: View the console log to find the DB2 error message which fully described the volume table update error encountered.

CBR2151I Volumes *volser-1* and *volser-2* will be reinitialized on their next mount and have been returned to the OAM scratch pool.

Explanation: Reinitialization for the rewritable optical disk cartridge containing volumes *volser-1* and *volser-2* has been requested. Preliminary processing is complete. The actual reformatting will occur the next time either volume is mounted. These volumes have been returned to the OAM scratch pool.

Source: Object access method (OAM)

System Action: Once preliminary processing for this reinitialization request is complete, the volume empty (VOLEMPTY) indicators in the OAM volume table in the Optical Configuration Database for both *volser-1 volser-2*, are set to indicate that this cartridge is ready to be reinitialized. Every time a volume is mounted, the volume empty indicator is checked. If it indicated that the volume should be reinitialized, the reinitialization occurs as a part of the mount.

CBR2152I Retrieve from Deleted Objects Table for volume *volser* failed.

Explanation: A request was made to retrieve, from the Deleted Objects Table, a row which corresponds to volume *volser*, and that request failed. Due to the fact that two different tasks, possibly in two different address spaces, are inserting the row into the Deleted Objects Table and updating the Volume table row for the volume against which the delete was issued, it is possible for OAM to attempt to retrieve a row which has not yet been committed to the Deleted Objects Table. When this happens, OAM sets the recount indicator in the volume table row, and attempts the retrieval again at a later time.

Source: Object access method (OAM)

System Action: The retrieve request is reprocessed the next time a drive task is idle, and this volume is the optimal volume for deletes.

CBR2153I All objects on volumes *volser-1* and *volser-2* have expired, shelf location *shelf-loc*.

Explanation: All objects on a write-once optical disk cartridge have expired.

Source: Object access method (OAM)

System Action: If the volumes are library-resident, they are ejected. All knowledge of the volumes in OAM is removed.

Operator Response: Consult the hardware specification for this media type to understand and implement the procedure listed for the handling of expired media.

CBR2154I Volumes *volser-1* and *volser-2* will be reinitialized on their next mount and will remain assigned to storage group *stor_group*.

Explanation: Reinitialization for the rewritable optical disk cartridge containing volumes *volser-1* and *volser-2* has been requested. Preliminary processing is complete. The actual reformatting will occur the next time either volume is mounted. These volumes will remain assigned to storage group *stor_group*.

Source: Object access method (OAM)

System Action: Once preliminary processing for this reinitialization request is complete, the volume empty (VOLEMPTY) indicators in the OAM volume table in the Optical Configuration Database for both *volser-1 volser-2*, are set to indicate that this cartridge is ready to be reinitialized. Every time a volume is mounted, the volume empty indicator is checked. If it indicated that the volume should be reinitialized, the reinitialization occurs as a part of the mount.

CBR2155I Deleted space and deleted object count update for volume *volser* failed.

Explanation: The update of the deleted space and deleted object count associated with volume *volser* failed. As a part of delete scheduling, the volume's deleted space amount and deleted object count must be updated in the volume table. This message will be issued when either one of two error conditions occur. The first is, due to a DB2 error, perhaps a deadlock, timeout, or resource contention problem, this update was not done. In this case, this message will usually be preceded with error messages from DB2 indicating the nature of the DB2 error. The second error will occur when the volume serial number associated with the delete request could not be found in OAM's internal control blocks.

Source: Object access method (OAM)

System Action: When this message is issued, an entry for this object/volume pair has been added to the deleted objects table. The next time deletes are processed for this volume, the recount indicator will be set to indicate a recount of the deleted objects table entries for this volume is necessary. The next time OAM is initialized, the numbers will be reevaluated and reset from the contents of the deleted objects table if necessary.

CBR2156I Delete from Volume table for volumes *volser-1* and *volser-2* failed.

Explanation: Mark the volume as no longer available for use by OAM.

Source: Object access method (OAM)

System Action: Turn on the deleted bit in the volume control block to indicate that the volume is no longer available for use by OAM.

Application Programmer Response: The next time OAM is down, issue an SQL command, using SPUFI, to delete the rows for volumes *volser-1* and *volser-2* from the volume table of the optical configuration database. A sample SQL statement is:

```
DELETE FROM VOLUME
  WHERE VOLSER=volser-1 OR VOLSER=volser-2;
```

Note: Your installation may have prefixed table names such that there is a TSO/E userid associated with the name of the volume table.

CBR2157I Volume table row for *volser-1* not found during reinitialization.

Explanation: An attempt was made to retrieve the volume table row for volume *volser-1*, but the requested row was not found. As a part of reinitialization scheduling, a check is made to determine if the subject volume is known to OAM. In this case, no entry in the volume table was found for the subject volume.

Note: On the reinitialization request, only one volume serial number is specified, even though both volumes on an optical disk cartridge are reinitialized. That is why only one volume serial number is given in this message. The control block representing that volume could not be found, so its opposite side remains unknown.

Source: Object access method (OAM)

System Action: The reinitialization request is failed.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR2158I Eject failed for volumes *volser-1* and *volser-2*, Return Code=*return-code*.

Explanation: As part of reinitialization processing for a write-once cartridge, if the cartridge is library resident it must be ejected. During the eject of the library resident cartridge containing volumes *volser-1* and *volser-2*, a failure occurred and the volumes were not ejected.

The return code listed here is an internal OAM return code, and intended for diagnostic purposes only.

Source: Object access method (OAM)

System Action: The reinitialization request is failed.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR2159I Volume table update for volumes *volser-1* and *volser-2* failed during reinitialization.

Explanation: The update to the volume table for volumes *volser-1* and *volser-2* during reinitialization processing failed. As a part of reinitialization scheduling, the deleted space amount, storage group name, volume type, and deleted object count must be updated, for both volumes, in the volume table. Due to a DB2 error, perhaps a deadlock, timeout, or resource contention problem, the update could not be done.

Source: Object access method (OAM)

System Action: The reinitialization request is failed. It will be retried at a later time.

Operator Response: View the console log to find the DB2 error message which fully described the volume table update error encountered.

CBR2160I Reinitialization for volumes *volser-1* and *volser-2* failed, active objects found.

Explanation: Reinitialization was requested for volumes *volser-1* and *volser-2* but it failed because active objects were found on one or both of the volumes. As a part of reinitialization scheduling, the work scheduler checks to make sure that no new objects have been written on a volume between the time at which OSMC issued a reinit request, and OAM processed that request. If any active objects are found on the cartridge, the cartridge is currently in use for a write, or there are any outstanding specific write requests for the cartridge, the reinitialization request fails.

Source: Object access method (OAM)

System Action: The reinitialization request is failed, and retried when all objects on the subject volume have expired. Deferred delete processing for the deleted objects on these volumes is done just as if the reinitialization had never been requested.

Application Programmer Response: A defragmentation of each of these volumes is recommended.

CBR2161I Internal failure of deletes before write or defragmentation processing, volume *volser*.

Explanation: The deletes, required before write or defragmentation processing, for volume *volser* failed. As a part of write request processing, all objects pending delete must be deleted because the logically deleted space is included in the computed amount of usable space. Free space and logically deleted space are combined when finding a volume which can accommodate the first or only object to be written. In this case, some portion of the deletes being processed before the write request failed.

All pending deletes are performed before defragmentation requests because of the possibility of building much larger extents after deletion processing is complete.

Source: Object access method (OAM)

System Action: The write operation continues, in the hope that the volume has enough free space to accommodate the object, and the deleted space is not needed. If the write operation fails for a lack of space, an alternate volume is chosen.

The defragmentation operation continues, with the understanding that the pending deletes will be attempted again at a later time.

CBR2162I Update of the number of logical kilobytes of data deleted from tape volume *volser* failed.

Explanation: The update of the number of logical kilobytes of data deleted from tape volume *volser* failed. As a part of scheduling deletes for objects which reside on tape volumes, the tape volume's number of logical kilobytes deleted must be updated in the TAPEVOL table. This message is issued under two sets of circumstances:

- Due to a DB2 error, perhaps a deadlock, timeout, or resource contention problem, this update was not done. In this case, this message will be preceded with error messages from DB2 which indicate the nature of the DB2 error.
- The second type of error occurs when the tape volume serial number associated with the delete request could not be found in OAM's internal control blocks. This error occurs when either:
  - OAM's optical configuration data base does not have a row for the tape volume *volser* in the TAPEVOL table, or
  - the TAPEVOL table row was in error, and therefore was skipped during OAM initialization.

Source: Object access method (OAM)

System Action: When this message is issued, the number of logical KB deleted from the tape volume is no longer accurate. Since the number of logical KB deleted from a tape volume is only an approximation, OAM does not fail the delete request which corresponds to this logical kilobytes deleted update request, nor does it take any other recovery actions.

Operator Response: Notify the system programmer.

System Programmer Response: Investigate the previously issued DB2 error messages, and/or the previously issued OAM Initialization error messages. If there are no prior error messages related to this tape volume *volser*, then use SPUFI (SQL Processing Using File

Input) to SELECT the row for this tape volume from the TAPEVOL table. If there is no row for this tape volume in the TAPEVOL table, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR2163I TAPEVOL table row for tape volume *volser* **not found.**

Explanation: An attempt was made to update the TAPEVOL table row for tape volume *volser*, but the required row was not found. As a part of scheduling the update for the number of logical KB deleted from a tape volume, a check is made to determine if the subject volume is known to OAM.

In this case, there was an OAM control block for this tape volume *volser*, but there was no corresponding row in the TAPEVOL table. Based on its control block contents, OAM attempted to update the corresponding row in the TAPEVOL table, and received an error from DB2 because there is no corresponding row in the TAPEVOL table.

Source: Object access method (OAM)

System Action: The request to update the number of logical KB deleted from this tape volume is failed, but the corresponding delete request is not failed. Since the number of logical KB deleted from a tape volume is an approximation, no additional recovery processing is required.

OAM marks the tape volume control block as having been deleted so that no further requests which require this tape volume *volser* will be processed by OAM.

Operator Response: Notify the system programmer.

System Programmer Response: In order for there to be a control block in storage for a tape volume, there must have been an entry in the TAPEVOL table for the tape volume *volser* when OAM initialized. Determine the reason for the disappearance of the TAPEVOL table row, and insert the correct row back into the TAPEVOL table. Stop OAM then start OAM so that OAM will recognize and use this tape volume again. If the problem is not a user error, or you cannot reinsert the proper row into the TAPEVOL table, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR2200I Scratch volumes *volser-1* **and** *volser-2* **added to storage group** *storage-group-name***.**

Explanation: OAM has assigned the two scratch volumes, *volser-1* and *volser-2*, which together constitute an optical disk to a storage group *storage-group-name*. Either there is no free space left on the volumes which are currently in the storage group, or there are not enough volumes with free space to occupy all the optical drives which have been started for the storage group.

Source: Object access method (OAM)

System Action: The newly added volumes will be used by OAM for the writing of data objects directed to the storage group.

CBR2201I Scratch tape volume *volser* **added to storage group** *storage-group-name***.**

Explanation: OAM has assigned the scratch tape volume, *volser* to storage group *storage-group-name*. Either there was no free space left on the tape volumes which are currently in the storage group, or there were not enough usable tape volumes to occupy all the drives which have been started for the storage group.

Source: Object access method (OAM)

System Action: The newly added tape volume will be used by OAM for the writing of data objects directed to the storage group.

Operator Response: None.

CBR2210I No empty slots in library *library-name***. Disk to be ejected.**

Explanation: OAM has determined that scratch volumes are needed in library *library-name*, but there are no empty storage slots in the library. A request has been sent to the OAM storage management component to select an appropriate optical disk and eject it from the library. If OAM storage management component is not active, the operator must eject a volume using an ISMF, OAM, or SMS command.

Source: Object access method (OAM)

System Action: OAM schedules the ejection processing, then issues message CBR2211E or CBR2217E, requesting the operator to insert an unlabeled optical disk into the library input/output station.

Operator Response: Wait for the optical disk to be ejected from the library before following the instructions in message CBR2211E or CBR2217E.

CBR2211E Enter an optical disk into library *library-name* **to relieve the out of space condition in storage group** *storage-group-name***.**

Explanation: A request has been made to write an object on a volume which resides in a library. All volumes residing in the library and belonging to the requested storage group *storage-group-name* are full or are currently in use, and there are no scratch volumes in the library.

Source: Object access method (OAM)

System Action: If space is available on a volume in another library, and if the request is eligible to use that library, the write operation is completed normally. If space is available on a volume which is currently in use, and drive startup is not yet allowed, the write request waits until the volume becomes available.

Operator Response: Insert one of the following into the library input/output station of library *library-name*:

- An optical disk which already belongs to storage group *storage-group-name*, and has sufficient usable space to accommodate the object to be written.
- An optical disk which belongs to the scratch storage group and can be assigned to the storage group *storage-group-name* which is out of space.
- An unlabeled optical disk which can be labeled and assigned to the storage group *storage-group-name* which is out of space.

If you enter an unlabeled optical disk, be prepared to supply volume label information for the two volumes on the disk. Message CBR2211E is an action message which is removed from the console when the first usable optical disk has been successfully entered into the library. It may be wise at this time to insert several unlabeled disks or several scratch volumes into the library to create scratch space which will be usable for future requests; consult your system programmer.

CBR2212E Use the OAM LABEL command to label optical disks for shelf use to relieve the out of space condition in storage group *storage-group-name***.**

Explanation: A request has been made to write a data object on a volume which resides on the shelf. All volumes residing on the shelf and belonging to the requested storage group *storage-group-name* are full or are currently in use, and there are no scratch volumes on the shelf. This message requests the operator to prepare scratch volumes for shelf use.

Source: Object access method (OAM)

System Action: If space is available on a volume which is currently in use, the write request waits until the volume becomes available. If no space is available, the request fails.

Operator Response: Use the OAM LABEL operator command to request the labeling of an optical disk. Be prepared to supply volume label information for the two volumes on the disk. Message CBR2212E is an action message which is removed from the console when the first disk has been successfully labeled for shelf use. It may be wise to label several disks; consult your system programmer.

CBR2213I No space left in storage group *storage-group-name***.**

Explanation: OAM has been requested to write a data object to a volume in storage group *storage-group-name*. All the volumes assigned to the storage group are full. If the storage group is library-resident, there are no scratch volumes available in the library or libraries. If the storage group is shelf-resident, there are no scratch volumes available on the shelf.

Source: Object access method (OAM)

System Action: The write request is failed. If the storage group is library-resident, either message CBR2211E or CBR2217E has already been issued for each library. If the storage group is shelf-resident, message CBR2212E has already been issued. Either message requests the creation of scratch volumes by writing volume labels on an unlabeled optical disk.

Operator Response: Follow the procedure described in message CBR2211E, CBR2212E, or CBR2217E.

CBR2214I No space left on any tape volume in storage group *storage-group-name***.**

Explanation: OAM has been requested to write a data object to a tape volume in storage group *storage-group-name*. All of the usable tape volumes in this OBJECT or OBJECT BACKUP storage group have been marked full. There may be some tape volumes in this storage group which are not marked full, but are marked in some other way (for example the WRITABLE column in the TAPEVOL table row for the tape is set to 'N') which prevents them from being used for a write request.

Source: Object access method (OAM)

System Action: OAM will request a scratch mount from MVS Allocation to obtain a tape volume which can be assigned to the OBJECT or OBJECT BACKUP storage group which needs space.

Operator Response: Respond to the mount scratch request from MVS Allocation with a usable tape volume which OAM will then use to satisfy the outstanding write request.

System Programmer Response: None.

CBR2217E Enter an optical disk cartridge that is compatible with DEFAULT MEDIA TYPE *library-default-media-type* **and is write compatible with optical drive device type** *drive-device-type* **into library** *library-name* **to relieve the out of space condition in storage group** *storage-group-name***.**

Explanation: A request has been made to write an object to an optical disk volume belonging to storage group *storage-group-name*.

However, all optical disk volumes that reside in library *library-name* and belong to the requested storage group are:

- full, or
- currently in use, or
- not compatible with the DEFAULT MEDIA TYPE *library-default-media-type* currently associated with this library, or
- not write compatible with the optical drive device type *drive-device-type* installed in this library

Because there are no scratch optical disk volumes in the library that meet the criteria shown in the message, OAM cannot assign a scratch volume to the requested storage group.

Source: Object access method (OAM)

System Action: If optical disk space is available on an optical disk volume in another library, and if the request is eligible to use that library, the write operation completes normally. If optical disk space is available on a volume that is currently in use, and the drive startup threshold has not been exceeded, the write request waits until the volume becomes available. Otherwise, the request waits.

Operator Response: The type of optical disk media that you can enter into this library must be:

- Compatible with the DEFAULT MEDIA TYPE, *library-default-media-type*, for this library. If you need information about the optical disk media types that are compatible with each DEFAULT MEDIA TYPE, see the description of message CBR4448I.
- Compatible with the optical drive device type *drive-device-type* installed in this library. If you need information about the optical media types that can be written to by the *drive-device-type* installed in this library, see *DFSMS/MVS OAM Planning, Installation, and Storage Administration Guide for Object Support*.

Insert one of the following into the library input/output station of library *library-name*:

- An optical disk, of a media type that:
  - Is compatible with this library's DEFAULT MEDIA TYPE of *library-default-media-type*
  - Is write compatible with the *drive-device-type*
  - Already belongs to storage group *storage-group-name*
  - Has sufficient usable space to accommodate the object to be written.
- An optical disk, of a media type that:
  - is compatible with this library's DEFAULT MEDIA TYPE of *library-default-media-type*,
  - Is write compatible with the *drive-device-type*
  - Belongs to the scratch storage group
  - Can be assigned to the storage group *storage-group-name* that is out of space.
- An unlabeled optical disk, of a media type that:
  - Is compatible with this library's DEFAULT MEDIA TYPE of *library-default-media-type*
  - Is write compatible with the *drive-device-type*
  - Can be labeled and assigned to the storage group *storage-group-name*, which is out of space

    If you enter an unlabeled optical disk, be prepared to supply volume label information for the two volumes on the disk.

Message CBR2217E is an action message that is removed from the console when you successfully enter the first usable optical disk into the library. At this time, it might be wise to insert several unlabeled disks or several scratch volumes into the library to create space for future requests; consult your system programmer.

CBR2500I No drive usable for optical disk entry into library *library-name*.

Explanation: The operator has entered an optical disk into the input/output station of library *library-name*. In order to enter the optical disk into the library, one of the optical drives attached to the library must be used to perform volume label verification. All these drives are either offline or not operational.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station. Use the OAM DISPLAY DISPLAY SMS,DRIVE command to display drive status. If there is a library-attached drive which is currently offline, use the VARY SMS, DRIVE command to VARY it online, then reenter the optical disk into the library input/output station. If all library-attached drives are not operational, contact a service representative.

CBR2501I Optical disk entry into library *library-name* rejected. OAM termination in progress.

Explanation: The operator has entered an optical disk into the input/output station of library *library-name*. However, the OAM address space is in the process of shutting down, and no new work is being scheduled.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station. When the OAM address space has been restarted, try the optical disk entry again.

CBR2502I Optical disk entry into library *libname* rejected. Library not operational.

Explanation: The operator has entered an optical disk into the input/output station of a library. The library is not operational; therefore, the volume entry could not be scheduled.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station. Vary the library online, so that the operational status is changed to operational, using the following operator command:

```
VARY SMS,LIBRARY(library-name),ONLINE
```

When the library is operational, try the optical disk entry again.

CBR2503I Optical disk entry into library *libname* rejected. Library offline.

Explanation: The operator has entered an optical disk into the input/output station of a library. The library is offline; therefore, the volume entry could not be scheduled.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station. Vary the library online, using the following operator command:

```
VARY SMS,LIBRARY(library-name),ONLINE
```

When the library is online, try the optical disk entry again.

CBR2504I Optical disk entry into library *libname* rejected. Library pending offline.

Explanation: The operator has entered an optical disk into the input/output station of a library. The library is pending offline; therefore, the volume entry could not be scheduled.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station. Vary the library online, using the following operator command:

```
VARY SMS,LIBRARY(library-name),ONLINE
```

When the library is online, try the optical disk entry again.

CBR2505I Optical disk entry into library *libname* rejected. Library remap pending or in progress.

Explanation: The operator has entered an optical disk into the input/output station of a library. The library is currently being remapped, or a remap is pending for the library; therefore, the volume entry could not be scheduled.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station. When the library has been remapped, try the optical disk entry again.

CBR2506I Optical disk entry into library *libname* rejected. Zero control block address.

Explanation: The operator has entered an optical disk into the input/output station of a library. OAM could not determine if the I/O station was operational because its control block address was zero. As a result, the volume entry could not be scheduled.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR2507I Optical disk entry into library *libname* rejected. I/O station not operational.

Explanation: The operator has entered an optical disk into the input/output station of a library. The volume entry could not be scheduled because the I/O station was not operational.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station. Vary the library online, so that the operational status of the library I/O station is changed to operational, using the following operator command:

```
VARY SMS,LIBRARY(library-name),ONLINE
```

When the library I/O station is operational as the result of the successful vary on request, try the optical disk entry again.

CBR2508I Optical disk entry into library *libname* rejected. Queueing routine abended.

Explanation: The operator has entered an optical disk into the input/output station of a library. The volume entry could not be scheduled because the queueing routine abnormally stopped.

Source: Object access method (OAM)

System Action: The optical disk is not entered into the library.

Operator Response: Remove the optical disk from the library input/output station.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR2510I Volume Entry Scheduler failure for library *library-name*.

Explanation: The operator has entered an optical disk into the input/output station of library *library-name*. In order to enter the optical disk into the library, the Volume Entry Scheduler has been called to schedule the use of one of the library-attached optical drives to perform volume label verification. An abnormal end has occurred during Volume Entry Scheduler processing.

Source: Object access method (OAM)

System Action: The optical disk may not be entered into the library, depending on when the error occurred. OAM attempts to continue processing in degraded mode.

Operator Response: Do not attempt to repeat the optical disk entry sequence until OAM has been stopped and restarted. Schedule an OAM restart at the earliest convenient time.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Format the SVC dump with the Interactive Problem Control System (IPCS).

CBR2550I Optical disk entry into library *library-name* scheduled.

Explanation: The operator has entered an optical disk into the input/output station of library *library-name*. OAM has scheduled a request to enter the optical disk into the library.

Source: Object access method (OAM)

System Action: When an optical drive which is attached to the library is available, the optical disk will be mounted, and volume label verification will be performed.

CBR2600A Specify shelf location for volumes *volser-1* and *volser-2*.

Explanation: A request has been made to eject an optical disk from a library. The request may have been made by ISMF, OSMC, or an operator command:

```
MODIFY OAM,EJECT,volser,LOCATION
LIBRARY EJECT,volser,LOCATION
```

The operator is asked to provide the shelf location where the optical disk is to be stored, so that the information may be recorded in the optical configuration database. The response may be up to 32 characters in length and may contain any information that the installation considers pertinent; the response is stored as supplied with no format or content check. In the message text, *volser-1* and *volser-2* are replaced by the volume serial numbers of the two volumes which are recorded on the optical disk.

Source: Object access method (OAM)

System Action: The OAM component, either OSMC or operator command processing, waits for a response from the operator. When the response is received, it is stored in the two volume records in the optical configuration database.

Operator Response: Supply the requested information.

CBR2601A Specify shelf location for volume *volser*.

Explanation: A request has been made to eject a volume from a library. The operator is asked to provide the shelf location which indicates where the volume *volser* is to be stored, so that the information may be recorded in the tape configuration database. The response may be up to 32 characters in length and may contain any information that the installation considers important; the response is stored as supplied with no format or content check.

Source: Object Access Method (OAM)

System Action: The OAM volume eject scheduler waits for a response from the operator. Scheduling of other OAM requests may be suspended until the operator responds to this message. Upon successful completion of the eject request, the response is stored in the tape configuration database record.

Operator Response: Supply the requested information.

CBR2602A Eject pending for *volser* in *r-library*. Default pseudo library is *p-library*. Reply 'U' to use, 'R' to respecify.

Explanation: A request has been made to eject a volume from a library. The volume, *volser*, needs to be assigned to a pseudo library on eject completion, and the current pseudo library for this volume is invalid or the volume does not have a current pseudo library. The library, *r-library*, where the volume currently resides has a default pseudo library, *p-library*, in the configuration. This default pseudo library name can be used by replying 'U' to this message, or it can be indicated that a different pseudo library is to be provided by replying 'R' to this message.

Source: Object Access Method (OAM)

System Action: The OAM volume eject process waits for a response from the operator. If the response to this message is 'U', the volume being ejected is assigned to the default pseudo library. If the response to this message is 'R', message CBR2603A is issued requesting a pseudo library destination for the volume.

Operator Response: Reply 'U' if the volume that is pending eject can be assigned to the default pseudo library.

Reply 'R' if the volume that is pending eject is to be assigned to a different pseudo library than the default. Then, reply to message CBR2603A with the appropriate pseudo library for the volume.

CBR2603A Specify pseudo library name for volume *volser*.

Explanation: A request has been made to eject a volume from a library. The volume, *volser*, needs to be assigned to a pseudo library on eject completion. Either the library where the volume currently resides does not have a default pseudo library in its SCDS definition, or 'R' was replied to message CBR2602A, indicating that the default pseudo library name was not to be used when this volume is ejected.

Source: Object Access Method (OAM)

System Action: The OAM volume eject process waits for a response from the operator. If the response to this message is a valid pseudo library in the active SMS configuration, the volume is assigned to this pseudo library and the volume record updated. If the response to this message is not a valid pseudo library in the active

SMS configuration, CBR2604I is issued and this message is reissued, requesting valid pseudo library name.

Operator Response: Supply the requested information.

CBR2604I Volume *volser* cannot be assigned to pseudo library *p-library-name*, it is not a valid pseudo library definition in the active SMS configuration.

Explanation: A request has been made to eject a volume from a library. Either:

- The volume, *volser*, had an invalid pseudo library name, *p-library-name*, in its volume record or,
- Message CBR2603A was issued requesting a pseudo library name for volume *volser* and the pseudo library name, *p-library-name*, specified in reply to CBR2603A is not a valid pseudo library definition in the active SMS configuration.

Source: Object Access Method (OAM)

System Action: Either CBR2602A or CBR2603A is issued and the OAM eject process waits for a response from the operator.

Operator Response: Supply a valid pseudo library name when CBR2603A is issued.

CBR2610I Volume Eject Scheduler failure for volume *volser*.

Explanation: A request has been made either by the operator or by the OAM storage management component to eject an optical disk from a library. The volume eject scheduler has been called to schedule the request for implementation. An abnormal stop has occurred during volume eject scheduler processing. In the message text, *volser* is replaced by the volume serial number of one of the two volumes which constitute the optical disk.

Source: Object access method (OAM)

System Action: The optical disk may not be ejected from the library, depending on when the error occurred. OAM attempts to continue processing in degraded mode.

Operator Response: Do not attempt to repeat the optical disk eject sequence until OAM has been stopped and restarted. Schedule an OAM restart at the earliest convenient time.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Format the SVC dump with the interactive problem control system (IPCS).

CBR2612I Eject request rejected for volume *volser*. TCDB access error occurred.

Explanation: When attempting to retrieve the tape volume record from the tape configuration database for volume *volser*, an error was detected.

Source: Object Access Method (OAM)

System Action: OAM continues processing. Eject request is not scheduled.

Operator Response: See preceding IDC3009I message for an explanation of the tape configuration database failure. Resubmit the eject request for the volume.

CBR2613I Eject request rejected for volume *volser*. Library *library-name* not defined.

Explanation: Eject request for volume *volser* is rejected because the library *library-name* specified in the tape volume record is not in the active SMS configuration.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

CBR2614I Eject request rejected. Volume *volser* is already scheduled to be ejected.

Explanation: Eject request for volume *volser* has been rejected because the volume has already been scheduled to be ejected by a prior eject request.

Source: Object Access Method (OAM)

System Action: OAM processing continues with the original volume eject request.

CBR2615I Eject request rejected. Attempt to add request for volume *volser* to internal queue failed.

Explanation: An attempt to add an eject request for volume *volser* to the internal work queue has failed.

Source: Object Access Method (OAM)

System Action: None.

Operator Response: If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR2616I Eject request rejected for volume *volser*. Unable to obtain storage for volume record.

Explanation: When attempting to schedule the eject for volume *volser*, a failure occurred when obtaining storage for the volume record.

Source: Object Access Method (OAM)

System Action: For a STORAGE OBTAIN failure, message CBR7004I has already been issued.

Operator Response: For a STORAGE OBTAIN failure, see message CBR7004I.

CBR2617I Eject request rejected for volume *volser*. Installation exit (CBRUXEJC) disabled.

Explanation: The cartridge eject installation exit (CBRUXEJC) has been disabled because of a previously detected error; therefore, the request to eject volume *volser* is rejected.

Source: Object Access Method (OAM)

System Action: The volume remains in the library.

CBR2700I Volume *volser* in library *library-name* audit complete.

Explanation: A single volume audit for volume *volser* in library *library-name* has been completed. This message is issued to the TSO user ID of the storage administrator that initiated the audit request.

Source: Object Access Method (OAM)

System Action: For valid audit errors, or no error, the volume error status field is updated.

System Programmer Response: To view results of this audit, use the REFRESH command on the ISMF mountable optical volume list or mountable tape volume list panel and consult the volume error

status field for the volume. If a valid audit error is found, the volume error status field indicates the nature of the error, or no error.

CBR2701I Volume list audit complete.

Explanation: A list of volumes has been audited. During the audit, a message was issued for each error found. This message was issued to the TSO user ID of the storage administrator that initiated the audit request.

Source: Object Access Method (OAM)

System Action: For valid audit errors, or no error, the volume error status field is updated.

System Programmer Response: To view results of this audit, use the REFRESH command on the ISMF mountable optical volume list panel or the mountable tape volume list panel and consult the volume error status field for each volume. If a valid error is found for a volume in the list, the volume error status field indicates the nature of the error, or no error.

CBR2702I Library *library-name* audit complete.

Explanation: Library *library-name* was audited. During the audit, a message was issued for any errors found. The messages were issued to the TSO user ID of the storage administrator that initiated the audit request.

Source: Object Access Method (OAM)

System Action: For valid audit errors, or no error, the volume error status field is updated.

System Programmer Response: To view results of this audit, consult the error status field displayed on the ISMF mountable optical volume list panel or the mountable tape volume list panel, or use the LISTVOL line operator for the library to display a list of the volumes. If a valid error is found for a volume in the library, the volume error status field indicates the nature of the error.

CBR2703I Audit request rejected. Audit for volume *volser* has already been scheduled.

Explanation: Volume *volser* has an audit pending; duplicate audits are not scheduled. This message is issued to the TSO user ID of the storage administrator that initiated the audit request, the completion message will be sent to the TSO user ID of the storage administrator that initiated the original audit request.

Source: Object Access Method (OAM)

System Action: OAM processing continues for the original audit request for this volume.

System Programmer Response: Check the volume error status field for this volume in the ISMF mountable optical volume list panel or the mountable tape volume list panel at a later time for the results of the audit. If a valid error is found, the volume error status field indicates the nature of the error. The completion indication message is sent to the storage administrator who initiated the audit.

CBR2704I Audit request rejected for volume *volser*. Library *library-name* is not online and operational.

Explanation: Volume *volser* audit request has been rejected. Library *library-name* is offline, pending offline, or not operational. This message is issued to the TSO user ID of the storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: This audit request fails. OAM processing continues.

System Programmer Response: Contact your operator to vary the library online. If this procedure fails due to a hardware error, contact your service representative to repair the failing component. Resubmit the audit request when the library is online and operational. Refer to any previous messages issued to the operator's console describing any detected hardware error.

CBR2705I Audit request rejected. Volume *volser* is not library resident.

Explanation: Audit request for volume *volser* has been rejected because the volume is shelf-resident. This message is issued to the TSO user ID of the storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

System Programmer Response: Audit shelf volumes manually.

CBR2706I Audit request rejected. Volume information was not found for volume *volser*.

Explanation: Audit request for volume *volser* has been rejected because volume information could not be found by OAM to build an audit request. For an optical volume, no record could be found in the OCDB for this volume. For a tape volume, no record could be found in the TCDB for this volume. This message is issued to the TSO user ID of the storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

System Programmer Response: For optical volumes, if the volume row is added to the optical configuration data base after OAM initialization, OAM does not recognize it unless OAM is terminated and started again.

CBR2707I Audit request rejected. Volume serial number *volser* is not valid.

Explanation: An attempt has been made to build an audit request; however, the volume serial number *volser* does not meet MVS volume serial number naming conventions for an optical volume, or tape library volser naming conventions for a tape volume. This message is issued to the TSO user ID of the storage administrator that initiated the audit request.

Source: Object Access Method (OAM)

System Action: OAM processing continues

System Programmer Response: Verify the volume serial number using the ISMF mountable tape volume list or the ISMF mountable optical volume list.

CBR2708I Audit request rejected. Volume *volser* is scheduled to be ejected.

Explanation: Audit request for volume *volser* has been rejected or canceled because the volume has been scheduled to be ejected from the library. This message is issued to the TSO user ID of the storage administrator that initiated the audit request.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

System Programmer Response: This volume will be shelf-resident after the eject. Audit shelf volumes manually.

CBR2709I Audit request rejected. An attempt to obtain storage failed.

Explanation: An attempt to acquire storage required for processing an audit request failed. The audit is rejected. For a full library audit, some volumes may have audits already scheduled; however, additional audit requests will not be scheduled. This message is issued to the TSO/E userid of the storage administrator that initiated the audit request.

Source: Object access method (OAM)

System Action: No new audits will be scheduled.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR2710I Audit terminated while auditing volume *volser*. An error in library *library-name* detected.

Explanation: Volume *volser* was not audited. During the audit, a hardware error was detected in library *library-name* stopping the audit. No other audits will be scheduled or processed for this request until the failing library component has been repaired. This message is issued to the TSO/E userid of the storage administrator that initiated the audit request.

Source: Object access method (OAM)

System Action: Any volume audits for this request that have not been processed will be cancelled. No new audits for this library will be scheduled.

System Programmer Response: Contact your operator to vary the library online. If this fails, contact your service representative to repair the failing library component. Resubmit the audit request when the library is online and operational.

CBR2711I Audit request rejected for volume *volser*. Remap for library *library-name* requested.

Explanation: Volume *volser* audit request was rejected. A request to remap library *library-name* is in progress or pending. This message is issued to the TSO/E userid of the ISMF storage administrator who initiated the audit request.

Source: Object access method (OAM)

System Action: This audit request fails. OAM processing continues.

System Programmer Response: Consult the mountable optical volume list after the remap has completed.

CBR2712I Audit request rejected for volume *volser*. TCDB access error occurred.

Explanation: An error was detected when attempting to retrieve the tape volume record from the TCDB for volume *volser*. This message is issued to the TSO user ID of the storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: No further volume audits are scheduled for this audit request.

System Programmer Response: See message IDC3009I issued to operator console regarding catalog error. Resubmit the audit request for the volumes not processed after catalog error is resolved.

CBR2714I Audit request rejected for volume *volser*. Library *library-name* has no available drives.

Explanation: All drives for library *library-name* are either offline, pending offline, or not operational. Volume *volser* could not be audited. This message is issued to the TSO/E userid of the storage administrator that initiated the audit request.

Source: Object access method (OAM)

System Action: If the audit request is a full library audit, any volume audits for this request that have not been processed will be cancelled. No new audit requests for this library will be scheduled.

System Programmer Response: Contact your operator to vary at least one drive online. If the drives are not operational, contact your service representative to repair the drives. Resubmit the audit request for the volumes not processed when there is at least one online and operational drive.

CBR2715I Audit request rejected for volume *volser*. Library *library-name* is in manual mode.

Explanation: During audit processing for volume *volser* in library *library-name*, the library has signaled that it is in manual mode. No other audits are processed for this library while the library is in manual mode. This message is issued to the TSO user ID of the storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: Any volume audits for this library that have not been processed are cancelled. The audit request fails. OAM processing continues.

System Programmer Response: Resubmit audit request when library is no longer in manual mode.

CBR2716I Audit request rejected for volume *volser*. Library *library-name* vision system inoperative.

Explanation: Volume *volser* has not been audited. Audits for library *library-name* are no longer performed because the library vision system is not functioning. This message is issued to the TSO user ID of the ISMF storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: Any volume audits for this library that have not been processed are cancelled. OAM processing continues.

System Programmer Response: Resubmit audit when vision system is again operational.

CBR2717I Audit request rejected. Attempt to add request for volume *volser* to internal queue failed.

Explanation: An attempt to add an audit request for volume *volser* to the internal work queue has failed. If the request is a library audit, some volumes may have audits already scheduled; however, at the time of this failure, additional audit requests are not scheduled. This message is issued to the TSO user ID of the storage administrator that initiated the audit request.

Source: Object Access Method (OAM)

System Action: No further audits are scheduled.

System Programmer Response: If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR2718I Audit request rejected. Volume *volser* has the wrong media type for audit processing.

Explanation: The volume information for volume *volser* indicates an incorrect media type for audit processing. Audit processing is performed only on volumes of cartridges stored in six models (3995-111, 3995-112, 3995-113, 3995-131, 3995-132, 3995-133) of optical disk libraries. This message is issued to the TSO/E userid of the storage administrator that initiated the audit request.

Source: Object access method (OAM)

System Action: OAM processing continues.

System Programmer Response: Verify that the ISMF mountable optical volume list from which the audit request was submitted is current.

CBR2732I Volume list audit requests for volumes in library *library-name* canceled. Library unavailable.

Explanation: A volume list audit request includes audit requests for volumes in a library that is no longer capable of handling the requests. The library may have been made unavailable for one of several possible reasons:

For an optical volume

- Library is offline
- Library is pending offline
- Library is not operational
- Library is in remap mode

For a tape volume in an Automated tape library dataserver

- Library is offline
- Library is pending offline
- Library is not operational
- Library is in manual mode
- Library's vision system is not operational

For a tape volume in a Manual Tape Library Dataserver

- Library is offline
- Library is pending offline
- Library is not operational

This message is issued to the TSO user ID of the storage administrator that initiated the audit request.

Source: Object Access Method (OAM)

System Action: The audit requests for these volumes have been canceled. Any volumes in the volume list for other libraries continue processing. No new audits for this library are scheduled until the library is capable of handling the request.

System Programmer Response:

- If the library is offline or pending offline, have the operator vary it online.
- If the library is not operational, or the tape library's vision system is not operational, contact your hardware service representative to repair the library.
- If there are no drives available in an optical library, vary at least one drive online.
- If the optical library has a remap pending or in progress, wait until the operation is complete.
- If the Automated tape library dataserver is in manual mode, have the operator put the library in automated mode.
- See any previous messages issued to the operator's console, describing any hardware error that may have occurred. Obtain the logrec error record.

CBR2737I The OAM address space is terminating. Pending audits for this request will be canceled.

Explanation: An operator command requesting termination of OAM has been issued, or an error has occurred, causing the OAM address space to be terminated. This message is issued to the TSO user ID of the storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: Any audits requested and scheduled, but not already started, are canceled. OAM proceeds with termination.

System Programmer Response: Resubmit any audit requests when OAM is available.

CBR2762I Audit request rejected. Volume *volser* media type is not compatible with library *library-name*.

Explanation: Volume *volser* information has media type that is not compatible with the device type for library *library-name*. The volume information indicates that volume *volser* resides in library *library-name*. This message is issued to the TSO/E userid of the storage administrator that initiated the audit request.

Source: Object access method (OAM)

System Action: OAM processing continues.

System Programmer Response: Refresh the ISMF screen from which the audit was requested. Verify that library information does not have an incorrect device type value or that the volume information does not have an incorrect media type value.

CBR2780I Remap failed. Unable to demount drive *drive-name* in library *libname*.

Explanation: Preparation for a library remap requires that all library resident drives be empty. A demount for a library resident drive was unsuccessful, so remap could not be performed.

Source: Object access method (OAM)

System Action: Remap not initiated.

Operator Response: Refer to any messages issued for drive demount failure. Contact your IBM service representative. Resubmit the remap request when the drive is successfully demounted.

CBR2781I Remap failed for library *libname*. OAM internal error.

Explanation: An OAM internal error occurred when attempting to schedule a remap to an optical library.

Source: Object access method (OAM)

System Action: Remap failed.

System Programmer Response: Contact IBM Service Representative.

CBR2785I Demount failure for volumes *volser-1* and *volser-2*, drive *drive-name*. Remap proceeding.

Explanation: A demount failed for volumes *volser-1* and *volser-2* on an operator accessible drive.

Source: Object access method (OAM)

System Action: Remap continues.

CBR2811I REFORMAT volume *old_volser* **rejected. New volume serial number** *new_volser* **is invalid.**

Explanation: The new volume serial number *new_volser* supplied does not conform to MVS volume serial number conventions.

Source: Object access method (OAM)

System Action: The command is rejected.

System Programmer Response: Reissue the command with a correct new volume serial number.

CBR2812I REFORMAT volume *old_volser* **rejected. New VOLSER** *new_volser* **already exists. Duplicate {optical|tape|DASD} volume.**

Explanation: OAMUTIL is submitted in the form of

```
OAMUTIL REFORMAT old_volser
                [ ONE|BOTH]
                [ NEWVOL1(new_volser1)]
                [ NEWVOL2(new_volser2)]
                [ DRIVENAME(drive_name)]
                [ SCRATCH|NOSCRATCH]
                [ FORCE|NOFORCE]
```

The new volume serial number *new_volser* supplied already exists in the DB2 Volume Table, the Tape Configuration Database (TCDB) or on a DASD volume.

Source: Object access method (OAM)

System Action: The command is rejected.

System Programmer Response: Reissue the command with a unique new volume serial number.

CBR2813I REFORMAT volume *old_volser* **rejected. { Invalid volume serial number|Volume not defined }.**

Explanation: OAMUTIL is submitted in the form of

```
OAMUTIL REFORMAT old_volser
                [ ONE|BOTH]
                [ NEWVOL1(new_volser1)]
                [ NEWVOL2(new_volser2)]
                [ DRIVENAME(drive_name)]
                [ SCRATCH|NOSCRATCH]
                [ FORCE|NOFORCE]
```

The request is rejected. The reason is one of the following:

Invalid old volume serial number The *old_volser* entered is not a valid MVS volume serial number.

Volume not defined The *old_volser* entered does not exist in the DB2 Volume Table.

Source: Object access method (OAM)

System Action: The command is rejected.

System Programmer Response: Reissue the command with a correct old volume serial number.

CBR2814I REFORMAT volume *old_volser* **rejected. Optical disk drive** *drive_name* **is {offline | pending offline | not operational| not defined | library resident|write protected| not compatible}.**

Explanation: OAMUTIL is submitted in the form of

```
OAMUTIL REFORMAT old_volser
                [ ONE|BOTH]
                [ NEWVOL1(new_volser1)]
                [ NEWVOL2(new_volser2)]
                [ DRIVENAME(drive_name)]
                [ SCRATCH|NOSCRATCH]
                [ FORCE|NOFORCE]
```

The Optical disk drive *drive_name* is either offline, pending offline, not operational, not defined in the SMS Active Control Data Set, not an operator accessible drive, or write protected.

Source: Object access method (OAM)

System Action: The command is rejected.

System Programmer Response: Use the DISPLAY SMS,DRIVE command to display drive status.

- If the drive is not defined or library resident, reissue the command with a correct drive name.
- If the drive is an operator accessible drive but is currently offline or pending offline, use the VARY SMS,DRIVE command to VARY it online, then reissue the command.
- If the drive is an operator accessible drive but is not operational, vary the drive offline then back online and reissue the command. If the problem reoccurs, contact a service representative.
- If the drive is write protected or not compatible, reissue the command with another operator accessible drive.

CBR2815I The specified drive *drive-name* **for REFORMAT is ignored. Volume** *old_volser* **is library resident.**

Explanation: OAMUTIL is submitted in the form of

```
OAMUTIL REFORMAT old_volser
                [ ONE|BOTH]
                [ NEWVOL1(new_volser1)]
                [ NEWVOL2(new_volser2)]
                [ DRIVENAME(drive_name)]
                [ SCRATCH|NOSCRATCH]
                [ FORCE|NOFORCE]
```

The requested volume *old_volser* is inside a 3995 optical library. The specified optical drive *drive_name* is ignored.

Source: Object access method (OAM)

System Action: OAM selects a library drive to process the request.

CBR2816I REFORMAT not allowed for volume *old_volser***. Error condition = { Write protected| Eject scheduled| Relabel scheduled| Reformat scheduled| Object Backup volume| Write scheduled| Active object found| DB2 volume table error| DB2 object directory table error| Reinit scheduled| LMSI media }.**

Explanation: OAMUTIL is submitted in the form of

```
OAMUTIL REFORMAT old_volser
                [ ONE|BOTH]
                [ NEWVOL1(new_volser1)]
                [ NEWVOL2(new_volser2)]
                [ DRIVENAME(drive_name)]
                [ SCRATCH|NOSCRATCH]
                [ FORCE|NOFORCE]
```

The command was rejected because one of the following:

Write protected: The volume is a write protected volume.

Eject scheduled: An eject request has already scheduled for this volume.

Relabel scheduled: The Relabel request has already scheduled for this volume.

Reformat scheduled: The Reformat job has already scheduled for this volume.

Object Backup volume: The volume is an Object Backup volume

Write scheduled: The volume is not expired, at least one write request has already been scheduled to it.

Active object found: Unexpired objects are found on this volume.

DB2 volume table error: A DB2 error is encountered when updating the DB2 Volume Table row for this volume.

DB2 object directory table error: A DB2 error is encountered when accessing the DB2 Object Directory Table for this volume.

Reinit scheduled: OSMC has scheduled a reinitialization request to this volume and the opposite side of this volume.

LMSI media: This is not a 3995 optical disk cartridge, it is a LMSI optical disk cartridge.

Source: Object access method (OAM)

System Action: The command is rejected.

System Programmer Response: Use the DISPLAY SMS,VOLUME command to display volume status.

CBR2819I Unable to {connect|disconnect} DB2 Object Directory database. RC = *return-code***. Reformat terminated.**

Explanation: An error occurred attempting to access DB2 Object Directory Database. The error code from DB2 is *return-code*.

Source: Object access method (OAM)

System Action: The command failed.

Operator Response: Notify database administrator.

CBR2822I RELABEL function completed for volume *old_volser* **to** *new_volser***.**

Explanation: The operator entered a command of the form:

```
MODIFY OAM,{RELABEL|RL},old_volser,new_volser
      [,drive_name]
```

to rename the volume serial number of the requested optical disk volume from *old_volser* to *new_volser*. That request has now been successfully completed.

Source: Object access method (OAM)

System Action: The newly labeled volume will be used by OAM as it is needed.

CBR2823I RELABEL function failed for volume *old_volser* **to** *new_volser***.**

Explanation: The operator entered a command of the form:

```
MODIFY OAM,{RELABEL|RL},old_volser,new_volser
      [,drive_name]
```

to rename the volume serial number of the optical disk volume from *old_volser* to *new_volser*. That request has failed as noted in a previous message to the operator.

Source: Object access method (OAM)

Operator Response: Follow the instructions on the previous error message which accompanied the failure.

CBR3000I Storage unavailable for LTCB control block. Library initialization terminated.

Explanation: The library control task attempted to get storage for the LTCB control block but the request failed. This message is preceded by message CBR7004I which contains the return code from the STORAGE macro.

Source: Object access method (OAM)

System Action: Library initialization is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the STORAGE error by investigating the return code from the STORAGE macro and referring to the documentation for message CBR7004I.

CBR3001A Remove cartridge from I/O station on library *library-name***. Place in shelf location** *shelfloc***.**

Explanation: An optical disk cartridge was placed in the I/O station either as a result of:

1. an eject request completion for library *library-name*,
2. an operator inserted the cartridge for entry.
3. a cartridge was found in the I/O station at library initialization time (OAM initialization or library vary online).
4. a cartridge was found in the I/O station during a library REMAP processing.

If the shelf location is unknown at this time, '??????' is substituted in the message.

If the cartridge was ejected as a part of reinitialization of expired write-once media, and there was no shelf location already known for the cartridge at the time of ejection, the reserved shelf location of '??????' is supplied by the system.

Source: Object access method (OAM)

System Action: Processing continues.

Operator Response: Remove the optical disk cartridge from the library's I/O station and return it to the specified shelf location. If a library REMAP is not in progress, the cartridge can be re-entered into the library.

Note: It is extremely important to remove the cartridge as soon as possible when this message is issued. Not doing so could have the effect of stopping all picker associated activity in the library. This condition is more likely to occur when a series of cartridge ejects have been issued against a library.

CBR3002E Library *library-name* **no longer usable.**

Explanation: A major component of library *library-name* cannot be used until either the library is varied online, or the failing library component is serviced.

Source: Object Access Method (OAM)

System Action: The library is marked not operational. Pending library requests are purged.

Operator Response: See a previous error message for details. Contact hardware support.

CBR3003I Library *library-name* now offline.

Explanation: The operator varied the library *library-name* offline, or the library was set offline during OAM initialization. All queued requests have been serviced and the library is now offline.

Source: Object access method (OAM)

System Action: The library is marked offline. No further requests will be honored until the library is online.

CBR3004I Library *library-name* now online.

Explanation: The operator issued a request to VARY library *library-name* online. All initialization procedures have completed successfully.

Source: Object access method (OAM)

System Action: The library is marked online and the drive tasks are posted to ask for work.

CBR3005A Remove entered cartridge from I/O station on library *library-name*. Another cartridge waiting to be ejected.

Explanation: The cartridge placed in the I/O station by the operator for cartridge entry must be removed so that cartridge ejection can proceed.

Source: Object access method (OAM)

System Action: Cartridge ejection processing waits until the entered cartridge has been removed.

Operator Response: Remove the cartridge from the I/O station and wait until the cartridge has been ejected before entering another one.

CBR3006I Library *library-name* with Library ID *library-ID* unknown in I/O configuration.

Explanation: Library *library-name* with library ID *library-ID* is defined in the active SMS configuration, and either

- there is no tape device in the current I/O configuration that is associated with a tape library having the ISMF specified Library-ID, or
- the library was defined to HCD using the optional LIBRARY-ID and LIBPORT-ID parameters, however the library (and drives) was unavailable during the IPL (or IODF activate).

Source: Object Access Method (OAM)

System Action: The tape library is marked not operational. The tape volumes that belong to the tape library are not accessible.

System Programmer Response: The system programmer and/or system operator should verify each of the following items:

1. Verify that each of the tape subsystem control units within the tape library is powered on and correctly IML'ed.
2. Verify that the channel interfaces from each tape subsystem control unit to the channel subsystem of the processor complex on which this message (CBR3006I) was received are enabled.
3. Verify that the channel paths to each tape device within the tape library are online using the MVS DEVSERV PATHS command.
4. Verify that the tape devices within the tape library are online using both the MVS DISPLAY UNITS command and the MVS LIBRARY DISPDRV command.
5. Verify that the library-ID that appears in the text of this message matches the library sequence number that is displayed on the 3494/3495 Library Manager Operational Status pop-up window. The library sequence number is set by the IBM customer engineer when the tape library is installed or when a teach operation is performed at the Library Manager service console.

   If the Library-ID in this message does not match the library sequence number displayed on the 3494/3495 Library Manager Operational Status pop-up window, then correct whichever one is wrong (the two must be the same).

   If the Library-ID in message CBR3006I is wrong, alter the Library-ID using the ISMF ALTER line operator on the ISMF Tape Library List panels and re-activate the SMS configuration using the SETSMS command or the ISMF Control Data Set Application. After re-activating the SMS configuration, verify the tape library is online by issuing the following command:

   ```
   DISPLAY SMS,LIBRARY(library-name),DETAIL
   ```

   If the tape library is not online, vary the tape library online by issuing the following command:

   ```
   VARY SMS,LIBRARY(library-name),ONLINE
   ```

   If the library sequence number displayed on the 3494/3495 Library Manager Operational Status pop-up window is wrong, have your IBM customer engineer correct the library sequence number using the 3494/3494 Library Manager Service panel, "Teach" action bar item, "Teach Current Configuration" pull-down menu item. After correcting the library sequence number at the 3494/3495 Library Manager service console, re-IPL the MVS/ESA operating system.

   If the library-ID that appears in the text of this message matches the library sequence number that is displayed on the 3494/3495 Library Manager Operational Status pop-up window, and the library was defined to HCD using the optional LIBRARY-ID and LIBPORT-ID parameters, when the tape library and library devices are available to the system, vary at least one of the library devices online using the MVS VARY command and then vary the tape library online by issuing the following command:

   ```
   VARY SMS,LIBRARY(library-name),ONLINE
   ```

Operator Response: Perform all the steps listed under system programmer response.

CBR3007I Power on sequence completed in library *library-name*. Check the status of the library and drives.

Explanation: Library *library-name* has been powered on while OAM was started. Perform the actions defined in the operator response to successfully recover from the library being powered on.

Source: Object access method (OAM)

System Action: When the library completes the power on sequence, the library controller considers the library and all drives online and operational. This may not match what OAM remembers as the last state of each device. All drives that were not busy at the time the power on sequence completed, will be marked not operational along with the library. Drives that were currently processing request, will be allowed to time out.

Operator Response: Vary all drives online. After this is accomplished, vary library *library-name* online.

System Programmer Response: None.

CBR3008E Library *library-name* **has serial number** *serial-number* **and model number** *model-number***, which does not match the model number** *model-number* **defined in the Library Table.**

Explanation: Library *library-name* has a serial number of *serial_number* and a model number of *model-number* defined in the Vital Product Data of the controller. However, the MVS host system has the library *library-name* defined with model number *model-number* in the Library Table in the DB2 configuration database. The library cannot be used.

Source: Object access method (OAM)

System Action: The library is marked not operational. Pending library requests are purged.

Operator Response: Contact hardware support.

System Programmer Response: Make sure the library has the proper value defined in the Vital Product Data on the controller. Make sure the Library Table in the DB2 configuration database has the correct model number defined for the library.

CBR3009I The CE maintenance mode has been {entered|exited} on library *library-name***.**

Explanation: OAM has received an attention from library *library-name* indicating that the CE maintenance mode has either been entered or exited.

Source: Object Access Method (OAM)

System Action: If the CE maintenance mode has been entered, OAM will mark all drives and library *library-name* not operational.

Operator Response: If the CE maintenance mode has been entered, all drives and library *library-name* should have already been varied offline. If this is not the case, do so now.

If the CE maintenance mode was exited, vary all drives in the library online. Once this is accomplished, vary library *library-name* online.

CBR3010I Volume *volser* **ejected from library** *library-name***. Place in shelf location** *shelfloc***.**

Explanation: Volume *volser* has been ejected from library *library-name*.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

Operator Response: Remove the tape cartridge and store it at the system-specified shelf location.

CBR3011I Secure checkpoint volume *volser* **ejected from library** *library-name***. Place in shelf location** *shelfloc***.**

Explanation: A secure checkpoint volume *volser* has been ejected from library *library-name*.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

Operator Response: Remove the tape cartridge and store it at the system-specified shelf location.

CBR3012I Volume *volser* **ejected from library** *library-name***.**

Explanation: Volume *volser* has been ejected from library *library-name*. This message is issued to the ISMF storage administrator who originated the eject request.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

CBR3013I Secure checkpoint volume *volser* **ejected from library** *library-name***.**

Explanation: A secure checkpoint volume *volser* has been ejected from library *library-name*. This message is issued to the ISMF storage administrator who originated the eject request.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

CBR3014I Eject processing completed for volume *volser***. Reentry into library** *library-name* **detected.**

Explanation: Eject completion message processing for volume *volser* has completed. During processing of the eject completion message, it was detected that volume *volser* had been reentered into library *library-name*.

Source: Object Access Method (OAM)

System Action: The volume record for this volume in the TDCB remains set to the library in which the volume was reentered.

CBR3015I Entry default data class for manual tape library *library-name* **is not valid.**

Explanation: The entry default data class for manual tape library *library-name* contains media interchange values that are not supported in a manual tape library. The manual tape library currently supports MEDIA1 and MEDIA2 tape volumes and 18-track and 36-track recording technologies.

Source: Object Access Method (OAM)

System Action: Library initialization continues. The default media type and recording technology are set to UNKNOWN.

System Programmer Response: To set different defaults, use the ISMF data class application to define a data class with the desired values for tape recording technique and media type. If the default values are acceptable, no action is required. Also, the cartridge entry installation exit (CBRUXENT) can be used to set the tape device selection information.

CBR3090I Null mount time detected in module *modname*

Explanation: As OAM is gathering SMF data regarding volume mount times, a null mount start time has been encountered. In this event, the mount start time used for the SMF record will be an assumed mount time that is captured upon entering the module detecting the null mount start time. This mount time is a substitute for what was expected to be the true mount time, and it will serve as the best available time that can be generated when this condition has been detected.

Source: Object Access Method (OAM)

System Action: OAM processing continues. The SMF record will be generated using the assumed mount start time and the actual mount stop time.

System Programmer Response: None.

CBR3100I Jam in library *library-name*, fault code *nnn*.

Explanation: A command was issued to perform a library function; however, the command could not complete because of a jam in the library *library-name* mechanism. The fault code *nnn* describes what mechanism is at fault.

Source: Object access method (OAM)

System Action: The library is marked not operational and cannot be used again until it is VARYed back online.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3101I No slot available to store the cartridge in library *library-name*.

Explanation: Two situations can cause this message. Either a cartridge is entered into the I/O station when no slots are free in the library or the search for an empty slot to store the cartridge which is currently in the gripper has failed. Normally the latter should not happen and reflects that the SLOT table and OLIBRARY table do not match what is in library *library-name*.

Source: Object access method (OAM)

System Action: In the former case, a request to remove the cartridge is issued and the enter request is rejected. In the latter case, the library is marked not operational and pending library requests are purged, except for the specific situation when the condition occurs during 9246 library initialization or vary online processing. In this situation the cartridge is ejected and the library is marked operational.

Operator Response: If entering a cartridge, remove it. Start Library Management by entering the operator command F OAM,START,LIBMGT, *library-name*. If Library Management does not free a slot for the cartridge, notify the storage administrator.

System Programmer Response: Check the tables against the contents of the library. If a cartridge has been left in the gripper, have a service representative remove it. Obtain the logrec data set error record.

CBR3102I Hardware component unusable in library *library-name*. Service required, fault code *nnn*.

Explanation: A command was issued to perform a library function; however, the command failed due to a hardware malfunction. Fault code *nnn* details what mechanism is at fault in library *library-name*.

Source: Object access method (OAM)

System Action: The component is marked not operational and the error is marked permanent.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3103I Slot *slot-name* in library *library-name* indicates it is full, fault code *nnn*.

Explanation: A Store command was issued to put a cartridge in storage slot *slot-name* in library *library-name*; however, sensors indicate that the slot is full. The resulting fault code was *nnn*.

Source: Object access method (OAM)

System Action: The slot is marked not operational. The cartridge is stored in another slot.

Operator Response: Check the optical configuration database to see if the slot is indeed full. If it indicates it is empty, contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3104I Drive *drive-number* in library *library-name* failed to load, fault code *nnn*.

Explanation: An Insert command was issued but library *library-name* indicated that the cartridge did not go all the way into drive *drive-number*. The resulting fault code was *nnn*.

Source: Object access method (OAM)

System Action: The drive is marked not operational and cannot be used again until it is online.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3105I Drive *drive-number* in library *library-name* failed to unload, fault code *nnn*.

Explanation: A Retract command was issued to library *library-name* but drive *drive-number* failed to unload the cartridge. The resulting fault code was *nnn*.

Source: Object access method (OAM)

System Action: The drive is marked non-operational and the error is marked permanent. The drive cannot be used until it is online.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3106I Tables describing library *library-name* may be invalid, fault code *nnn*.

Explanation: A command was issued to library *library-name*, but the slot, drive or picker was in an unexpected state. The resulting fault code was *nnn*.

Source: Object access method (OAM)

System Action: Return a permanent error to the caller.

Operator Response: Notify the storage administrator of the error.

System Programmer Response: Use DB2 to get the tables in synchronization with the library. Obtain the logrec data set error record.

CBR3107W OAM I/O driver could not obtain storage while processing for *name*.

Explanation: When a library or drive *name* command was issued, there was insufficient storage for the I/O driver in subpool 245. This is a severe problem and most likely indicates a re-IPL is necessary.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Get a dump and determine what component is using up the storage in SQA. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR3108I Invalid parameter list to the OAM I/O driver for *name*.

Explanation: When a library or drive *name* command was issued, there was an error in the parameter list passed to the I/O driver. This is a program problem.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the source of the failure and notify the service representative. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR3109I The OAM I/O driver was unable to establish an ESTAE while processing for *name*.

Explanation: When a library or drive *name* command was issued, there was an error in the I/O driver in establishing an ESTAE.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the source of the failure and notify the service representative. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR3110I An I/O error occurred on the channel to channel adapter *unit-number*, error code *error-code*.

Explanation: When a channel command was issued, there was an I/O error *error-code* on the channel to channel adapter *unit-number*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the source of the failure and notify the service representative. Error codes are listed below.

- Error Code 4 - Incorrect residual byte count
- Error Code 14 - Unmatched message ID from library
- Error Code XX - IOS completion code (IOSCOD)

Note: Refer to control block IOSB in *OS/390 MVS Data Areas, Vol 2 (DCCB-ITTCTE)* for IOSCOD return code definitions.

CBR3111I The OAM I/O driver timed out because a {Library|Drive} command for *lib/drv-name* was rejected.

Explanation: An error occurred when a *library/drive* command was issued for *library-name/drive-name*. The device controller did not respond within 30 seconds and the I/O driver timed out. Either the device controller or the library is in error.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

System Programmer Response: Determine the source of the failure and notify the service representative. Obtain the logrec data set error record.

CBR3112I OAM I/O driver abended with a code of *xxx* when issuing a command for *name*.

Explanation: When a library or drive *name* command was issued, the I/O driver abended with the specified ABEND code *xxx*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

System Programmer Response: Determine the source of the failure and notify the service representative. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Format the SVC dump with the Interactive Problem Control System (IPCS). Obtain the logrec data set error record.

CBR3113I Drive *drive-number* in library *library-name* not operational.

Explanation: An Insert command was issued but library *library-name* indicated that the door of drive *drive-number* was closed, which implies a fault or no power.

Source: Object access method (OAM)

System Action: The drive is marked not operational and cannot be used until it is VARYed back online.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3114I Single-sided cartridge in library *library-name* invalid.

Explanation: A fault code 148 or 248 has been received from library *library-name*. Gripper 1 or gripper 2, respectively, senses that a cartridge is single-sided and is trying to insert the opposite side.

Source: Object access method (OAM)

System Action: The error is treated as permanent.

Operator Response: If the cartridge remains in the library, try issuing the LIBRARY EJECT command to get the cartridge out of the library. Once the cartridge has been removed, verify that the cartridge is dual-sided before trying to reenter it.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3115I The OAM I/O driver timed out waiting for a response from {Library|Drive} *library-name/drive-name*.

Explanation: When implementing a library or drive command, the device controller did not respond within 30 minutes for a library calibrate command or 5 minutes for all other commands. Either the device controller or the library is in error.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the source of the failure and notify the service representative. Obtain the logrec data set error record.

CBR3116I J33 missing in the plug panel for library *library-name*.

Explanation: As a result of service or a jam on library *library-name*, the J33 pin was inadvertently left out of the plug at the plug panel. The fault code is 124.

Source: Object access method (OAM)

System Action: The command is rejected.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the SYS1 LOGREC error record.

CBR3117I Channel to channel adapter *unit-number* OFFLINE.

Explanation: When a library or drive command was issued, the I/O driver found that channel to channel adapter *unit-number* was OFFLINE.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Vary channel to channel adapter *unit-number* ONLINE.

CBR3120I Unable to obtain fault status for library *library-name*. Error recovery canceled.

Explanation: When status from a command for library *library-name* was obtained showing a fault or fatal error, the Request Fault Status command failed causing error recovery to stop.

Source: Object access method (OAM)

System Action: The library is marked not operational and the error is marked permanent.

Operator Response: Notify the system programmer. Contact hardware support.

System Programmer Response: Determine if hardware or software error and notify the service representative. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR3122I Volumes *volser-1* and *volser-2* were ejected from library *library-name*, shelf location is *shelfloc*.

Explanation: The request to eject volumes *volser-1* and *volser-2*, from library *library-name* completed successfully. A cartridge has been placed in the library's I/O station. If the volume serial number or shelf location is unknown at this time, '??????' is substituted in the message.

If the cartridge was ejected as a part of reinitialization of expired write-once media, and there was no shelf location already known for the cartridge at the time of ejection, the reserved shelf location of '??????' is supplied by the system.

Source: Object access method (OAM)

System Action: The records in the optical configuration database are updated to show that these volumes now reside outside of the library.

Operator Response: Remove the cartridge from the library's I/O station and return it to the specified shelf location.

CBR3123I Eject of volumes *volser-1* and *volser-2* from library *library-name* failed.

Explanation: The request to eject volumes *volser-1* and *volser-2*, from library *library-name* failed. If the volume serial number is unknown at this time, '??????' is substituted in the message.

Source: Object access method (OAM)

System Action: The cartridge remains in the library.

Operator Response: Do not attempt to repeat the eject until the cause of the failure has been corrected. Refer to a preceding CBR3XXX message(s) for the cause of the failure.

System Programmer Response: Notify the service representative.

CBR3124I Eject of volume *volser* on drive *drive-name* in library *library-name* pending.

Explanation: The operator has entered a cartridge into the I/O station of library *library-name*. An error has occurred during volume entry scheduler processing for volume *volser* and due to a subsequent library or drive error, the volume on drive *drive-name* could not be ejected at this time. The volume will be ejected on a subsequent mount, demount or vary online of this drive.

Source: Object access method (OAM)

System Action: The optical disk can not be ejected from the library at the present time. OAM will continue processing.

CBR3126I Unable to schedule {mount | demount | flip | enter | eject | start | stop | audit | remap | export completion} request to library *library-name*, {I/O station not operational | ESTAE failure | STORAGE OBTAIN failure}.

Explanation: A mount, demount, flip, enter, eject, start, stop, audit, remap or export completion request has been made to library *library-name*. The request failed for one of the following reasons:

- The I/O station is not operational.
- An ESTAE request failed.
- A STORAGE OBTAIN request failed.

Source: Object access method (OAM)

System Action: For an ESTAE or STORAGE OBTAIN failure, message CBR7010I or message CBR7004I was already issued.

Operator Response: If the I/O station is not operational, contact hardware support. Otherwise, contact the systems programmer.

System Programmer Response: For an ESTAE failure see message CBR7010I, and for a STORAGE OBTAIN failure see message CBR7004I.

CBR3127I Volumes *volser-1* and *volser-2* were ejected from library *library-name*.

Explanation: The request to eject volumes *volser-1* and *volser-2*, from library *library-name* completed successfully. The request was made by an ISMF storage administrator. An optical disk cartridge has been placed in the library's I/O station.

Source: Object access method (OAM)

System Action: The records in the optical configuration database are updated to show that these volumes now reside outside of the library.

CBR3130I Library adapter not responding for library *library-name***.**

Explanation: An I/O operation was issued to library *library-name* but the Library Adapter returned a return code of X'02' indicating not responding.

Source: Object access method (OAM)

System Action: The library command is retried from a different port. If it fails a second time, the library is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on adapter errors, consult *Asynchronous Adapter Device Driver Table*. Obtain the logrec data set error record.

CBR3131I Library adapter function call unknown to library *library-name***.**

Explanation: An I/O operation was issued to library *library-name* but the Library Adapter returned a return code of X'01' indicating the function call was unknown or unsupported.

Source: Object access method (OAM)

System Action: The library is marked not operational and the command is failed.

Operator Response: Contact hardware support.

System Programmer Response: For information on adapter errors, consult *Asynchronous Adapter Device Driver Table*. Discover from the logrec data set what command was issued. Obtain the logrec data set error record.

CBR3132I Library adapter function call rejected. No acknowledgement from library *library-name***.**

Explanation: An I/O operation was issued to library *library-name* but the Library Adapter returned a return code of X'03' indicating the library returned a "NACK" (no acknowledgement) to the function call.

Source: Object access method (OAM)

System Action: The library command is retried from a different port. If it fails a second time, the library is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on adapter errors, consult *Asynchronous Adapter Device Driver Table*. Obtain the logrec data set error record.

CBR3133I Library adapter function call rejected. Library *library-name* **not responding.**

Explanation: An I/O operation was issued to library *library-name* but the Library Adapter returned a return code of X'04' indicating the library is not responding to the function call.

Source: Object access method (OAM)

System Action: The library command is retried from a different port. If it fails a second time, the library is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on adapter errors, consult *Asynchronous Adapter Device Driver Table*. Obtain the logrec data set error record.

CBR3134I Library *library-name* **communications not enabled.**

Explanation: An I/O operation was issued to library *library-name* but the Library Adapter returned a return code of X'05' indicating that library communications were not enabled.

Source: Object access method (OAM)

System Action: The library command is retried from a different port. If it fails a second time, the library is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on adapter errors, consult *Asynchronous Adapter Device Driver Table*. Obtain the logrec data set error record.

CBR3135I Library adapter function call unknown error using library *library-name***.**

Explanation: An I/O operation was issued to library *library-name* but the Library Adapter returned a nonsupported return code indicating that an unknown error occurred while processing a function call.

Source: Object access method (OAM)

System Action: The library is marked not operational and the command is failed.

Operator Response: Contact hardware support.

System Programmer Response: For information on adapter errors, consult *Asynchronous Adapter Device Driver Table*. Obtain the logrec data set error record.

CBR3136I Library adapter function call internal error using library *library-name***.**

Explanation: An I/O operation was issued to library *library-name* but the Library Adapter returned a return code of X'08' indicating that no pending messages in the receive message buffer found while processing a function call.

Source: Object access method (OAM)

System Action: The library is marked not operational and the command is failed.

Operator Response: Contact hardware support.

System Programmer Response: For information on adapter errors, consult *Asynchronous Adapter Device Driver Table*. Obtain the logrec data set error record.

CBR3137I Incomplete message sent from library *library-name***.**

Explanation: The library adapter has determined that library *library-name* has sent an incomplete message to the adapter and is now unable to continue. This error is either a '0A'x or '0C'x from the library adapter.

Source: Object access method (OAM)

System Action: The library is marked not operational and the command is failed.

Operator Response: Contact hardware support.

System Programmer Response: Obtain the logrec data set error record.

CBR3198I Offline or unknown status *status* from library *library-name*.

Explanation: Library *library-name* returned status *status* that is either unknown or says the service representative has issued a Listen command.

Source: Object access method (OAM)

System Action: The library is marked not operational and the command is failed.

Operator Response: Contact hardware support.

System Programmer Response: Obtain the logrec data set error record.

CBR3199I Unsupported fault code for library *library-name*.

Explanation: A fault occurred for library *library-name* that is not yet supported. Thus it is treated as a permanent error until supported.

Source: Object access method (OAM)

System Action: The error is treated as permanent.

Operator Response: Keep the console information and notify the service representative.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3200I A permanent error occurred in Library *library-name*, status *status*, fault code *fff*, failing command *command*.

Explanation: While command *command*, in library *library-name* was being carried out, fault code *fff*, status *status* occurred for which the ERP could not recover. See the secondary error message for an explanation of the fault code.

Source: Object access method (OAM)

System Action: See the secondary error message system action.

Operator Response: See the secondary error message operator action. Contact hardware support.

System Programmer Response: See the secondary error message programmer response. Obtain the logrec data set error record.

CBR3201I The I/O station in library *library-name* is no longer usable.

Explanation: An I/O error has occurred while a library command was being issued. Library *library-name* returned a fault 044 indicating that an input command was received but the I/O station does not contain a cartridge. After receiving a fault 044, even though the operator has inserted a cartridge into the I/O station, the cartridge may no longer be properly positioned in the I/O station.

Source: Object access method (OAM)

System Action: The I/O station is marked not operational causing all subsequent entry and eject requests to fail until the library is VARYed offline and then back online.

Operator Response: If there is a cartridge present in the I/O station, remove it. VARY the library offline and then back online and reinsert the cartridge into the I/O station. If the problem recurs, contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3202I Invalid command *command* to library *library-name* status *status*.

Explanation: An I/O error has occurred implementing library command *command*. Library *library-name* returned status of E indicating that it detected an invalid command. The failing command and the complete library status *status* are displayed. The cartridge is left in the gripper and can be stored or removed by varying the library off and then back online.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR3203I Interrupt control circuitry fault on library *library-name*.

Explanation: An I/O error has occurred while a library command was being issued. Library *library-name* returned a fault 008 indicating that it detected a fault in the interrupt control circuitry.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3204I Multiple timer interrupt fault in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 009 indicating that it received a second interrupt without finishing an earlier one on the same timer.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3205I Gripper 1 rear limit sensor fault in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 021 indicating that gripper 1 exceeded the maximum step count when single stepping from rear limit sensor after getting a cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3206I Gripper 2 rear limit sensor fault in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 022 indicating that gripper 2 exceeded the maximum step count when single stepping from rear limit sensor after getting a cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3207I Gripper front sensor fault in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 047 indicating that the gripper does not reach the front sensor location when trying to get a cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3208I Gripper full sensor fault in library *library-name***, fault code** *nnn***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault *nnn* indicating that the gripper full sensor is intermittent.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3209I Full sensor fault on drive *drive-number* **in library** *library-name***, fault code** *nnn***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault *nnn* indicating that the full sensor on drive *drive-number* is intermittent.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3210I Disk load solenoid fault on drive *drive-number* **in library** *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 062 indicating that the disk load solenoid on drive *drive-number* did not open the drive door while implementing an Insert command.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3211I Both grippers failed fault in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 125 indicating that both grippers failed flags were set.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3212I Gripper undetermined fault in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 126 indicating that a gripper full sensor was read twice and gave different results.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3213I Gripper 1 limit sensor fault in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 141 indicating that during implementation of a Home command both gripper 1 limit sensors were on at once.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3214I Gripper 2 limit sensor fault in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 142 indicating that during implementation of a Home command both gripper 2 limit sensors were on at once.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3215I Electronic Self Test failed. Output port 1 in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 201 indicating that during electronic self test a failure was detected in output port 1.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3216I Electronic Self Test failed. Output port 2 in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 202 indicating that during electronic self test a failure was detected in output port 2.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3217I Electronic Self Test failed. Output port 3 in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 203 indicating that during electronic self test a failure was detected in output port 3.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3218I Electronic Self Test failed. Output port 4 in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 204 indicating that during electronic self test a failure was detected in output port 4.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3219I Electronic Self Test failed. Output port 5 in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 205 indicating that during electronic self test a failure was detected in output port 5.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3220I Electronic Self Test failed. RAM chip 1D in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 206 indicating that during electronic self test a failure was detected in the Ram chip in location 1D on the CPU board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3221I Electronic Self Test failed. RAM chip 2D in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 207 indicating that during electronic self test a failure was detected in the Ram chip in location 2D on the CPU board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3222I Electronic Self Test failed. RAM chip 1E in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 208 indicating that during electronic self test a failure was detected in the Ram chip in location 1E on the CPU board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3223I Electronic Self Test failed. RAM chip 2E in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 209 indicating that during electronic self test a failure was detected in the Ram chip in location 2E on the CPU board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3224I Electronic Self Test failed. Timer chip 1B in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned fault 211 or 218 indicating that during electronic self test a failure was detected in the Timer chip in location 1B on the CPU board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3225I Electronic Self Test failed. Timer chip 7L in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 212 indicating that during electronic self test a failure was detected in the Timer chip in location 7L on the I/O board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3226I Electronic Self Test failed. Counter chip 8L in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 213 indicating that during electronic self test a failure was detected in the Counter chip in location 8L on the I/O board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3227I Electronic Self Test failed. Timer chip 7L or bus interrupt module 5L in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 214 indicating that during electronic self test a failure was detected in generating an interrupt from the timer chip in location 7L on the CPU board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3228I Electronic Self Test failed. Timer chip 8L or bus interrupt module 5L in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 215 indicating that during electronic self test a failure was detected in generating an interrupt from the timer chip in location 8L on the CPU board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3229I Electronic Self Test timers out of synch in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 217 indicating that during electronic self test there was a greater than 10% difference in timers.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3230I Electronic Self Test failed. Bus interrupt module 5L in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 221 indicating that during electronic self test a failure was detected in controlling the Bus Interrupt Module in location 5L on the I/O board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3231I Electronic Self Test failed. UART chip 2B in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 222 indicating that during electronic self test a failure was detected in controlling the UART chip in location 2B on the CPU board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*.

CBR3232I Electronic Self Test failed. DUART chip 1E in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 223 indicating that during electronic self test a failure was detected in controlling the DUART chip in location 1E on the I/O board.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3233I Electronic Self Test failed EPROM check in library *library-name***.**

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 231 indicating that during electronic self test a checksum was calculated for the EPROM and found to be different than the recorded time of manufacture.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3235I Gripper full sensor intermittent in library *library-name***.**

Explanation: A fault 041 or 341 occurred in library *library-name* which states that the gripper 1 or gripper 2 respectively thinks a cartridge is held and thus will not perform the command.

Source: Object access method (OAM)

System Action: The error is treated as permanent.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3236I Horizontal limit failure in library *library-name***.**

Explanation: A fault occurred in library *library-name* which indicates that a failure occurred with a horizontal limit sensor.

Source: Object access method (OAM)

System Action: The request is rejected and the failing component is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3237I Vertical limit failure in library *library-name***.**

Explanation: A fault occurred in library *library-name* which indicates that a failure occurred with a vertical limit sensor.

Source: Object access method (OAM)

System Action: The request is rejected and the failing component is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3238I Pivot limit failure in library *library-name***.**

Explanation: A fault occurred in library *library-name* which indicates that a failure occurred with a pivot limit sensor.

Source: Object access method (OAM)

System Action: The request is rejected and the failing component is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3239I I/O slot full sensor failure in library *library-name***.**

Explanation: A fault occurred in library *library-name* which indicates that, after an OUTPUT command, the I/O station slot sensor does not indicate full.

Source: Object access method (OAM)

System Action: The request is rejected and the failing component is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3240I Slot full sensor failure in library *library-name***.**

Explanation: A fault occurred in library *library-name* which indicates that, after a STORE command, the slot full sensor does not indicate full.

Source: Object access method (OAM)

System Action: The request is rejected and the failing component is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3241I Gripper center of alignment not found in library *library-name*.

Explanation: While implementing a command in library *library-name* to find the center of alignment target, the start or the end of the target was not found.

Source: Object access method (OAM)

System Action: The request is rejected and the failing component is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3242I EEPROM checksum error in library *library-name*.

Explanation: A fault occurred in library *library-name* which indicates that the checksum calculated for the EEPROM does not match the one previously saved or was never initialized.

Source: Object access method (OAM)

System Action: The request is rejected and the failing component is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3243I RAM update failure in library *library-name*.

Explanation: An attempt to update a portion of the RAM failed in library *library-name*.

Source: Object access method (OAM)

System Action: The request is rejected and the failing component is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3244I Drive *drive-number* was not spun down before retract in library *library-name*.

Explanation: During a retract from a drive, library *library-name* detected that drive *drive-number* was not stopped.

Source: Object access method (OAM)

System Action: This is a logical error such that the drive cannot be used.

Operator Response: Contact your system programmer. Contact hardware support.

System Programmer Response: Obtain the logrec data set error record.

CBR3245I Gripper 1 failed during retry of Store command in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 025, indicating that the retry of the Store command or the store portion of the Select and Exchange command failed when using gripper 1.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3246I Gripper 2 failed during retry of Store command in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 325, indicating that the retry of the Store command or the store portion of the Select and Exchange command failed when using gripper 2.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3247I Gripper 1 failed during retry of Output command in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 081, indicating that the retry of the Output command or the output portion of the Input and Exchange command failed when using gripper 1.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3248I Gripper 2 failed during retry of Output command in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 381, indicating that the retry of the Output command or the output portion of the Input and Exchange command failed when using gripper 2.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3249I Gripper 1 failed during retry of Insert command in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 082, indicating that the retry of the Insert command or the insert portion of the Retract and Exchange command failed when using gripper 1.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3250I Gripper 2 failed during retry of Insert command in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 382, indicating that the retry of the Insert command or the insert portion of the Retract and Exchange command failed when using gripper 2.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3251I Gripper 1 full sensor fault occurred selecting a cartridge in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 155, indicating that while selecting a cartridge using gripper 1, both the gripper full and slot full sensors indicated that they did not have the cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3252I Gripper 2 full sensor fault occurred selecting a cartridge in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 156, indicating that while selecting a cartridge using gripper 2, both the gripper full and slot full sensors indicated that they did not have the cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3253I Gripper 1 slot full sensor and aligned sensor could not find the end of target in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 084, indicating that neither the gripper 1 slot full sensor nor the gripper 1 aligned sensor could find the end of target during pivot alignment sequence.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3254I Gripper 1 aligned sensor could not find the end of target in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 158, indicating that while performing the pivot alignment sequence at a storage rack, the gripper 1 aligned sensor could not find the end of target.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3255I Gripper 1 slot full sensor could not find the end of target in library *library-name*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 159, indicating that while performing the pivot alignment sequence at a storage rack, the gripper 1 slot full sensor could not find the end of target.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3256I Cartridge jammed in library *library-name* between the gripper and drive *drive-number*.

Explanation: An I/O error has occurred implementing a library command. Library *library-name* returned a fault 235 or 236, indicating that during implementation of a retract command or the retract portion of a retract and exchange command, the cartridge got jammed between the gripper and drive *drive-number*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped and the library is left in an unusable state until the cartridge is removed and the library is VARYed back online.

Operator Response: Contact hardware support.

System Programmer Response: For information on library errors, consult *Filenet OSAR Library Unit Product Description*. Obtain the logrec data set error record.

CBR3300I Possible I/O error on {library|drive|volume} *library-name/drive-name/volser*, *return-code*, *fsc*, *sense-data*.

Explanation: An I/O error occurred on {library|drive|volume} *library-name/drive-name/volser*.

Source: Object access method (OAM)

System Action: None.

Operator Response: Message CBR3301I, which displays the failing command packet, and another error message detailing the error will follow. Look up the message(s) in this manual for any further actions to be performed.

CBR3301I *sub-order*, *volser-1*, *category*, *volser-2*, *paclen*, *pacdatl*, *pacid*, *paclibid*, *pacdrvid*, *paclibf*, *paclstat*, *pacdrvf*, *pacdstat*, *volser-3*, *volser-4*, *pacmedtyp*.

Explanation: OAM error recovery procedure detected an unrecoverable input/output error for a 3995 Library.

In the message text:

sub-order The command to be processed for the addressed device.

volser-1 The volume serial number to be used with the sub-order.

category Command specific category or attribute.

volser-2 Alternate volume serial number (opposite-side volume).

paclen Total packet length.

pacdatl Total number of bytes either sent by the host or expected to be sent by the controller.

pacid Specifies whether the command is to or from the host.

- X'50' - from the host with no data.
- X'55' - from the host with data.
- X'A0' - to the host with no data.
- X'AA' - to the host with data.

paclibid Directs a command to the 'A' or 'B' library.

- X'01' - library 'A'.
- X'02' - library 'B'.

pacdrvid Directs a command to a specific drive.

paclibf Library flags used by the 3995 controller (command specific).

paclstat Library status field (command specific).

pacdrvf Drive flags used by the 3995 controller (command specific).

pacdstat Drive status field (command specific).

volser-3 New volume serial number for currently mounted volume during a format command.

volser-4 New volume serial number for alternate side of currently mounted volume during a format command.

pacmedtyp Media type information for volume.

Source: Object access method (OAM)

System Action: None.

CBR3302I Unsupported return code *return-code* **received from controller.**

Explanation: The 3995 controller returned a return code *return-code* that is not recognized by OAM.

Source: Object access method (OAM)

System Action: The I/O operation is stopped and the device that the command was sent to is now not operational.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR330OI message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3303I Duplicate volume label detected on drive *drive-name*.

Explanation: A duplicate volume label was detected on drive *drive-name*.

Source: Object access method (OAM)

System Action: If drive *drive-name* is a library resident drive, an audit review will be performed to determine if the volume is a true duplicate. If the drive is an operator accessible drive, the volume will be demounted.

CBR3304I Volume *volser* **has failed consecutive requests.**

Explanation: Volume *volser* failed the current request on this drive as well as a previous request on another drive.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. An attempt is made to recover the failed drives, if no operator action has taken place (e.g., vary online or offline) on the drive since the first failure.

Operator Response: Notify the system programmer.

System Programmer Response: Examine the system log and compare the previous failure to the current one. Determine if any further action is necessary. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the previous message CBR3300I was issued for this failure and the sense data displayed is not all zeroes, then obtain the SYS1.LOGREC error record.

CBR3305I Audit review in progress in library *library-name*.

Explanation: A duplicate volume label was detected upon volume entry into library *library_name*. To determine if this is truly a duplicate volume, an audit review command was issued to the library. This action will take approximately 3 to 5 minutes and all requests to the library and its drives (including operator accessible drives) are delayed while the audit review is implementing.

Source: Object access method (OAM)

System Action: If determined that the volume entered into library *library-name* is truly a duplicate, it will be ejected. If the volume is not a duplicate, the volume is entered into the library. If an error occurs during processing, the volume will be treated as a duplicate and ejected from the library.

CBR3306I The I/O station in library *library-name* **is no longer usable.**

Explanation: An I/O error has occurred in library *library-name* that rendered the I/O station unusable.

Source: Object access method (OAM)

System Action: The I/O station is marked not operational, causing all subsequent enter and eject requests to fail until the library is varied offline and then back online.

Operator Response: Vary the library offline and then back online. If the I/O station continues to fail, contact hardware support.

System Programmer Response: Check the system log for previous messages that may have been issued giving details on the exact failure. If the previous message CBR3300I was issued for this failure and the sense data displayed is not all zeroes, then obtain the SYS1.LOGREC error record.

CBR3307I One or more devices failed during the remap of library *library-name*.

Explanation: During the remap of library *library-name*, one or more devices failed.

Source: Object access method (OAM)

System Action: If library *library-name* failed during remap, it will be marked not operational. All drives that failed during the remap will also be marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: Obtain the SYS1.LOGREC error record.

CBR3308I The I/O station door in library *library-name* is open.

Explanation: An error has occurred attempting to eject a cartridge from library *library-name* because the I/O station door is open.

Source: Object access method (OAM)

System Action: Eject requests for this library fail.

Operator Response: Close the I/O station door. If the I/O station door was already closed, contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3309E *dddd*, {ACCESSOR | CONTROLLER | DRIVE | MEDIA | UNKNOWN} {SERVICE | MODERATE | SERIOUS | ACUTE | UNKNOWN} ALERT ON LIBRARY=*lib-name*, MT=*device-type*, SERIAL=*mmpp-ssssss*, DRIVE=*drive-name*, VOLSER=*volser*, ACTION={NONE | CLEAN | REPLACE | REPAIR}, REFCODE=*tttt ffff*

Explanation: OAM received an unsolicited attention message from a 3995 optical library dataserver. The unsolicited attention message type indicates an 3995 optical library dataserver service information message (SIM) indicating that a component within the 3995 optical library dataserver is malfunctioning.

The component requiring service is defined as:

ACCESSOR Optical library robotic accessor.

CONTROLLER Optical library controller.

DRIVE Optical drive.

MEDIA Optical disk media.

UNKNOWN The optical library dataserver did not identify a valid component.

The severity of the Service Information Message (SIM) is defined as:

SERVICE The optical library dataserver needs service.

MODERATE The optical library dataserver needs service. Performance or availability is being impacted by the malfunction.

SERIOUS The optical library dataserver needs service. Performance or availability is being severely impacted by the malfunction.

ACUTE The optical library dataserver needs immediate service and is not capable of functioning.

UNKNOWN The optical library dataserver did not identify a valid severity.

In the message text:

dddd MVS device number, associated with the 3995 optical library dataserver, on which the unsolicited attention message was received.

lib-name Name of the failing 3995 optical library dataserver.

device-type Machine type and model number of the failing 3995 optical library dataserver, in the form ***tttt-mmm***, where ***tttt*** is the machine type (3995) and ***mmm*** is the model number.

mm Manufacturer identifier of the 3995 optical library dataserver.

pp Plant of manufacture for the 3995 optical library dataserver.

ssssss Serial number of the 3995 optical library dataserver.

drive-name Name of the failing drive within the 3995 optical library dataserver.

volser Volume serial number of the failing volume within the 3995 optical library dataserver.

The reference codes listed help the IBM hardware service personnel to identify which parts to bring to service the failing machine.

tttt The first reference code listed is the 3995 optical library dataserver Task Request Block (TRB) return code.

ffff The second reference code listed is the 3995 optical library dataserver Fault Symptom Code (FSC).

Source: Object access method (OAM)

System Action: The 3995 optical library dataserver service information message is logged as an Asynchronous Notification Record (ANR) type X'A3' in SYS1.LOGREC if the hardware unsolicited attention indicates that logging is requested.

Operator Response: Notify the system programmer. After notifying the system programming staff, delete this message from the MVS console using the MVS CONTROL command.

System Programmer Response: Run an Environmental Record, Editing and Printing (EREP) report to format and print the Asynchronous Notification Records for the 3995 optical library dataserver in question. Notify your IBM hardware service and support personnel. Have the MVS console log (containing the CBR3309E message) and the EREP Detailed Edit Report or the EREP System Exception Report available for IBM hardware service and support personnel.

CBR3310I Error with no additional sense in library *library-name*.

Explanation: No sense information describing an error is pertinent. A Request Sense command was sent when no error was outstanding or an error was detected with no associated sense information. If the error was detected when a move command was being implemented, the location of the cartridge being moved may not be known. The cartridge may be lost. If this is the case, the cartridge will be found missing on the next request for that cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3311I Library *library-name* could not become ready.

Explanation: The library *library-name* was in the process of powering up or recovering from a SCSI reset, but could not clear the Not Ready condition.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3312I Element status in library *library-name* needs initialized.

Explanation: The element status needs to be determined before movement operations could occur in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer. Contact hardware support.

System Programmer Response: The 3995 library and OAM configuration tables are corrupted. A remap must be performed before any cartridge movement can be accomplished. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3313I Manual intervention required on library *library-name*.

Explanation: A command requesting library *library-name* to perform an action that required the library to do a movement operation was issued. Previous to this command, the library had responded that it had a hardware error and could not move the carriage and picker assembly.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: See previous error message. Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3314I The source element in library *library-name* was unexpectedly empty.

Explanation: Library *library-name* attempted to retrieve a cartridge from an empty source element. The library Element Status has a status of cartridge in the element.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: The 3995 library and OAM configuration tables are corrupted. A remap is recommended to correct the discrepancy.

CBR3315I Destination element in library *library-name* was unexpectedly full.

Explanation: Library *library-name* attempted to store a cartridge in an element already occupied. The library element status shows that the element is empty.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: The 3995 library and OAM configuration tables are corrupted. A remap is recommended to correct the discrepancy.

CBR3316I ROM checksum error in library *library-name*.

Explanation: An error was detected during a checksum verification test of the ROM in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3317I RAM checksum error in library *library-name*.

Explanation: An error was detected during a RAM checksum verification test in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3318I Microprocessor test error in library *library-name*.

Explanation: A error was detected when performing a functional test of the microprocessor in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3319I Controller RAM checksum error in library *library-name*.

Explanation: The 3995 controller RAM verification failed the checksum test in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3320I Microcode error in library *library-name***.**

Explanation: The library microcode in library *library-name* has detected an error.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3321I SCSI controller register error in library *library-name***.**

Explanation: There is an error with the SCSI controller register in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3322I SCSI controller message error in library *library-name***.**

Explanation: The SCSI controller encountered an error during the message phase in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3323I SCSI controller command and/or data error on {library|drive} *library-name/drive-name***.**

Explanation: The SCSI controller encountered an error during the command phase in {library|drive} *library-name/drive-name*.

Source: Object access method (OAM)

System Action: The {library|drive} is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3324I SCSI controller kill error in library *library-name***.**

Explanation: The SCSI controller detected a kill error in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3325I SCSI controller FIFO error in library *library-name***.**

Explanation: The SCSI controller detected a FIFO error in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3326I SCSI controller target sequence error in library *library-name***.**

Explanation: The SCSI controller detected a target sequence hardware error in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3327I SCSI controller command sequence error in library *library-name***.**

Explanation: A sequence error was detected by the SCSI controller during the command phase in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3328I SCSI controller status sequence error in library *library-name***.**

Explanation: A sequence error was detected by the SCSI controller during the status phase in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3329I Motor control chip compare failure in library *library-name***.**

Explanation: Data written to the motor control chip does not match the data read back in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3330I Motor control chip loop back test failed in library *library-name*.

Explanation: The loop back test failed when writing to the motor control chip in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3331I 12 volt power supply bad in library *library-name*.

Explanation: The 12 volt power supply in library *library-name* is less than 10.2 volts or greater than 14.4 volts.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3332I 26 volt power supply bad in library *library-name*.

Explanation: The 26 volt power supply in library *library-name* is less than 21.0 volts or greater than 32.0 volts.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3333I Drive *drive-name* not connected.

Explanation: Drive *drive-name* is defined in an Active Control Data Set but not installed or the cable is disconnected.

Source: Object access method (OAM)

System Action: The I/O operation is stopped and the drive is marked non-operational.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3334I Command rejected, invalid version id detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid version id.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3335I Command rejected, invalid high speed look up value detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid high speed look up value.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3336I Command rejected, command packet contains an invalid entry in the field PACLEN.

Explanation: The device controller has determined that the command packet contained an invalid value in the field PACLEN.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3337I Unspecified mechanical error in library *library-name*.

Explanation: Unable to identify actual mechanical error in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3338I Unable to free picker fingers in library *library-name*.

Explanation: Unable to free picker fingers in library *library-name* in preparation for carriage motion.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3339I Vertical beams have failed in library *library-name*.

Explanation: All attempts to clear the vertical beams in library *library-name* have failed, suspect cartridge stuck in picker.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Simply varying the library offline and then online will not clear the error. Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3340I Vertical path sensors blocked in library *library-name*.

Explanation: Unable to find the home position in library *library-name* because the vertical path sensors are blocked.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3341I Unable to verify picker position in library *library-name*.

Explanation: Unable to verify that the picker in library *library-name* is at the home position during find home sequence (non-lead-screw side).

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3342I Transfer motion failure in library *library-name*.

Explanation: Library *library-name* detected a transfer motion error during a find home motion.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3343I Carriage motion failure in library *library-name*.

Explanation: Library *library-name* detected a carriage motion failure during find home sequence.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3344I Unable to free picker fingers in library *library-name*.

Explanation: Unable to free picker fingers in library *library-name* in preparation for a translate motion.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3345I Unable to determine which side of the picker is up in library *library-name*.

Explanation: An error was detected in library *library-name* when trying to determine which side of the picker is up.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3346I Flip motion failure in library *library-name*.

Explanation: A failure was detected in library *library-name* during a flip motion during a find home.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3347I Motion error while checking for cartridge in picker in library *library-name*.

Explanation: Library *library-name* detected motion while checking for a cartridge in the picker.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3348I Library *library-name* unable to measure the height of sensor on left side.

Explanation: During calibration, library *library-name* was unable to measure the height of the sensor on the left side.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3349I Library *library-name* unable to measure the height of sensor on right side.

Explanation: During calibration, library *library-name* was unable to measure the height of the sensor on the right side.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3350I Excessive upward tilt on picker in library *library-name*.

Explanation: Excessive tilt of the carriage/picker assembly (toward the sensors) in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3351I Excessive downward tilt on picker in library *library-name*.

Explanation: Excessive tilt of the carriage assembly (toward the sensors) in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3352I Excessive cone angle on picker in library *library-name*

Explanation: If the sum of the upward droop on one side of the picker plus the downward droop on the other side of the picker is too great for proper operation, this is considered excessive cone angle. Library *library-name* detected excessive cone angle on its picker.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3353I Excessive stacker tilt in library *library-name*.

Explanation: The stacker assembly to which the stacker is attached has one side higher than the other in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3354I Library *library-name* was unable to complete an interrupted move at power-up.

Explanation: If a move was interrupted by a power loss, the library will attempt to return to the state before the last command was issued. Library *library-name* was unable to restore itself to the previous state before the last command was issued. It is likely that a cartridge has been removed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer. Contact hardware support.

System Programmer Response: The 3995 library and OAM configuration table are corrupted. A remap is recommended to correct the discrepancy. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3355I Unable to find top of unit in library *library-name*.

Explanation: When the carriage and picker assembly was moved to the top of the library to measure the exact location to the top translate bar, an error was detected by library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3356I Lower left calibration sensor failed in library *library-name*.

Explanation: The lower left calibration sensor in library *library-name* failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3357I Lower right calibration sensor failed in library *library-name*.

Explanation: The lower right calibration sensor in library *library-name* failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3358I Upper left calibration sensor failed in library *library-name***.**

Explanation: The upper left calibration sensor in library *library-name* failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3359I Upper right calibration sensor failed in library *library-name***.**

Explanation: The upper right calibration sensor in library *library-name* failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3360I Left vertical path blocked in library *library-name***.**

Explanation: A cartridge is part way out of an element and is blocking the left vertical path of the carriage and picker assembly in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3361I Right vertical path blocked in library *library-name***.**

Explanation: A cartridge is part way out of an element and is blocking the right vertical path of the carriage and picker assembly in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3362I Left or right vertical beam in library *library-name* **is failing intermittently.**

Explanation: The left (lead-screw side) or right (non-lead-screw side) vertical beam in library *library-name* is failing intermittently.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3363I Right vertical beam too high in library *library-name***.**

Explanation: The light beam on the right stack sensor is too high in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3364I Left vertical beam too high in library *library-name***.**

Explanation: The light beam on the left stack sensor is too high in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3365I Left vertical LED failed in library *library-name***.**

Explanation: The left vertical LED in library *library-name* failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3366I Right vertical LED failed in library *library-name***.**

Explanation: The right vertical LED in library *library-name* failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3367I Left vertical sensor failed in library *library-name***.**

Explanation: The left vertical sensor in library *library-name* has failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3368I Right vertical sensor failed in library *library-name***.**

Explanation: The right vertical sensor in library *library-name* has failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3369I Vertical sensor system failed in library *library-name***.**

Explanation: The right and left vertical sensors in library *library-name* have failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3370I Input/output station in library *library-name* **will not rotate inward.**

Explanation: Cannot rotate the I/O station in library *library-name*

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Check input/output station for a cartridge not inserted in all the way. If a cartridge is found partially inserted, push the cartridge the rest of the way into the input/output station. If the cartridge is not taken into library and the error persists, contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3371I Front input/output station sensor in the input/output station failed in library *library-name***.**

Explanation: The front sensor inside the I/O station, that senses if a cartridge is present, has failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3372I Input/output station in library *library-name* **will not accept or release a cartridge.**

Explanation: The I/O station in library *library-name* will not accept a cartridge when the picker tries to put one in the I/O station, or the picker cannot remove a cartridge that is in the I/O station.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3373I A slot in library *library-name* **will not accept or release a cartridge.**

Explanation: A slot in library *library-name* will not accept or release a cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

If the cartridge could not be stored away, the library will attempt to return the cartridge to the drive. However, in the event the library was unable to return the cartridge to the drive, library *library-name* will be marked not operational.

If the slot would not release the cartridge, the volume will be marked as stuck in the slot.

Operator Response: If the cartridge could not be stored away, eject the cartridge and inspect it for damage. It is likely that the cartridge has been damaged and the library is unable to store the cartridge away. If the cartridge appears in satisfactory condition, contact hardware support.

If the cartridge is in the picker or stuck in the slot, contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3374I Drive *drive-name* **will not load.**

Explanation: The library was unable to load a cartridge into drive *drive-name*.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3375I Drive *drive-name* **has failed to set the busy status.**

Explanation: A cartridge has been inserted into drive *drive-name*, but the drive has failed to set the busy status.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the

previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3376I Library *library-name* failed power on self test.

Explanation: Library *library-name* failed diagnostics upon power up.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3377I Command rejected, access to a device or volume was denied.

Explanation: The command was rejected for one of the following reasons:

1. The requested operation cannot be performed on a volume for security reasons.
2. A required device is currently in use by the CE package.
3. No drive is available with a compatible access mode.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

CBR3378I Command failed due to the data areas in the controller having been destroyed in library *library-name*.

Explanation: Too much time has expired or too much activity has occurred in library *library-name* and the data areas used by the 3995 controller have been destroyed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

CBR3379I Volume mounted on drive *drive-name* is unformatted.

Explanation: A cartridge that is unformatted has been inserted into drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is halted until the volume is successfully formatted.

Operator Response: Follow the instructions for labelling a volume.

CBR3380I Command rejected, data length in the command packet is invalid.

Explanation: The data length passed to the controller in the command packet is not valid.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: See messages CBR3300I and CBR3301I which were issued prior to this message for the command packet information.

CBR3381I Volume mounted on drive *drive-name* contains an unrecognized format.

Explanation: A cartridge, that appears to be formatted, has been inserted into drive *drive-name* but the format is unrecognized by the controller.

Source: Object access method (OAM)

System Action: If the cartridge was entered into a library, the opportunity to format the cartridge is given. Choosing to cancel the format will result in the cartridge being ejected. If, however, the cartridge was mounted on an operator accessible drive, the cartridge will be demounted.

CBR3382I Solenoid failure in drive *drive-name*.

Explanation: Possibly due to a solenoid failure, drive *drive-name* will not accept or release a cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3383I Command rejected, general logic failure.

Explanation: The controller has detected a System Logic Error or a System Resource Error that it could not recover from.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3384I Command rejected, drive *drive-name* in use.

Explanation: This is a microcode programming error. A command was issued to drive *drive-name* when it was in use by another process.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR3385I Command rejected, all drives in library *library-name* are currently in use.

Explanation: The command issued to library *library-name* was rejected because all drives are currently in use.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR3386I Unable to gain proper control of the motors in library *library-name*.

Explanation: Unable to gain proper control of the motors in library *library-name*. When this error occurs, it has already been confirmed that the motors and encoders are functional. But the servo control system in library *library-name* is unable to initiate proper control.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3387I Unable to move the picker motor in library *library-name*.

Explanation: The picker motor in library *library-name* will not move.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3388I Unable to move the carriage motor in library *library-name*.

Explanation: The carriage motor in library *library-name* will not move.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3389I Unable to move either motor in library *library-name*.

Explanation: The picker and carriage motors in library *library-name* will not move.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3390I Unable to find hard stop while turning picker motor in library *library-name*.

Explanation: The picker motor in library *library-name* continues to spin longer than the maximum expected distance. Not able to find a hard stop.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3391I Unable to find hard stop while turning carriage motor in library *library-name*.

Explanation: The carriage motor in library *library-name* continues to spin longer than the maximum expected distance. Not able to find a hard stop.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3392I Excessive force required to move the carriage motor in library *library-name*.

Explanation: The carriage lead screw is binding in library *library-name* because it requires more force than normal to move it.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3393I Illegal test parameter was issued in library *library-name*.

Explanation: This is a microcode programming error. An illegal test parameter was issued in library *library-name*. Loop count parameter of zero (continuous running) was issued with the diagnostic command. There is no way to stop the repeating of test from the SCSI bus; therefore, the continuous count option is not valid.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3394I Invalid diagnostic test number sent to library *library-name*.

Explanation: This is a microcode programming error. An incorrect diagnostic test number was sent to library *library-name* by the 3995 controller. The 3995 controller issued a Send Diagnostic command to library *library-name* with a diagnostic number that is not supported by the library.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3395I Diagnostic failure in library *library-name*.

Explanation: The test specified in the previous Send Diagnostic command sent by the 3995 controller to library *library-name* failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3396I Parameter list length error in library *library-name* controller code.

Explanation: This is a microcode programming error. A command with data out as a parameter, has been received with incorrect parameter list length in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3397I Command operation code invalid for library *library-name*.

Explanation: This is a microcode programming error. A SCSI command that is not supported has been received by library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3398I Transport element address does not exist for library *library-name*.

Explanation: This is a microcode programming error. A SCSI command has been received that specifies a transport element address that does not exist in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3399I Source element address does not exist in library *library-name*.

Explanation: This is a microcode programming error. A SCSI command has been received that specifies a source element address that does not exist in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3400I Destination element address in library *library-name* does not exist.

Explanation: This is a microcode programming error. A SCSI command has been received that specifies the use of a destination element address that does not exist in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3401I Second destination element address specified for exchange command does not exist for library *library-name*.

Explanation: This is a microcode programming error. A SCSI command has been received that specifies a second destination element address that does not exist in library *library-name* for an exchange command.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3402I Illegal function specified for device type in library *library-name*.

Explanation: This is a microcode programming error. The command issued with the current parameters cannot be performed by library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3403I Command issued in library *library-name* contained invalid fields in the command descriptor block.

Explanation: This is a microcode programming error. A SCSI command issued in library *library-name* was received with one or more incorrect bits in the command descriptor block.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3404I A command was issued to library *library-name* that contained an unsupported logical unit number.

Explanation: This is a microcode programming error. A SCSI command was received by library *library-name* which contained an unsupported logical unit number.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3405I A command was issued to library *library-name* which contained an invalid field in the parameter list.

Explanation: This is a microcode programming error. A command, with incorrect data and data out as a parameter, has been received by library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3406I The carriage and picker assembly in library *library-name* has a cartridge in the picker.

Explanation: The carriage and picker assembly in library *library-name* received a move request, but has already has a cartridge in the picker.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3407I The destination storage element in library *library-name* already has a cartridge in it.

Explanation: A command was issued to store a cartridge in a destination storage element in library *library-name* that the 3995 library configuration table shows as already having media present.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: The 3995 library and OAM configuration tables are corrupted. A remap is recommended to correct the discrepancy.

CBR3408I The second destination element in library *library-name* already has a cartridge in it.

Explanation: A command was issued to store a cartridge in a second destination element in library *library-name* that the 3995 library configuration table shows as already having media present.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: The 3995 library and OAM configuration tables are corrupted. A remap is recommended to correct the discrepancy.

CBR3409I Source storage element in library *library-name* is empty.

Explanation: The source storage element in library *library-name* specified to be used for the operation does not have a cartridge in it.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: The 3995 library and OAM configuration tables are corrupted. A remap is recommended to correct the discrepancy.

CBR3410I First destination storage element in library *library-name* is empty.

Explanation: The first destination storage element in library *library-name* was specified to be used for an operation, but does not contain a cartridge.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: The 3995 library and OAM configuration tables are corrupted. A remap is recommended to correct the discrepancy.

CBR3411I A command issued in library *library-name* contains invalid bits in the identify message.

Explanation: This is a microcode programming error. A reserved bit has been set in the identify message in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix

for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3412I Could not clear the unit attention from a power on or a SCSI reset in library *library-name***.**

Explanation: Either library *library-name* has just powered up, or it has received a SCSI reset or SCSI bus device reset message and could not clear the unit attention.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3413I Command overlap in library *library-name***.**

Explanation: This is a microcode programming error. A second command has been received from the initiator while library *library-name* was disconnected and operating on the first command from the initiator.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3414I Message parity error in library *library-name***.**

Explanation: Library *library-name* received a message parity error from the initiator.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3415I Initiator select/reselect failure in library *library-name***.**

Explanation: Library *library-name* attempted to select/reselect the initiator unsuccessfully.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3416I SCSI parity error in library *library-name***.**

Explanation: A parity error occurred on the SCSI bus in library *library-name* during an information transfer out.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3417I Initiator detected error message in library *library-name***.**

Explanation: Library *library-name* received the initiator detected error message from the initiator.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3418I Error with no additional sense information for drive *drive-name***.**

Explanation: An error occurred on drive *drive-name*, but no sense information describing the error is available.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3419I No ESDI command complete from drive *drive-name***.**

Explanation: An extended system data interface (ESDI) command complete was not returned from drive *drive-name*. The drive controller microcode timed out waiting for a response to the last command.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3420I Write fault occurred on drive *drive-name***.**

Explanation: Write command failed on drive *drive-name.*

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message

CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3421I Drive *drive-name* **responded to the same drive number as another drive.**

Explanation: Multiple drives responded for the same drive number as drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3422I Logical unit communications failure between drive *drive-name* **and the drive controller.**

Explanation: An error was detected during the communications between drive *drive-name* and the drive controller unit.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3423I Track following error on drive *drive-name***.**

Explanation: A track following error occurs when the optical head for drive *drive-name* cannot stay on the same track.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3424I Load/unload failure on drive *drive-name***.**

Explanation: A failure was detected when loading or unloading the cartridge on drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. The drive is marked non-operational.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3425I Spindle failure on drive *drive-name***.**

Explanation: The spindle servo on drive *drive-name* was not locked with the reference signal and the optical disk was not rotated correctly.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3429I ID CRC error detected on drive *drive-name***.**

Explanation: The drive controller detected an error in the ID cyclic check redundancy code transferred from drive *drive-name*.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3430I Seek position error detected on drive *drive-name*.

Explanation: The seek to a specific track failed after retries to drive *drive-name*.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3431I Power-on diagnostic failure detected on drive *drive-name*.

Explanation: Power-on diagnostics have failed on drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3432I Message reject error from drive *drive-name*.

Explanation: The command sent to drive *drive-name* was rejected because the Message Reject message was sent by the initiator.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3433I Internal controller error detected in drive *drive-name*.

Explanation: The controller detected an error related to the drive controller hardware or microcode in drive *drive-name*.

Source: Object access method (OAM)

System Action: Either the drive or the volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3434I SCSI interface parity error detected on drive *drive-name*.

Explanation: The command was rejected because of an unrecovered parity error on the SCSI bus for drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3435I Initiator detected error for drive *drive-name*.

Explanation: The command was rejected because the Initiator Detected Error message (an unrecovered parity error on the SCSI bus for drive *drive-name*) was sent by the initiator.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3441I Drive *drive-name* could not become ready.

Explanation: The ready signal was negated on drive *drive-name*. The media in the drive is not spun up and the focus or slide servo was unlocked.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure. In addition, an attempt to recover the previously failed drive will be made if no operator action has occurred on that drive since the initial failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3442I Drive *drive-name* **is not selected.**

Explanation: Drive *drive-name* is not selected.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3443I No optical disk present in drive *drive-name***.**

Explanation: No optical disk is present in drive *drive-name*, even though the Autochange Element Status Table and the OAM configuration agree that one should be present.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer. Contact hardware support.

System Programmer Response: The 3995 Library and OAM configuration tables are corrupted. A remap is recommended to correct the discrepancy. Obtain the logrec error record.

CBR3444I Unrecoverable read error on drive *drive-name***.**

Explanation: The block(s) of data requested to be read, contain errors which could not be corrected, either by retries or by Error Correction Code (ECC).

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3446I Media in drive *drive-name* **has corrupted format.**

Explanation: The format information on the media in drive *drive-name* is incorrect. This can be caused by bad media or a mismatch between the current mode sense format and that retrieved from the optical disk.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

The volume could have caused the error if the media is not compatible with the drive; i.e., double capacity media mounted in a single capacity drive. Media that is contaminated and needs to be cleaned could also have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

Note: This error may occur during cartridge entry if the cartridge is new and the write protect tabs are in the data protect position. If this is the case, reset the write protect tabs and reinsert the cartridge.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3447I No spare sectors available on media mounted on drive *drive-name***.**

Explanation: There are no spare sectors available for the media mounted on drive *drive-name*.

Source: Object access method (OAM)

System Action: Volume is marked full and another volume is requested.

CBR3450I Invalid command operation code sent to drive *drive-name***.**

Explanation: This is a microcode programming error. The command code specified in the Command Descriptor Block sent to drive *drive-name* is incorrect or not implemented.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If

the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3451I Illegal block address specified in command to drive *drive-name*.

Explanation: This is a microcode programming error, or the media is corrupted. The logical block address in the command sent to drive *drive-name* is outside the area valid for the current media.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. OAM will mark the volume as non-writeable.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3452I Illegal function specified for media type mounted in drive *drive-name*.

Explanation: The format parameter in the command sent to drive *drive-name* is incorrect for the media type mounted.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. The drive is marked non-operational.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact hardware support. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3453I Illegal field in command descriptor block sent to drive *drive-name*.

Explanation: This is a microcode programming error. One of the fields in the command descriptor block sent to drive *drive-name* is incorrect.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3454I Invalid logical unit number sent to drive *drive-name*.

Explanation: This is a microcode programming error. Logical unit number (LUN) 2 through 7 is specified or the specified LUN does not respond to the selection from the controller unit in drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3455I Invalid field in parameter list for command sent to drive *drive-name*.

Explanation: This is a microcode programming error. One of fields in the parameter list sent to drive *drive-name* is invalid.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3456I A write protect indication for volume *volser* was received from drive *drive-name*.

Explanation: An erase or write request to volume *volser* mounted on drive *drive-name* was rejected because the drive indicated the volume may be write protected.

Source: Object Access Method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the previous drive will be marked operational and message CBR3304I will be issued identifying the volume as the cause of failure.

Operator Response: If the drive becomes not operational, vary the drive back online. Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

CBR3457I Could not clear unit attention from media change on drive *drive-name*.

Explanation: The media mounted on drive *drive-name* has been changed since the last command was issued and the unit attention could not be cleared.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3458I Could not clear unit attention from power on or device reset on drive *drive-name*.

Explanation: A SCSI reset condition has occurred on drive *drive-name*. Due to a drive power cycle, a SCSI reset, or a Device Bus Reset message sent to the drive and the unit attention could not be reset.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3459I Could not clear unit attention from mode select parameter being changed on drive *drive-name*.

Explanation: The mode select parameter has been changed since the last command was sent to drive *drive-name* and the unit attention could not be cleared.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3460I Command rejected, invalid suborder detected in command packet.

Explanation: The device controller has determined that the command packet contained an invalid suborder.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3461I Command rejected, command packet contains an invalid or missing entry in field VOLSER-1.

Explanation: The device controller has determined that the command packet contains an invalid or missing entry in field VOLSER-1.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3462I Command rejected, command packet contains an invalid or missing entry in field VOLSER-2.

Explanation: The device controller has determined that the command packet contains an invalid or missing entry in field VOLSER-2.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3463I Command rejected, missing or invalid category detected in command packet.

Explanation: The device controller has determined that the command packet contained an invalid or missing category.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3464I Command rejected, invalid packet id detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid packet id.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3465I Command rejected, invalid library id detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid library id.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3466I Command rejected, invalid drive id detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid drive id.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3467I Command rejected, invalid collection name detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid collection name.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3468I Command rejected, invalid object name detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid object name.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3469I Command rejected, invalid file handle detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid file handle.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3470I Command rejected, invalid object length detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid object length.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3471I Command rejected, invalid object offset detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid object offset.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3472I Command reject, invalid object security classification detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid object security classification.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3473I Command rejected, command packet contains an invalid or missing entry in field VOLSER-3.

Explanation: The device controller has determined that the command packet contains an invalid or missing entry in the field VOLSER-3.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR 3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3474I Command rejected, command packet contains an invalid or missing entry in field VOLSER-4.

Explanation: The device controller has determined that the command packet contains an invalid or missing entry in the field VOLSER-4.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300II and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3475I Command rejected, invalid mode detected in the command packet.

Explanation: The device controller has determined that the command packet contained an invalid mode.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300II and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3476I Command rejected, library *library-name* **locked.**

Explanation: The last command could not be completed because the library *library-name*, to which the command was issued, is locked.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: The CE has the library locked in order to perform maintenance on the library. Contact the CE for further information concerning the condition of the library.

CBR3477I Command rejected, command packet contains an invalid model number.

Explanation: The device controller has determined that the command packet contained all zeros of a model number.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300II and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3478I The state of the media mounted in drive *drive-name* **cannot be determined.**

Explanation: The state of the media in drive *drive-name* cannot be determined or has become unreliable.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Eject the cartridge and examine for damage.

CBR3479I Functional microcode in {library|drive} *library-name|drive-name* **has failed.**

Explanation: Functional microcode in {library|drive} *library-name/drive-name* has failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped and {library|drive} is marked non-operational.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous message CBR3300I does not equal zero then obtain the SYS1.LOGREC error record.

CBR3480I The input/output station in library *library-name* **is empty.**

Explanation: The 3995 controller has the status of the I/O station in library *library-name* as empty and cannot complete the last command.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

CBR3481I Volume *volser* **is not in library** *library-name***.**

Explanation: The 3995 controller for library *library-name* can not find volume *volser* in its configuration tables.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: The 3995 library and OAM optical configuration tables are corrupted. A remap is recommended to correct the discrepancy.

CBR3482I Library *library-name* **is full.**

Explanation: Library *library-name* has no more empty slots to allow cartridge entry.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: It is necessary to eject cartridges no longer needed from the library to allow cartridge entry.

CBR3483I Command rejected, remap in progress in library *library-name*.

Explanation: A remap is in progress in library *library-name*. No external commands to the library are allowed in the library until completion of the remap.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

CBR3484I Duplicate object name found on volume *volser* in library *library-name*.

Explanation: A duplicate object name found on volume *volser* in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

CBR3485I SCSI controller chip RAM failed in library *library-name*.

Explanation: An error was detected with the SCSI controller chip's RAM in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3486I Motor control chip RAM failed in library *library-name*.

Explanation: The motor control chip's RAM in library *library-name* has failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3487I The rear input/output station sensor in the input/output station in library *library-name* has failed.

Explanation: The rear input/output station sensor that detects when a cartridge has been inserted or removed from the input/output station in library *library-name* has failed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3488I Illegal test issued in library *library-name*. A front panel or RS232 panel is required.

Explanation: This is a microcode programming error. A test was issued in library *library-name* that requires a front panel or RS232 panel to run.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3489I Illegal test issued in library *library-name*. A SCSI interface is required.

Explanation: This is a microcode programming error. A test was issued in library *library-name* that requires the use of a SCSI interface.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3490I Unable to read from volume *volser* mounted on drive *drive-name* at this time.

Explanation: The read attempted from volume *volser* mounted on drive *drive-name* was rejected. At the time the read occurred, the medium or the extent of the medium was reserved by another initiator. A return code of 545 and a fault symptom code of X'0402' were received as a result of the I/O operation failure.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

CBR3491I No track zero found on drive *drive-name*.

Explanation: The rezero operation did not complete normally on drive *drive-name*.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3492I Incompatible media mounted on drive *drive-name***.**

Explanation: The media mounted on drive *drive-name* is not a compatible media for this drive.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Eject cartridge.

CBR3493I Drive *drive-name* **encountered an unrecoverable error.**

Explanation: An unrecoverable error occurred on drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. The drive is marked not operational.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous message CBR3300I does not equal zero then obtain the SYS1.LOGREC error record.

CBR3494I Overwrite error occurred on volume *volume-name* **mounted on drive** *drive-name*

Explanation: A previously recorded area was written over when writing data on volume *volume-name* mounted on drive *drive-name*. Any further writes could damage existing data on the volume. A return code of 550 and a fault symptom code of X'0401' or X'0701' were received as a result of the I/O operation failure.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. Volume *volume-name* will be marked unwriteable to prevent further writes from occurring on this volume.

Operator Response: None.

CBR3495I A blank sector was read from the volume mounted on drive *drive-name***.**

Explanation: An unrecorded sector was read from the volume mounted on drive *drive-name*.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3496I A write operation occurred on a recorded sector on volume *volser* **mounted on drive** *drive-name***.**

Explanation: This is a microcode programming error. A write operation to a recorded sector occurred on volume *volser* mounted on drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3497I Drive *drive-name* **encountered a status error from a second party on a copy command.**

Explanation: This is a microcode programming error. An error was detected by drive *drive-name* during a copy command.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3498E Door in library *library-name* **is open.**

Explanation: The interlock switch in library *library-name* is open.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Close the library door, then vary all the drives associated with the library, which will take about 5 minutes. After this is complete, vary the library.

CBR3499I Read element status address does not exist in library *library-name***.**

Explanation: This is a microcode programming error. A read element status command has been received that specifies the use of an element address that does not exist.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3500I OS/2 error, return code = *return-code*.

Explanation: An OS/2 return code, *return-code*, was received while processing the request.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: For a description of the error return code *return-code* see *OS/2 Programming Tools and Information*. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3501I Volume *volser* was mounted in library *library-name*, but was not the volume expected.

Explanation: As a result of a mount request, volume *volser* was mounted, but was not the original volume requested.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer. Contact hardware support.

System Programmer Response: The 3995 library and OAM optical configuration tables are corrupted. A remap is recommended to correct the discrepancy. C If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3502I Command rejected, a request for a volume or drive in library *library-name* is in use by another process.

Explanation: A volume or drive in library *library-name* is being exclusively used by another process at the time another request is received by the library controller.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: OAM should not be sending more than one request to a volume or drive at any time. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3503I Volume *volser* in drive *drive-name* is full.

Explanation: While in the process of writing to volume *volser* in drive *drive-name*, the volume became full. A return code of 2512 was received as a result of the I/O operation failure.

Source: Object access method (OAM)

System Action: The volume is marked full. The write request will be retried on another volume.

CBR3504I The cartridge was returned to the drive.

Explanation: During a demount, the slot would not accept the cartridge, and the cartridge was returned to the drive. See the explanation for message CBR3373I, which was issued prior to this message, for a more detailed description of the error.

Source: Object access method (OAM)

System Action: None.

Operator Response: The cartridge will be ejected for inspection. Contact hardware support.

System Programmer Response: Obtain the SYS1.LOGREC error record.

CBR3505I The cartridge remains in the picker.

Explanation: During a demount, the slot would not accept the cartridge and an attempt was made to return the cartridge to the drive. The library was unable to do so and the cartridge remains in the picker. See the explanation for message CBR3373I, which was issued prior to this message, for a more detailed description of the error.

Source: Object access method (OAM)

System Action: None.

Operator Response: Contact hardware support.

System Programmer Response: Obtain the SYS1.LOGREC error record.

CBR3506I The cartridge remains in a slot.

Explanation: During a mount, a slot would not release the cartridge, and the cartridge remains in the slot. See the explanation for message CBR3373I for a more detailed explanation of the error.

Source: Object access method (OAM)

System Action: The cartridge is flagged as stuck in a slot.

Operator Response: Contact hardware support.

System Programmer Response: Obtain the SYS1.LOGREC error record.

CBR3507I Unexpected error reported by drive *drive-name*.

Explanation: An error was received by drive *drive-name* which is unknown to the drive.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3508I Error condition reported by library *library-name*.

Explanation: An error was encountered by library *library-name*.

Source: Object access method (OAM)

System Action: The library is marked non-operational.

Operator Response: Vary the library offline then online again. Contact hardware support if the problem persists.

System Programmer Response: If the sense data displayed in the previous message CBR3300I does not equal zero then obtain the SYS1.LOGREC error record.

CBR3509I Command rejected, device driver timeout error.

Explanation: The device driver timed out while waiting for an operation to complete.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. If the return code was 700, the component which timed out was the autochanger SCSI; therefore, the library is marked non-operational. If the return code was 704, the component which timed out was the optical drive; therefore, the drive is marked non-operational.

Operator Response: Contact hardware technical support to correct the failing device.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3510I Command rejected, SCSI adapter card error.

Explanation: The SCSI adapter card encountered a failure while processing a request.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3511I Command rejected, non-critical resource error.

Explanation: This is a microcode programming error. The 3995 controller detected a non-critical resource error.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3512I Command rejected, controller logic error.

Explanation: This is a microcode programming error. The 3995 controller detected a logic error while processing the request.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3513I Illegal function specified for drive *drive-name***.**

Explanation: This is a microcode programming error. The function specified for drive *drive-name* is illegal. were received as a result of the I/O operation failure.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3514I Compare error detected during processing on drive *drive-name***.**

Explanation: While processing a request, drive *drive-name* encountered a compare error.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3515I Command rejected, command packet contains an invalid entry in the field PACDATL.

Explanation: The device controller has determined that the command packet contained an invalid value in the field PACDATL.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3516I Command rejected, the number of open files has exceeded the allowed limits.

Explanation: Only 128 open files are allowed against a volume at any one time. The device controller has determined that the number of open files has exceeded the number of open files allowed.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3517I Command rejected, command packet contains an invalid serial number.

Explanation: The device controller has determined that the command packet contained all zeros of a serial number.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If

the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3518I The vendor product data file failed to open in library *library-name*.

Explanation: The vendor product data file failed to open or is contaminated in library *library-name*.

Source: Object access method (OAM)

System Action: None.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3519I Error reading label of volume mounted on drive *drive-name*.

Explanation: Unable to read the label of the volume mounted on drive *drive-name*.

Source: Object access method (OAM)

System Action: The volume is marked unreadable in the Volume Configuration Table. If both volumes on the cartridge are unreadable, then the cartridge is ejected from the library. If the volume on the other side can be read, the cartridge mounted on drive *drive-name* is demounted. Any data on the unreadable volume is no longer available until the label can be read.

Operator Response: Eject the volume, or, if the cartridge has already been ejected, inspect for physical damage.

Note: This error may occur during cartridge entry if the cartridge is new and the write protect tabs are in the data protect position. If this is the case, reset the write protect tabs and reinsert the cartridge.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3520I Command rejected, command packet contains an invalid open type.

Explanation: The device controller has determined that the command packet contained an invalid value for the open type.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

CBR3521I Command rejected, command packet contains an invalid PACLIBF.

Explanation: The device controller has determined that the command packet contained an invalid PACLIBF field. I/O operation failure.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

CBR3522I Command rejected, command packet contains an invalid PACDRVF.

Explanation: The device controller has determined that the command packet contained an invalid PACDRVF field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

CBR3523I Command rejected, command packet contains an invalid PACCMDBF1.

Explanation: The device controller has determined that the command packet contained an invalid PACCMDBF1 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

CBR3525I Decrease in reflection beam power detected on drive *drive-name*.

Explanation: Drive *drive-name* has detected a decrease in reflection beam power.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3526I A select/reselect failure occurred on drive *drive-name*.

Explanation: Drive *drive-name* encountered a select/reselect error.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3527I Command rejected, device driver/ABIOS/SCSI card microcode error.

Explanation: This is a microcode programming error. The SCSI card encountered a general microcode failure while processing a request.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3528I Command rejected, multiple unit attentions occurred.

Explanation: The controller received multiple unit attentions in response to a single request.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3529I Command rejected, command packet contains an invalid PACCMDBF2.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDBF2 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3530I Non-volatile RAM checksum failure in library *library-name***.**

Explanation: The non-volatile RAM checksum has failed in library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3531I Command rejected, SCSI adapter card error.

Explanation: The SCSI adapter card failed to respond to a request.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3532I Command rejected, bus protocol error.

Explanation: A bus protocol error was detected by the library controller.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3533I Command rejected, command packet contains an invalid PACCMDBF3.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDBF3 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3534I Command rejected, command packet contains an invalid PACCMDBF4.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDBF4 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3535I Command rejected, command packet contains an invalid PACCMDHW1.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDHW1 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3536I Command rejected, command packet contains an invalid PACCMDHW2.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDHW2 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3537I Command rejected, command packet contains an invalid PACCMDHW3.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDHW3 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3538I Command rejected, command packet contains an invalid PACCMDHW4.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDHW4 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3539I Command rejected, command packet contains an invalid PACCMDW1.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDW1 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3540I Command rejected, command packet contains an invalid PACCMDW2.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDW2 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3541I Command rejected, command packet contains an invalid PACCMDW3.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDW3 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3542I Command rejected, command packet contains an invalid PACCMDW4.

Explanation: The device controller has determined that the command packet contains an invalid PACCMDW4 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3543I Command rejected, command packet contains an invalid PACDATA1.

Explanation: The device controller has determined that the command packet contains an invalid PACDATA1 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3544I Command rejected, command packet contains an invalid PACDATA2.

Explanation: The device controller has determined that the command packet contains an invalid PACDATA2 field.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative. See messages CBR3300I and CBR3301I which were issued prior to this message for the packet information.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3545I Excessive cartridges detected in library *library-name***.**

Explanation: Excessive cartridges were detected in library library *library-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: None.

CBR3546I Calibration sensor not found in library *library-name***.**

Explanation: The picker in library *library-name* is unable to properly block the calibration sensor. This may be due to:

- The calibration sensor appearing to be blocked before the picker is in range to block the sensor.
- The sensor never becoming blocked because the picker is attempting calibration in the library which requires use of the calibration sensor.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: None.

CBR3547I Internal track error on drive *drive-name***.**

Explanation: An internal track error occurred on drive *drive-name*.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this previous request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3548I Unrecoverable read error of SSA on drive *drive-name***.**

Explanation: Drive *drive-name* could not read the SSA sector.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this previous request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3549I Invalid switch setting on drive *drive-name***.**

Explanation: Either SW6(SCSI reset switch) or SW7(auto spin up switch) in drive *drive-name* is on.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3550I Statistical Information Activated switch is on in drive *drive-name***.**

Explanation: Drive *drive-name* has the Statistical Information Activated switch on. It should be in the off position for 3995 drives.

Source: Object Access Method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3552I Media removal error detected on drive *drive-name*.

Explanation: The media removal command was sent to a LUN with the "disable medium removal" active on drive *drive-name*.

Source: Object Access Method (OAM)

System Action: The optical disk volume will remain on the drive. The I/O operation is stopped.

Operator Response: Notify the service representative.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3553I Inhibit media removal switch active on drive *drive-name*.

Explanation: The media removal command was sent to an LUN with the "inhibit media removal dip switch 2" active on drive *drive-name*.

Source: Object Access Method (OAM)

System Action: The optical disk volume will remain on the drive. The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3554I Peripheral device write fault on drive *drive-name*.

Explanation: A write fault error occurred on drive *drive-name* when a circuit fault was detected during a write operation, when the Tracking Error Signal exceeded the allowable range during a write or an erase, when a failure occurred during LASER write power calibration, or when a LASER over power check failed during a write calibration.

Source: Object Access Method (OAM)

System Action: Either the drive or the volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3555I No index/sector signal on drive *drive-name*.

Explanation: No sector mark was found on the media on drive *drive-name*.

Source: Object Access Method (OAM)

System Action: Either the drive or the volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3556I Reassignment process failed three times on drive *drive-name*.

Explanation: During the automatic reassignment process, the drive was unable to write the assigned alternate sector after attempting the process on three different spare sectors on drive *drive-name*.

Source: Object Access Method (OAM)

System Action: Either the drive or the volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3557I Data sync mark error on drive *drive-name*.

Explanation: A data synchronization error occurred when the sync field at the beginning of the data field could not be detected for drive *drive-name*.

Source: Object Access Method (OAM)

System Action: Either the drive or the volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3558I Invalid message error on drive *drive-name*.

Explanation: An inappropriate message occurred when the initiator sent a message that either is not supported or is not a logical sequence on drive *drive-name*.

Source: Object Access Method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3560I Drive *drive-name* not ready.

Explanation: Drive *drive-name* became not ready while format was in process.

Source: Object Access Method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3561I An erase failure occurred on drive *drive-name*.

Explanation: An erase operation was attempted on drive *drive-name*, but the erase check line was not active during that operation.

Source: Object Access Method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3562I A defect list error occurred on drive *drive-name*.

Explanation: Drive *drive-name* encountered an error updating some or all of the defect list tables.

Source: Object Access Method (OAM)

System Action: Either the drive or the volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3563I A diagnostic failure occurred on drive *drive-name*.

Explanation: Drive *drive-name* detected a failure while running the internal diagnostic test during idle time, cartridge insertion tests, or in response to a SEND DIAGNOSTIC command. The Unit Error Field in additional sense contains more information on the nature of the failure.

Source: Object Access Method (OAM)

System Action: Either the drive or the volume could have caused the failure.

The volume could have caused the error if the media is not compatible with the drive; i.e., double capacity media mounted in a single capacity drive.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3564I A medium load/unload failure occurred on drive *drive-name***.**

Explanation: Drive *drive-name* detected a failure to load or unload the media in response to a command.

Source: Object Access Method (OAM)

System Action: Either the drive or the volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3565I Saving parameters is not supported on drive *drive-name***.**

Explanation: Drive *drive-name* does not support the saving of parameters.

Source: Object Access Method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3566I A spindle servo error occurred on drive *drive-name***.**

Explanation: A spindle servo error was detected on drive *drive-name* on a spin up of the servo.

Source: Object Access Method (OAM)

System Action: Either the drive or the volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the drive will be internally varied online and message CBR3304I will be issued identifying the volume as the cause of failure.

Once the request is retried, the original failing drive will be brought back online by OAM. If the drive takes repeated similar errors, the drive will be taken permanently out of service and message CBR5513E will be issued.

Operator Response: Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3567I A spindle servo error occurred on drive *drive-name***.**

Explanation: A spindle servo error was detected on drive *drive-name* on a spin down of the servo motor.

Source: Object Access Method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3568I A data path parity error occurred on drive *drive-name***.**

Explanation: A drive error occurred when a parity error was detected by drive *drive-name*.

Source: Object Access Method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3569I Volume *volser* **is mounted in backup mode.**

Explanation: Volume *volser* had an error during its mount sequence that caused it to use its backup control blocks to successfully mount the media. This is an indication that either the media is becoming contaminated or the media is actually going bad.

Source: Object access method (OAM)

System Action: The I/O operation completed successfully.

Operator Response: Notify the system programmer.

System Programmer Response: The volume specified in this message should be restored to another volume.

CBR3570I Volume *volser* **has a corrupted volume directory.**

Explanation: The directory intent and update counters for volume *volser* are not equal. This means an error occurred while trying to update the volume directory. Errors may occur while trying to read from this volume.

Source: Object access method (OAM)

System Action: The I/O operation completed successfully.

Operator Response: Notify the system programmer.

System Programmer Response: The volume specified in this message should be restored to another volume.

CBR3571I Logical unit not ready, spindle motor turned off on drive *drive-name***.**

Explanation: The spindle motor has been turned off by the Start/Stop Unit command on drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3572I Microcode has been changed on drive *drive-name***.**

Explanation: In a multi-initiator system, another initiator has changed the microcode with a Write Buffer command on drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3573I Object *collection-name object-name* **not found on volume** *volser***.**

Explanation: A read request was issued for object *object-name* in collection *collection-name* on volume *volser* but the object was not found on that volume.

Source: Object access method (OAM)

System Action: The request is failed.

Operator Response: Verify that duplicate volumes do not exist.

System Programmer Response: Check the object directory entry and attempt a retrieve of the object using a backup copy, if one exists. Check the object directory for other objects on that volume to verify that they are not missing. Contact hardware support to check the optical media.

CBR3574I Collection name *collection-name* **not found on volume** *volser* **while attempting to read object** *object-name***.**

Explanation: A read request was issued for object *object-name* in collection *collection-name* on volume *volser* but the collection name was not found on that volume.

Source: Object access method (OAM)

System Action: The request is failed.

Operator Response: Verify that duplicate volumes do not exist.

System Programmer Response: Check the object directory entry and attempt a retrieve of the object using a backup copy, if one exists. Check the object directory for other objects on that volume to verify that they are not missing. Contact hardware support to check the optical media.

CBR3575I Parameter list length error for command on drive *drive-name***.**

Explanation: This is a microcode programming error. The command issued to drive *drive-name* does not have the same amount of parameters as the drive expects.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. The drive is marked not operational.

Operator Response: Notify the service representative.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the SYS1.LOGREC error record.

CBR3576I Initiator sent a second command to drive *drive-name* **while busy with previous command.**

Explanation: This is a microcode programming error. The library issued a command to an already busy drive *drive-name*.

Source: Object access method (OAM)

System Action: The I/O operation is stopped. The drive is marked not operational.

Operator Response: Notify the service representative.

System Programmer Response: Contact service to diagnose drive.

CBR3577I Library *library-name* **is currently busy in diagnostic mode.**

Explanation: The library *library-name* is in Diagnostics Mode. While in this Mode, the library blocks any commands from the Host.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Reset the library out of diagnostic mode and retry the command. If the problem recurs, contact hardware support.

System Programmer Response: If the sense data displayed in the previous message CBR3300I does not equal zero then obtain the SYS1.LOGREC error record.

CBR3578I One of the fans in library *library-name* **has failed.**

Explanation: The sensor of the fan in library *library-name* detected that the fan is not functional.

Source: Object access method (OAM)

System Action: The I/O operation continues.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous message CBR3300I does not equal zero then obtain the SYS1.LOGREC error record.

CBR3579I Library *library-name* **configuration is corrupted. A remap is recommended.**

Explanation: The configuration table for library *library-name* is corrupted. The picker has discovered that an optical cartridge is not in its assigned location.

Source: Object access method (OAM)

System Action: The library is marked not operational.

Operator Response: Notify the system programmer.

System Programmer Response: The 3995 library configuration table is corrupted. A remap is recommended to correct the discrepancy. If the sense data displayed in the previous message CBR3300I does not equal zero then obtain the SYS1.LOGREC error record.

CBR3580I The volume mounted on drive *drive-name* has a problem.

Explanation: Volume *volser* mounted on drive *drive-name* may be contaminated. The surface of the media could be dirty or damaged, which may require cleaning before further use.

Source: Object access method (OAM)

System Action: Either the drive or volume could have caused the failure.

If the volume has not failed a previous request on another drive, the drive will be marked not operational and the volume flagged as having failed this request. The volume will then be mounted on another drive and the request retried.

If, however, the volume has failed a previous request on another drive, the previous drive will be marked operational and message CBR3304I will be issued identifying the volume as the cause of failure.

Operator Response: If the drive becomes not operational, vary the drive back online. Contact hardware support if the drive continues to become not operational.

If the volume has been identified as the cause of error, see message CBR3304I in this manual and follow the instructions listed.

CBR3581I The volume mounted in the operator accessible drive *drive-name* was ejected.

Explanation: The operator pressed the media eject button on the operator accessible drive to eject the volume. The media was ejected.

Source: Object access method (OAM)

System Action: The I/O operation is stopped.

Operator Response: Re-enter the volume into an appropriate operator accessible drive and retry.

CBR3582I Temperature alarm in library *library-name*.

Explanation: Internal temperature of library *library-name* exceeded the maximum limit.

Source: Object access method (OAM)

System Action: The library is marked non-operational.

Operator Response: Contact hardware support.

System Programmer Response: If the sense data displayed in the previous message CBR3300I does not equal zero then obtain the SYS1.LOGREC error record.

CBR3583I Volume *volser* mounted on drive *drive-name* is write protected.

Explanation: Erasing or writing to volume *volser* mounted on drive *drive-name* was rejected because the write protect switch on the cartridge is on.

Source: Object Access Method (OAM)

System Action: Volume *volser* mounted on drive *drive-name* will be marked write protected.

If the request for the volume was non-specific then the command will be reissued requesting a different volume.

System Programmer Response: None.

CBR3584I Format of media mounted on drive *drive-name* failed.

Explanation: A volume format on drive *drive-name* was interrupted either by a drive error or by another process before completion.

Source: Object Access Method (OAM)

System Action: The cartridge is ejected if internally located, or demounted if drive is an operator accessible drive.

Operator Response: Retry the failing function or command with the existing cartridge. If the problem still exists, contact hardware support for possible microcode or OS/2 problem.

Application Programmer Response: If the sense data displayed in the previous CBR3300I message does not equal zero then obtain the Sys1.LOGREC error record.

CBR3585I Insertion of media into the I/O station has caused the remap for library *library-name*. to suspend.

Explanation: The picker attempted to use the I/O station as a temporary slot during the remap of library *library-name*, but was unable to, because there was already a cartridge in the I/O station.

Source: Object access method (OAM)

System Action: A message is issued asking the operator to remove the cartridge from the I/O station. Processing for the library will remain suspended until the cartridge is removed or the I/O operation times out. If the cartridge is removed, the remap for the library will continue. If the I/O operation times out, the REMAP request will be failed.

Operator Response: Remove the cartridge from the library's I/O station.

CBR3590I Invalid drive ID *drive-id* returned from library *library-name* in command packet response.

Explanation: Library *library-name* returned with a successful completion for a mount, demount, or audit command. However, the drive ID *drive-id* in the command packet response was invalid and OAM does not know what drive the requested optical volume was mounted on.

Source: Object access method (OAM)

System Action: The library is marked non-operational and a symptom string record is written to the error recording data set (SYS1.LOGREC).

Operator Response: Contact IBM hardware service and support.

System Programmer Response: Use EREP to print the symptom string records in SYS1.LOGREC prior to contacting IBM hardware service and support.

CBR3600I Unable to eject volume *volser* from library *library-name* following volume entry failure.

Explanation: Volume *volser* could not be ejected from library *library-name*. See the secondary error message for a description of the failure.

Source: Object Access Method (OAM)

System Action: The volume remains in the insert category and is processed as part of the next enter request. Depending on the failure, cartridge entry processing in this library may be suspended. If processing is suspended, message CBR3618I is issued in conjunction with this message; cartridge entry processing will resume when more cartridges have been entered into the library, when OAM has been stopped and restarted, or when the LIBRARY RESET

command has been issued. A secondary error message is also issued to provide more detailed information about the cause of the error.

System Programmer Response: Refer to the secondary error message.

CBR3601I Entry of volume *volser* into library *library-name1* rejected. Duplicate in library *library-name2*.

Explanation: Volume *volser* could not be successfully entered into library *library-name1*. There is already a volume record in the tape configuration database for this volume indicating that it is in library *library-name2*.

Source: Object Access Method (OAM)

System Action: The volume is scheduled for ejection.

System Programmer Response: Determine if the volume is in library *library-name2* (an audit of this volume may be necessary or try entering the cartridge into *library-name2*). If it is, duplicate volsers are not allowed. If it is not, the volume record pertaining to this volume can be updated using IDCAMS to indicate *library-name1* or deleted entirely so that the cartridge can be entered into this library.

CBR3602I Enter request rejected by the cartridge entry installation exit (CBRUXENT).

Explanation: The cartridge entry installation exit (CBRUXENT) did not allow the cartridge to be entered into the library. Refer to preceding message CBR3620I for the volume serial number and library name associated with the enter request.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM schedules the volume to be ejected. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, entry processing continues with the next volume.

CBR3603I Entry of volume *volser* into library *library-name* rejected. Duplicate {DASD | optical} volume exists.

Explanation: Volume *volser* could not be entered into library *library-name*. There is already an SMS DASD pool volume or an OAM optical volume with this volser.

Source: Object Access Method (OAM)

System Action: The volume is scheduled for ejection.

Operator Response: Change the external volser for this cartridge.

CBR3604I Unable to update scratch volume or empty slot count for library *library-name*.

Explanation: Upon completion of cartridge entry, cartridge ejection, or library vary online processing, the library record in the tape configuration database for library *library-name* could not be updated with the correct number of scratch volumes or empty slots. Check for a preceding IDC3009I message for a possible integrated catalog facility (ICF) failure.

Source: Object Access Method (OAM)

System Programmer Response: Use the diagnostic information in IDC3009I to determine the cause of failure.

CBR3605I Entry of volume *volser* into library *library-name* rejected. Storage group *storage-group-name* invalid.

Explanation: Volume *volser* could not be entered into library *library-name*. The storage group name in the tape volume record in the tape configuration database is invalid for one of the following reasons:

1. The storage group is not defined in the active SMS configuration.
2. The storage group is not a tape storage group.
3. The library into which the volume is being entered is not defined to the storage group.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM schedules the volume to be ejected. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, entry processing continues with the next volume.

System Programmer Response: Enter the volume into a library which is defined to the storage group, or change the storage group name in the tape volume record using one of the following methods:

1. IDCAMS ALTER VOLUMEENTRY.
2. The volume alter facility of the ISMF mountable tape volume list application.
3. The cartridge entry installation exit CBRUXENT.

CBR3606I Entry of volume *volser* into library *library-name* failed. Unable to set the volume category.

Explanation: Volume *volser* could not be entered into library *library-name*. The volume category could not be set. See the secondary error message for a description of the failure.

Source: Object Access Method (OAM)

System Action: The volume remains in the insert category and is processed as part of the next enter request. Cartridge entry processing in this library is suspended until more cartridges have been entered into the library or until OAM has been stopped and restarted. The LIBRARY RESET command may be used to resume cartridge entry processing.

System Programmer Response: Refer to the secondary error message.

CBR3607I Abend *ABEND-code* occurred in the cartridge entry installation exit (CBRUXENT).

Explanation: The enter request has failed due to the cartridge entry installation exit (CBRUXENT) abending. Refer to preceding message CBR3620I for the volume serial number and library name of the enter request.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM leaves the volume it was processing in the insert category. A dump is written to a SYS1.DUMP data set to aid the installation in debugging the problem. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, entry processing is discontinued until OAM has been stopped and restarted, or the LIBRARY RESET command has been issued to re-enable the cartridge entry installation exit (CBRUXENT).

System Programmer Response: Determine the cause of the cartridge entry installation exit (CBRUXENT) failure. LINKEDIT a new copy of the installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3608I Invalid return code *return-code* from the cartridge entry installation exit (CBRUXENT).

Explanation: The enter request has failed because an invalid return code *return-code* is returned from the cartridge entry installation exit (CBRUXENT). Refer to preceding message CBR3620I for the volume serial number and library name associated with the enter request.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM leaves the volume it was processing in the insert category. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, entry processing is discontinued until OAM has been stopped and restarted, or the LIBRARY RESET command has been issued to re-enable the cartridge entry installation exit (CBRUXENT).

System Programmer Response: Determine the cause of the cartridge entry installation exit (CBRUXENT) failure. LINKEDIT a new copy of the installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3609I Invalid data *data* returned from the installation exit (CBRUXENT) in field *field-name*.

Explanation: The enter request failed because invalid data was returned from the cartridge entry installation exit (CBRUXENT) in field *field-name* in the cartridge entry installation exit parameter list (CBRUXEPL). For a description of the fields and their valid values consult the cartridge entry installation exit parameter list (macro CBRUXEPL). Refer to succeeding message CBR3620I for the volume serial number and library name associated with the enter request.

Source: Object access method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM leaves the volume it was processing in the insert category. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, entry processing is discontinued until OAM has been stopped and restarted, or the LIBRARY RESET command has been issued to re-enable the cartridge entry installation exit (CBRUXENT).

System Programmer Response: Determine the cause of the cartridge entry installation exit (CBRUXENT) failure. LINKEDIT a new copy of the installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3610I Volume entry processing. The following volumes were entered into library *library-name*. *volser1 volser2 volser3 volser4 volser5 volser6 volser7 volser8*

Explanation: One or more volumes have been successfully entered into library *library_name*.

Source: Object Access Method (OAM)

System Action: The newly entered volumes are used by the system as needed.

CBR3613I Unable to obtain storage for the installation exit (CBRUXENT) parameter list.

Explanation: The enter request failed because storage for the cartridge entry installation exit (CBRUXENT) parameter list could not be obtained. Refer to preceding message CBR3620I for the volume serial number and library name associated with the enter request.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM leaves the volume it was processing in the insert category. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, cartridge entry processing in this library is suspended until more cartridges have been entered into the library or the programmed interface has been invoked. Also, for volumes that remain in the insert category, entry processing will automatically resume if OAM has been stopped and restarted, or if the LIBRARY RESET command is used.

System Programmer Response: Determine the cause of the storage shortage.

CBR3614I Unable to establish an ESTAE for the installation exit (CBRUXENT). ESTAE RC = *return-code*.

Explanation: The cartridge entry request failed because OAM was unable to establish a recovery environment for the cartridge entry installation exit (CBRUXENT). Refer to preceding message CBR3620I for the volume serial number and library name associated with the enter request.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM leaves the volume it was processing in the insert category. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, cartridge entry processing in this library is suspended until more cartridges have been entered into the library or the programmed interface has been invoked. Also, for volumes that remain in the insert category, entry processing will automatically resume if OAM has been stopped and restarted, or if the LIBRARY RESET command is used.

System Programmer Response: Determine the cause of the ESTAE failure. Return codes from the MVS ESTAE macro are documented in *OS/390 MVS Programming: Assembler Services Reference*.

CBR3615E Tape entry processing discontinued due to an installation exit (CBRUXENT) failure.

Explanation: During volume entry processing, the cartridge entry installation exit (CBRUXENT) has either

- Returned with invalid data
- Returned with an invalid return code or
- Abnormally ended.

A prior message has identified the specific cause of failure.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM leaves the volume it was processing in the insert category. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, entry processing is discontinued until OAM has been stopped and restarted, or the LIBRARY RESET

command has been issued to re-enable the cartridge entry installation exit (CBRUXENT).

System Programmer Response: Determine the cause of the cartridge entry installation exit (CBRUXENT) failure. LINKEDIT a new copy of the cartridge entry installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3616I Cartridge entry processing for library *library-name* **failed. Unable to obtain the insert category inventory.**

Explanation: During cartridge entry processing in library *library-name*, the insert category inventory could not be obtained. See the secondary error message for a description of the failure.

Source: Object Access Method (OAM)

System Action: The volumes remain in the insert category and are processed as part of the next enter request. Cartridge entry processing in this library is suspended until more cartridges have been entered into the library or until OAM has been stopped and restarted. The LIBRARY RESET command may be used to resume cartridge entry processing.

System Programmer Response: Refer to the secondary error message.

CBR3617I Unable to obtain the number of {scratch volumes | empty slots} in library *library-name***.**

Explanation: Upon completion of cartridge entry, cartridge ejection, or vary online processing in library *library-name*, either the number of scratch volumes or the number of empty slots could not be obtained. See the secondary error message for a description of the failure.

Source: Object Access Method (OAM)

System Action: The library record in the tape configuration database cannot be updated to reflect the true value.

System Programmer Response: Refer to the secondary error message.

CBR3618I Tape entry processing in library *library-name* **suspended.**

Explanation: During volume entry processing in library *library-name*, an error occurred causing processing to be suspended. A prior message identifies the specific cause of failure.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM leaves the volume it was processing in the insert category. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, cartridge entry processing in this library is suspended until more cartridges have been entered into the library or the programmed interface has been invoked. Also, for volumes that remain in the insert category, entry processing will automatically resume if OAM has been stopped and restarted, or if the LIBRARY RESET command is used.

System Programmer Response: Refer to the prior message for the cause of the failure.

CBR3619I Entry of volume *volser* **in library** *library-name* **failed. Unable to determine volser uniqueness.**

Explanation: Volume *volser* could not be entered into library *library-name*. OAM could not determine if the volume serial number is already defined, either as an SMS DASD pool volume or as an OAM optical volume.

Source: Object Access Method (OAM)

System Action: For optical volume processing, the volume is ejected. For tape library processing, the volume remains in the insert category.

Operator Response: Do not proceed to enter this volume until the problem has been resolved.

System Programmer Response: Refer to the symptom record in the logrec data set for the cause of the failure.

CBR3620I Entry of volume *volser* **into library** *library-name* **failed.**

Explanation: Volume *volser* could not be entered into library *library-name*. This message is issued in conjunction with message CBRxxxxI explaining the cause of the failure.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

Operator Response: Do not proceed with cartridge entry until the problem has been resolved.

System Programmer Response: Refer to the message that is issued in conjunction with this message for the cause of the entry failure.

CBR3621I Enter request ignored by the cartridge entry installation exit (CBRUXENT).

Explanation: The cartridge entry installation exit returned indicating that the entry request is to be ignored. Refer to preceding message CBR3620I for the volume serial number and library name associated with the enter request.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM leaves the volume it was processing in the insert category. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, cartridge entry processing continues with the next volume.

CBR3622I Entry of volume *volser* **into library** *library-name* **rejected. Media type inconsistency between the LM and the TCDB.**

Explanation: Volume *volser* could not be successfully entered into library *library-name*. There is already a volume record in the tape configuration database for this volume indicating that it is either shelf resident or resides in a library. The media type of the entered volume does not match the media type for the volume in the tape configuration database.

Source: Object Access Method (OAM)

System Action: The volume is scheduled for ejection.

System Programmer Response: Determine why the media type reported by the library manager is inconsistent with the media type for this volume in the tape configuration database. If the media type in the TDCB is incorrect, the volume record can be updated or deleted using IDCAMS. If the media type of the volume is reported

incorrectly, this must be corrected at the library manager before the volume can be reinserted back into the library. Possible causes of the inconsistency:

- The volume record in the TDCB was manually created or updated.
- A seventh character external media type label is missing or not positioned correctly.
- A default media type was assigned to this volume at the library manager and the default media type is incorrect for this volume.
- A media type volser range was established at the library manager that does not match the actual media type.
- There is a vision system problem that caused the media type to be incorrectly read.

Once the problem has been resolved, reenter the volume into the library.

CBR3623I Invalid tape storage group *storage-group-name* **returned from installation exit (CBRUXENT).**

Explanation: The enter request failed because an invalid tape storage group was explicitly set and returned from the cartridge entry installation exit (CBRUXENT) in field UXEGROUP in the cartridge entry installation exit parameter list (CBRUXEPL). The storage group returned from the installation exit is defined in the active SMS configuration as a valid tape storage group, however the library in which the volume was entered is not defined to that storage group. Refer to preceding message CBR3620I for the volume serial number and library name associated with the enter request.

Source: Object Access Method (OAM)

System Action: For cartridge entry processing into an automated tape library dataserver or for entry processing into a manual tape library dataserver that was initiated at the library manager console, OAM schedules the volume to be ejected. In all cases, including the programmed interface for cartridge entry into a manual tape library dataserver, entry processing continues with the next volume.

System Programmer Response: Enter the volume into a library which is defined to the storage group, or change the storage group associated with the volume in the tape management system database, or modify the cartridge entry installation exit to return a valid tape storage group for the library in which the volume was entered.

CBR3624I Entry of volume *volser* **into library** *library-name* **ignored. TDSI recording technology** *recording-technology* **not known.**

Explanation: An attempt has been made to enter volume *volser* with recording technology *recording-technology* into library *library-name*, however the recording technology returned by the cartridge entry installation exit (CBRUXENT) is not understood at this system level or the recording technology is invalid on any system level.

Source: Object Access Method (OAM)

System Action: OAM leaves the volume in the insert category to be processed by a system that understands the recording technology.

System Programmer Response: Verify the recording-technology returned by the cartridge entry installation exit is valid and that there is at least one system available that supports this recording technology.

CBR3640I Abend *ABEND-code* **occurred in the volume not in library installation exit (CBRUXVNL).**

Explanation: The volume not in library installation exit (CBRUXVNL) received control and abnormally terminated.

Source: Object Access Method (OAM)

System Action: A dump is written to a system dump data set (SYS1.DUMPxx) to aid in problem determination. The volume not in library installation exit (CBRUXVNL) is deactivated (meaning that it will not be invoked again until reactivated). Normal system processing continues without invoking the volume not in library installation exit until either OAM has been stopped and restarted, or the installation exit has been reactivated by issuing the LIBRARY RESET, CBRUXVNL command.

System Programmer Response: Perform the following steps:

- Determine the cause of the failure by analyzing the system dump using IPCS.
- Correct the source code in the volume not in library installation exit.
- Re-compile or assemble the volume not in library installation exit.
- Link a new version of the volume not in library installation exit into the program library containing the exit.
- If the program library containing the volume not in library installation exit, load module CBRUXVNL, is managed by the Library Lookaside Facility (LLA), then use the MVS operator MODIFY LLA command, in conjunction with a CSVLLAxx PARMLIB member, to refresh the CBRUXVNL load module being managed by the Library Lookaside Facility.
- Reactivate the volume not in library installation exit by either stopping and restarting the OAM address space or issuing a LIBRARY RESET, CBRUXVNL command at an MVS system console.

CBR3641I Invalid return code *return-code* **from the volume not in library installation exit (CBRUXVNL).**

Explanation: An invalid return code *return-code* was returned from the volume not in library installation exit (CBRUXVNL).

Source: Object Access Method (OAM)

System Action: The volume not in library installation exit (CBRUXVNL) is deactivated (meaning that it will not be invoked again until reactivated). Normal system processing continues without invoking the volume not in library installation exit until either OAM has been stopped and restarted, or the installation exit has been reactivated by issuing the LIBRARY RESET, CBRUXVNL command.

System Programmer Response: Perform the following steps:

- Determine the reason why the volume not in library installation exit returned an invalid return code.
- Correct the source code in the volume not in library installation exit.
- Re-compile or assemble the volume not in library installation exit.
- Link a new version of the volume not in library installation exit into the program library containing the exit
- If the program library containing the volume not in library installation exit, load module CBRUXVNL, is managed by the Library Lookaside Facility (LLA), then use the MVS operator MODIFY LLA command, in conjunction with a CSVLLAxx PARMLIB member, to refresh the CBRUXVNL load module being managed by the Library Lookaside Facility.

- Reactivate the volume not in library installation exit by either stopping and restarting the OAM address space or issuing a LIBRARY RESET, CBRUXVNL command at an MVS system console.

CBR3642I Unable to obtain storage for the volume not in library installation exit (CBRUXVNL) parameter list.

Explanation: The attempt to obtain storage for the parameter list (CBRUXNPL) to be passed to the volume not in library installation exit failed.

Source: Object Access Method (OAM)

System Action: The volume not in library installation exit is not invoked and OAM processing continues as if the exit returned with a return code of zero indicating OAM is to perform normal processing for this error situation.

System Programmer Response: Determine the cause of the STORAGE OBTAIN failure.

CBR3643I Unable to establish an ESTAE recovery environment for the volume not in library installation exit. ESTAE RC=*return-code***.**

Explanation: An attempt was made, prior to giving control to the volume not in library installation exit (CBRUXVNL), to establish an ESTAE recovery environment to capture any abnormal termination that may occur in the installation exit. The attempt to establish an ESTAE recovery environment failed. The return code from the ESTAE macro is listed in the text of the message as *return-code*.

Source: Object Access Method (OAM)

System Action: The volume not in library installation exit is not invoked due to the failure to establish an ESTAE recovery environment. OAM proceeds as if the installation exit was invoked and returned with a return code of zero, indicating that normal error processing should be performed for the condition causing the volume not in library installation exit to receive control.

System Programmer Response: Determine the cause of the ESTAE failure. Return codes from the MVS ESTAE macro are documented in *OS/390 MVS Programming: Assembler Services Reference*.

CBR3645E Volume not in library installation exit (CBRUXVNL) disabled due to an installation exit failure.

Explanation: During the processing of the volume not in library installation exit (CBRUXVNL), the installation exit has either:

- Returned with an invalid return code
- Abnormally ended.

A prior message has identified the specific cause of failure.

Source: Object Access Method (OAM)

System Action: The volume not in library installation exit (CBRUXVNL) is deactivated until either OAM has been stopped and restarted, or the installation exit has been reactivated by issuing the LIBRARY RESET, CBRUXVNL command.

System Programmer Response: Determine the cause of the volume not in library installation exit (CBRUXVNL) failure. LINKEDIT a new copy of the volume not in library installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3646D Entry of CBRUXVNL volume *volser* into library *library-name* still pending. Reply 'R' to retry or 'C' to cancel.

Explanation: The volume not in library installation exit (CBRUXVNL) has returned control indicating that the operator has placed volume *volser* into library *library-name*, however from a host perspective, the volume has not yet completed cartridge entry processing. At the point in time in which this message has been issued, we will have repeatedly checked (in 30 second time intervals for approximately 15 minutes), for the completion of entry processing by the creation or update of the tape configuration data base (TCDB) volume record indicating that the volume is now library resident. Any library could have satisfied the request; otherwise, the volume should have been entered into the specified target library. This message may have occurred for any one of the following reasons:

- Locating and entering the volume took longer than expected.
- The volume was incorrectly entered into the wrong library.
- The volume is still in the library manager insert category and has not yet been processed by the host.
- The volume went through, but failed entry processing in which case the volume may still be in the insert category or it may have been ejected.

Source: Object Access Method (OAM)

System Action: If the operator replies 'R', repeated attempts are again made to check for entry of the volume. If the volume is successfully entered, job processing continues. If volume is not successfully entered within the allotted time period, this message is again issued.

If the operator replies 'C', the job is cancelled.

Operator Response: If the entry problem cannot be corrected, reply 'C'; otherwise, when the problem has been corrected, reply 'R' to continue the retry attempt.

CBR3650I Eject of volume *volser* from library *library-name* failed.

Explanation: Volume *volser* could not be ejected from library *library-name*. This message is issued in conjunction with message CBRxxxxI explaining the cause of the eject failure.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

Operator Response: Do not retry the eject request until the problem has been resolved.

System Programmer Response: Refer to the message that is issued in conjunction with this message for the cause of the eject failure.

CBR3651I Unable to obtain storage for the installation exit (CBRUXEJC) parameter list.

Explanation: The request to exit failed because storage for the cartridge eject installation exit (CBRUXEJC) parameter list could not be obtained. Refer to preceding message CBR36xxI for the volume serial number and library name, the type of call being made to the exit and the state of the volume.

Source: Object Access Method (OAM)

System Action: The volume remains in the library.

Operator Response: Refer to preceding message CBR36xxI for the specific action to be taken.

System Programmer Response: Determine the cause of the storage shortage.

CBR3652I Unable to establish an ESTAE for the installation exit (CBRUXEJC). ESTAE RC = *return-code***.**

Explanation: The request to the exit failed because OAM was unable to establish a recovery environment for the cartridge eject installation exit (CBRUXEJC). Refer to preceding message CBR36xxI for the volume serial number and the library name, and type of call being made to the exit and state of the volume.

Source: Object Access Method (OAM)

System Action: The volume remains in the library.

Operator Response: Refer to preceding message CBR36xxI for the specific action to be taken.

System Programmer Response: Determine the cause of the ESTAE failure. MVS ESTAE return codes are documented in *OS/390 MVS Programming: Assembler Services Reference*.

CBR3653I Invalid data *data* **returned from the installation exit (CBRUXEJC) in field** *field-name***.**

Explanation: The request to exit failed because invalid return code *return-code* was returned from the cartridge eject installation exit (CBRUXEJC). Refer to preceding message CBR36xxI for the volume serial number and library name associated with the call to the exit.

Source: Object Access Method (OAM)

System Action: The volume remains in the library. Cartridge eject processing involving this exit is discontinued until OAM has been stopped and restarted, or the LIBRARY RESET command has been issued to re-enable the cartridge cartridge eject installation exit (CBRUXEJC).

System Programmer Response: Determine the cause of the cartridge eject installation exit (CBRUXEJC) failure. LINKEDIT a new copy of the installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3654I Invalid return code *return-code* **from the cartridge eject installation exit (CBRUXEJC).**

Explanation: The request to the exit failed because an invalid return code *return-code* was returned from the cartridge eject installation exit (CBRUXEJC). Refer to preceding message CBR36xxI for the volume serial number and library name associated with the eject request.

Source: Object Access Method (OAM)

System Action: The volume remains in the library. Cartridge eject processing involving this exit is discontinued until OAM has been stopped and restarted, or the LIBRARY RESET command has been issued to re-enable the cartridge eject installation exit (CBRUXEJC).

System Programmer Response: Determine the cause of the cartridge eject installation exit (CBRUXEJC) failure. LINKEDIT a new copy of the installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3655E Tape eject processing discontinued due to an installation exit (CBRUXEJC) failure.

Explanation: During physical or logic eject processing, the cartridge eject installation exit (CBRUXEJC) either

- returned invalid data
- returned an invalid return code or
- abnormally ended.

A prior message has identified the specific cause of failure.

Source: Object Access Method (OAM)

System Action: OAM processing continues; however, cartridge eject processing of both physical and logical volumes is discontinued until OAM has been stopped and restarted, or the LIBRARY RESET command has been issued to re-enable the cartridge eject installation exit (CBRUXEJC).

System Programmer Response: Determine the cause of the cartridge eject installation exit (CBRUXEJC) failure. LINKEDIT a new copy of the installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3656I Eject request rejected by the cartridge eject installation exit (CBRUXEJC).

Explanation: The cartridge eject installation exit (CBRUXEJC) did not allow the cartridge to be ejected from the library. Refer to preceding message CBR3650I for the volume serial number and library name associated with the eject request.

Source: Object Access Method (OAM)

System Action: The volume remains in the library.

CBR3657I Abend *ABEND-code* **occurred in the cartridge eject installation exit (CBRUXEJC).**

Explanation: The request to exit failed due to the cartridge eject installation exit (CBRUXEJC) abending. Refer to preceding message CBR36xxI for the volume serial number and library name and type of call being made to the exit and sate of the volume.

Source: Object Access Method (OAM)

System Action: A dump is written to a SYS1.DUMP data set to aid the installation in debugging the problem. Cartridge eject processing of both physical and logic volumes is discontinued until OAM has been stopped and restarted, or the LIBRARY RESET command has been issued to re-enable the cartridge eject installation exit (CBRUXEJC).

System Programmer Response: Determine the cause of the cartridge eject installation exit (CBRUXEJC) failure. LINKEDIT a new copy of the installation exit and either restart OAM or issue the LIBRARY RESET command.

CBR3660A Enter {MEDIA1|MEDIA2|MEDIA3|MEDIA4} scratch volumes into library *library-name***.**

Explanation: The number of usable scratch volumes of the specified media type in library *library-name* has fallen below the media type scratch volume threshold. The media type scratch volume threshold is set by the storage administrator using the ISMF library application.

Source: Object Access Method (OAM)

System Action: Processing continues. This message remains until the number of scratch volumes of the specified media type exceeds twice the media type scratch volume threshold.

System Programmer Response: Determine if volumes with a scratch use attribute are in an error state. If there are, these volumes

are not usable until their error conditions are cleared; this may be the cause of the threshold message.

Operator Response: Enter scratch volumes of the specified media type into the library.

CBR3680I Export completion processing for logical volume *volser* **from library** *library-name* **failed.**

Explanation: Even though logical volume *volser* has been successfully exported to a stacked volume in library *library-name*, the host was unable to complete the export process. This message is issued in conjunction with message CBRxxxxI explaining the cause of the failure.

Source: Object Access Method (OAM)

System Action: The volume remains in the library in the exported category and in the tape configuration database (TCDB) as being library resident.

System Programmer Response: Refer to the message that is issued in conjunction with this message for the cause of the export completion processing failure.

CBR3681I Export completion processing for logical volume *volser* **from library** *library-name* **failed. Unable to set the volume to the volume purge category.**

Explanation: Even though logical volume *volser* has been successfully exported to a stacked volume, the host was unable to complete the export process. The volume could not be set to the volume purge category at the library manager. See the secondary error message for a description of the failure.

Source: Object Access Method (OAM)

System Action: The logical volume remains in the library in the exported category and in the tape configuration database (TCDB) as being library resident. Export completion processing in this library is suspended until OAM has been stopped and restarted, or the LIBRARY RESET, CBRUXEJC command has been issued to resume cartridge export processing.

System Programmer Response: Refer to the secondary error message.

CBR3682I Export completion processing for library *library-name* **failed.**
Unable to obtain the exported category inventory.

Explanation: Even though logical volumes have been successfully exported to a stacked volume, the host was unable to obtain the exported category inventory to complete the export process for library *library-name*. See the secondary error message for a description of the failure.

Source: Object Access Method (OAM)

System Action: The logical volumes remain in the library in the exported category and in the tape configuration database (TCDB) as being library resident. Export completion processing in this library is suspended until OAM has been stopped and restarted, or the LIBRARY RESET, CBRUXEJC command has been issued to resume cartridge export processing.

System Programmer Response: Refer to the secondary error message.

CBR3683I Export completion processing for library *library-name* **suspended.**

Explanation: During export completion processing for library *library-name*, an error occurred causing processing to be suspended. A prior message identifies the specific cause of failure.

Source: Object Access Method (OAM)

System Action: The logical volumes remain in the library in the exported category and in the tape configuration database (TCDB) as being library resident. Export completion processing in this library is suspended until OAM has been stopped and restarted, or the LIBRARY RESET, CBRUXEJC command has been issued to resume cartridge export processing.

System Programmer Response: Refer to the prior message for the cause of the failure.

CBR3684I Export processing completed for logical volume *volser* **from library** *library-name***; however, the TCDB volume record change could not be made.**

Explanation: During export completion processing for volume *volser* from library *library-name*, all of the processing steps completed successfully except for the call to the tape configuration database (TCDB) to either update the volume record to shelf resident or to delete the volume record. Refer to message CBR7031I for the failing CBRXVOL service return code.

Source: Object Access Method (OAM)

System Action: The logical volume has been successfully exported from the library (no longer remains in the library manager export category) and the tape management system, through the cartridge eject installation exit (CBRUXEJC) has been successfully notified of the volume's exported status; however, the volume record in the TCDB still indicates that the volume is library resident. Export completion processing in this library is suspended until until OAM has been stopped and restarted, or the LIBRARY RESET, CBRUXEJC command has been issued to resume cartridge export processing.

System Programmer Response: Refer to message CBR7031I for the specific cause of the TCDB failure. The volume record in the TCDB can be updated (to shelf resident) or deleted using IDCAMS.

CBR3685I Export processing.

Volumes exported from library *library-name*
on stacked volume *volser***.**
volser1 volser2 ... volser8

Explanation: One or more logical volumes have been exported from library *library-name* on stacked volume *volser*.

System Action: The volume record for each volume in the Tape Configuration Database (TCDB) is updated to reflect the export operation. Either the volume record is updated to indicate that the volume is shelf-resident, or the volume record is deleted from the TCDB. The action taken depends on the volume record disposition specified by the cartridge eject installation exit (CBRUXEJC) or the eject default volume record disposition defined for the library through ISMF.

Source: Object Access Method (OAM)

CBR3687I Export completion processing for logical volume *volser* from library *library-name* ignored by the cartridge eject installation exit (CBRUXEJC).

Explanation: The logical volume *volser* has been successfully exported to a stacked volume in library *library-name*; however, the cartridge eject installation exit (CBRUXEJC) indicated that this volume should be ignored and not processed by this host.

Source: Object Access Method (OAM)

System Action: The logical volume remains in the library in the exported category and in the Tape Configuration Database (TCDB) as being library resident until processed by a host. Processing continues with the next exported logical volume residing on the current export stacked volume if one exists. No further exporting of logical volumes to more stacked volumes occurs until all exported logical volumes on the current export stacked volume have export completion processing performed, completing this current export stacked volume.

CBR3688I Unable to perform export completion processing for logical volume *volser* from library *library-name1*. Possible duplicate volume in library *library-name2*.

Explanation: Even though logical volume *volser* has been successfully exported to a stacked volume in library *library-name1*, the host was unable to complete the export process. The host detected that a possible duplicate volume resides in library *library-name2*.

Source: Object Access Method (OAM)

System Action: The logical volume remains in the library in the exported category to be processed by another host.

System Programmer Response: If the volume remains in the exported category after having been processed by all hosts, determine why the volume record in the TCDB does not indicate that the volume resides in the library in which the volume was exported. Once the problem has been resolved, the library name in the volume record can be corrected by using IDCAMS. Once the volume record has been corrected, the LIBRARY RESET, CBRUXEJC command can be used to reprocess the volumes left in the exported category.

**CBR3696I All scheduled audit requests to library *library-name* purged.
OAM termination in progress.**

Explanation: All scheduled audit requests to library *library-name* have been purged. OAM is in the process of terminating.

Source: Object Access Method (OAM)

System Action: OAM termination continues.

CBR3700I Eject canceled for volume *volser*. Library *library-name* is unavailable.

Explanation: Either an operator or the ISMF storage administrator has requested the ejection of tape volume *volser* from tape library *library-name*. The request has been canceled because the library has been varied offline, is pending offline, or is not operational. All pending eject requests for this library are canceled.

Source: Object Access Method (OAM)

System Action: The tape volume is not ejected from the library.

Operator Response: Retry the eject when the library has been varied online and is operational.

System Programmer Response: Retry the eject when the library has been varied online and is operational.

CBR3701I Audit canceled for volume *volser*. Library *library-name* is unavailable.

Explanation: The ISMF storage administrator has requested an audit of tape volume *volser* in tape library *library-name*. The request has been canceled because the library has been varied offline, is pending offline, or is not operational. All pending audit requests for this library are canceled.

Source: Object Access Method (OAM)

System Action: The tape volume is not audited.

System Programmer Response: Retry the audit when the library has been varied online and is operational.

CBR3710I LIBSERV failure occurred for library *library-name*. RC=*return-code*, RSN=*reason-code*.

Explanation: The asynchronous operations manager (AOM) LIBSERV service failed with return code *return-code* and reason code *reason-code* during processing in library *library-name*. The return and reason codes are included for diagnostic purposes and can be found in the *DFSMS/MVS DFSMSdfp Diagnosis Reference* under 'AOM Tape Library Return and Reason Codes'. If the library name is not available at the time of the error, the library ID is displayed instead.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: Determine the cause of the LIBSERV failure. Contact your IBM service representative and report the error message with its return and reason codes. Resubmit the library request when the error is corrected.

CBR3711I Unexpected error code *error-code* and modifier *modifier* from library *library-name*.

Explanation: An error has been detected during processing in tape library *library-name*. The library returned a unit check with an error code *error-code* and modifier *modifier*, which is an unexpected or inappropriate response to the library request. The error code and modifier is included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: Contact an IBM service representative and report the error code and modifier noted in the message. Save the logrec data, if available. Resubmit the library request when the error is corrected.

CBR3712I Unexpected completion code, CC=*cc*, from library *library-name*.

Explanation: An error has been detected during processing in tape library *library-name*. An unexpected or inappropriate delayed response completion code *cc* has been received from the library. The completion code is included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: Contact an IBM service representative and report the completion code noted in the message. Resubmit the library request when the error is corrected.

CBR3713I Permanent I/O error in library *library-name*, for volume *volser*. Sense not available.

Explanation: An error has been detected during processing of volume *volser* in library *library-name*, which returned a permanent I/O error. Library sense information is not available. One of the following situations exists:

- The error was not a unit check.
- The error was a unit check, but the sense record could not be read.
- The sense record did not describe a library related error.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: Contact your IBM service representative to report the permanent I/O error. Resubmit the library request when the error is corrected.

CBR3714I {MOUNT | DEMOUNT | AUDIT | EJECT} for volume *volser*, library *library-name* message ID *msgid* lost.

Explanation: A mount, demount, audit, or eject request was issued for volume *volser* in library *library-name* ; however, completion status for the request was never received by the host. Either the request finished and completion was lost, or the requested action never took place. The request was tracked using library message ID *msgid* but the library manager no longer has information regarding the request for the message ID specified.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

Resubmit the request.

CBR3715I Request for library *library-name* failed. No paths available for I/O.

Explanation: A request was issued to library *library-name* which requires I/O. The request may be an audit, eject, vary, or display, import or export. There are no paths available from the host system to the library, so the request could not be completed.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

Operator Response: Use the MVS operator DEVSERV command to display the status of all channel paths to all tape drives contained within the tape library. For the host system to communicate with the tape library, at least one channel path to one of the tape drives contained within the tape library must be online and operational to the host system that is attempting to perform the I/O request. If all channel paths to all tape drives within the library are offline, use the MVS operator VARY PATH command to vary a path to one of the tape drives contained within the tape library online. Resubmit the failing job when at least one path to one of the tape drives contained within the tape library is online.

CBR3716I Volume *volser* is in the exported category in library *library-name*.

Explanation: During processing in library *library-name*, the library has returned a unit check in response to the library order with an error code in the library sense information indicating that the volume is in the exported category in the library awaiting export completion processing at the host.

Source: Object Access Method (OAM)

System Action: Any order to the library that attempts to use the volume is rejected with a unit check. Since the failure is timing related and no corrective action is needed, the volume error status field in the tape volume record is not updated. As part of export completion processing at the host, the volume record in the tape configuration database (TCDB) will automatically be updated or deleted to reflect that the volume is no longer library resident.

CBR3720I Eject of volume *volser* from library *library-name* canceled.

Explanation: A request was made to eject volume *volser* from library *library-name*; however, after the eject request was scheduled, a request was made to either mount the volume or change the use attribute of the volume. Both of these actions will result in the previously scheduled eject request being canceled. The use attribute of the volume could have been changed through the CBRXLCS FUNC(CUA) interface or through the ISMF Mountable Tape Volume Application volume ALTER capability.

Source: Object Access Method (OAM)

System Action: The volume remains in the library.

Operator Response: Resubmit the eject request after the job completes.

CBR3721I Library *library-name* in manual mode.

Explanation: Library *library-name* signaled that it is in manual mode and incapable of completing an audit request. This condition may be reported by:

- A unit check with an error code in the library sense information.
- The completion code in the delayed response message which signaled completion.

Source: Object Access Method (OAM)

System Action: Audit requests fail while the library is operating in manual mode. Other library requests continue to execute.

System Programmer Response: Resubmit audit requests when the library is no longer in manual mode.

CBR3722I Library *library-name* equipment check.

Explanation: During processing in library *library-name* one of the following situations has occurred:

- The library has returned a unit check in response to the library order with an error code in the library sense information indicating that a library attachment facility equipment check has occurred.
- A hardware failure is indicated by the completion code in the delayed response message which signaled completion.

The failing library component must be repaired before this library request can be completed successfully.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

Operator Response: Vary the library online.

System Programmer Response: If varying the library online fails, contact your IBM service representative to repair the failing library component. Resubmit the library request when the library is online and operational. See any hardware messages, describing the error, issued to the operator console.

CBR3723I Library *library-name* vision system not operational.

Explanation: During the processing of an audit or eject request in library *library-name*, the automated tape library dataserver has signaled that the vision system is not operational. The external label on the cartridge cannot be read, and the library request requires vision system reading of the volser in order to complete normally. The vision system failure may be reported by:

- A unit check where the automated tape library dataserver returned with an error code in the library sense information.
- The completion code in the delayed response message has indicated a failure in the vision system.

Source: Object Access Method (OAM)

System Action: Mount requests are completed with a warning; audit and eject requests fail; demount requests are not affected. OAM processing continues.

System Programmer Response: Contact an IBM service representative to repair the library vision system. Resubmit audit or eject requests when the vision system is operational.

CBR3724I Volume *volser* does not exist in library *library-name*.

Explanation: Volume *volser* does not reside in library *library-name*. The library indicates that the volume does not exist in the library manager inventory by:

- The tape library dataserver returned with a unit check in response to the library order with an error code in the library sense information.
- Returning a completion code in the delayed response message signaling completion.

Source: Object Access Method (OAM)

System Action: Any order to the library that attempts to use the volume is rejected with a unit check. The volume error status field for tape volume *volser* is updated to indicate that the volume is missing.

System Programmer Response: Use the ISMF mountable tape volume list to examine the current state of the volume. IDCAMS may be used to update or delete the volume record in the TCDB.

CBR3725I Library *library-name* command reject for volume *volser*. Library error code=*error-code*.

Explanation: A request for library services for volume *volser* has received a command reject from library *library-name*. The error code *error-code* indicates the nature of the failure. The error code is included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: Save the system log and the logrec data if available. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR3726I Function incompatible error code *error-code* from library *library-name* for volume *volser*.

Explanation: An error has occurred during processing of volume *volser* in library *library-name*. The library returned a unit check with an error code *error-code* which indicates that an incompatible function has been requested. A command has been issued that requests an operation that is understood by the subsystem microcode, but cannot be performed due to one of the following errors:

Value	Description
X'00'	The function requested is not supported by the subsystem to which the order was issued.
X'01'	Library attachment facility not installed and allowed.
X'02'	Not currently used.
X'03'	High capacity input/output facility is not configured.
X'04'	Reserved.
X'05'	Volume requested to be mounted is not compatible with the device allocated.
X'06'	Logical volume can only be ejected if it is in the insert category or is assigned to a category that has the fast-ready attribute set.
X'07'	There is not pending import or export operation to cancel.
X'08'	There are not enough (four) physical drives available to initiate the import or export operation.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: If appropriate, for the type of error encountered, contact your IBM service representative and report the error code noted in the message. Save the system log and the logrec data, if available. Resubmit the library request when the error is corrected.

CBR3727I Control Unit and Library Manager incompatible in library *library-name*, error code *error-code*.

Explanation: An error has been detected during processing in library *library-name*. The library returned with a unit check and error code which indicates that the control unit and the library manager are incompatible. The error code *error-code* indicates the nature of the incompatibility. The error code is included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: Contact an IBM service representative to arrange for the appropriate microcode level to be installed in the control unit and/or the library manager. Resubmit the library request when the microcode levels are compatible.

CBR3728I Volume *volser* in use in library *library-name*. {Already mounted|Mount pending|Eject in progress|Eject pending|Export in progress}.

Explanation: An error has been detected during processing for volume *volser* in library *library-name*. The library returned a unit check with an error code which indicates that the volume is already in use in the library. One of the following situations is present:

- The volume is already mounted on another drive.
- A mount request for the volume is pending.

- The volume is currently being ejected from the library.
- An eject request is pending.
- A volume is being exported.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: Resubmit the library request when the volume is available.

CBR3729I Library Manager for library *library-name* **offline.**

Explanation: Library *library-name* returned a unit check in response to a library request, indicating that the library manager is offline to the subsystem.

Source: Object Access Method (OAM)

System Action: The library request fails. OAM processing continues.

System Programmer Response: Determine why the library manager has been varied offline. The library manager may be varied online from the library manager operator console only. When the library manager is online, vary the library online using the VARY SMS command.

CBR3750I Message from library *library-name***:** *message***.**

Explanation: Message has been sent from library *library-name*. Either the operator, at the library manager console has entered a message that is to be broadcast to the host, or the library itself, has broadcast a message to the host to relay status information or report an error condition.

Source: Object Access Method (OAM)

System Action: None.

CBR3751I Device *device-number* **in library** *library-name* **is unavailable.**

Explanation: The specified device in the indicated library is no longer available. Either the operator has changed the state of the device through the library manager console, or a device failure was detected by the library.

Source: Object access method (OAM)

System Action: OAM varies the device offline for operator reasons to prevent the device from being allocated.

System Programmer Response: If the state of the device has been manually changed through the library manager console, the device can be made available from the library manager console. If the device became unavailable as a result of a device failure, contact the IBM service representative to perform the necessary repair.

CBR3752I Device *device-number* **in library** *library-name* **is now available.**

Explanation: The specified device in the indicated library, which was previously unavailable, is now available. The device has been made available through the library manager console.

Source: Object access method (OAM)

Operator Response: Vary the device online from the host system console to make it available for allocation.

CBR3753E All convenience output stations in library *library-name* **are full.**

Explanation: All storage cells in all convenience output stations in library *library-name* are occupied by ejected cartridges. No more cartridges can be ejected to a convenience output station until some of the already-ejected cartridges have been removed.

Source: Object Access Method (OAM)

System Action: Requests to eject cartridges from the library using a convenience output station are accepted and queued for eventual action by the library manager. This message is retained until one or more convenience output stations may again be used for cartridge ejection.

Operator Response: Remove the ejected cartridges from one or more of the convenience output stations.

CBR3754E High capacity output station in library *library-name* **is full.**

Explanation: All storage cells in the high capacity output station in library *library-name* are occupied by ejected cartridges. No more cartridges can be ejected to the high capacity output station until some of the already-ejected cartridges have been removed.

Source: Object Access Method (OAM)

System Action: Requests to eject cartridges from the library using the high capacity output station are accepted and queued for eventual action by the library manager. This message is retained until the high capacity output station may again be used for cartridge ejection.

Operator Response: Remove the ejected cartridges from the high capacity output station.

CBR3755E {Input|Output} door open in library *library-name***.**

Explanation: One of the following situations has been detected in library *library-name*:

- An input station door has been open for more than 300 seconds.
- An eject operation cannot be completed because an output station door is open.

Source: Object Access Method (OAM)

System Action: Cartridges cannot be entered into the library while the input station door is open. Cartridges cannot be ejected from the library while the output station door is open. This message is retained until the open door has been closed.

Operator Response: Close the input or output station door.

CBR3756I Library *library-name* **has returned to the automated operational state.**

Explanation: Library *library-name* has transitioned from the paused or manual operational state back to the automated state. All mechanical motion within the library is now fully automated.

Source: Object access method (OAM)

CBR3757E Library *library-name* **in {paused|manual mode} operational state.**

Explanation: Library *library-name* is no longer running in the automated (normal) operational state. The operational state is one of the following:

paused All mechanical motion within the library has stopped. Paused operational state is entered automatically when a failure within the library prevents further automated operation, or explicitly by command from the library manager

operator console. The library manager continues to accept orders from the host but queues them for execution after the paused operational state has changed to automated or manual mode operational state.

manual mode All mechanical motion within the library has stopped. Manual mode operational state is entered explicitly by command from the library manager operator console. The library manager continues to accept orders from the host, then provides explicit instructions to the operator to perform manually the functions which would normally be done automatically, such as volume fetch and mounting.

Source: Object access method (OAM)

System Action: Usage of the library continues in nearly normal fashion. There may be an impact on performance, since library operations are either queued for later execution or executed manually. This message is retained until the library has returned to the automated operational state.

Operator Response: Determine why the library is no longer in automated operational state. If repair action is required, contact an IBM service representative.

CBR3758E Library *library-name* **operation degraded.**

Explanation: One or more components of library *library-name* have failed or otherwise become unavailable for use. The library is continuing to function, but performance may be degraded.

Source: Object Access Method (OAM)

System Action: Usage of the library continues in nearly normal fashion, though performance may be degraded. This message is retained until all library facilities have become fully operational.

Operator Response: Use the library manager console display facility to determine which library component is malfunctioning; then contact an IBM service representative to perform the necessary repair action.

CBR3759E Library *library-name* **safety enclosure interlock open.**

Explanation: One of the interlocks on the safety enclosure of library *library-name* is open. The library has entered the paused operational state until the interlock is again closed.

Source: Object Access Method (OAM)

System Action: The library manager continues to accept orders from the host but queues them for execution after the library has left the paused operational state. This message is retained until all the safety interlocks have been closed.

Operator Response: Ensure that the safety interlocks are closed.

CBR3760E Library *library-name* **vision system not operational.**

Explanation: All components of the vision system of library *library-name* have failed. The library is unable to read the external labels on cartridges.

Source: Object Access Method (OAM)

System Action: The library manager continues to accept mount and demount orders from the host but executes them without external label verification. Eject and audit orders are rejected as long as the vision system remains not operational. This message is retained until at least one component of the library vision system has been restored to correct operation.

Operator Response: Contact an IBM service representative to perform the necessary repair action.

CBR3761E Library *library-name* **library manager offline.**

Explanation: The library manager component of library *library-name* has started the process of going offline as the result of an explicit command from the library manager operator console.

Source: Object Access Method (OAM)

System Action: All orders which have already been accepted by the library manager are completed normally. All new orders are rejected with a unit check. OAM marks the library not operational. This message is retained until the library manager again comes online, and the library is varied online using the VARY SMS command.

Operator Response: Determine why the library manager has been placed in the offline state. If repair action is required, contact an IBM service representative.

CBR3762E Library *library-name* **intervention required.**

Explanation: A condition in library *library-name* requires operator intervention to resolve. The required action is specified on the library manager operator console.

Source: Object Access Method (OAM)

System Action: The library manager continues to accept orders from the host. Some orders may be queued for execution after the intervention required condition has been cleared. This message is retained until all intervention required conditions have been cleared.

Operator Response: Take the action specified on the library manager operator console.

CBR3763E Library *library-name* **library manager check 1 condition.**

Explanation: A severe error condition has been detected by the library manager in library *library-name*. The error cannot be recovered without disrupting the current state of the library.

Source: Object Access Method (OAM)

System Action: All orders which have already been accepted by the library manager are lost. All new orders are rejected with a unit check. OAM marks the library not operational. This message is retained until the library manager has left the check 1 state and is ready to receive new orders from the host, and the library is varied online using the VARY SMS command.

Operator Response: Contact an IBM service representative to perform the necessary repair action.

CBR3764E Library *library-name* **all storage cells full.**

Explanation: All storage cells in library *library-name* are occupied by, or reserved for, cartridges that are already in the library.

Source: Object Access Method (OAM)

System Action: No more cartridges may be entered into the library until some of the existing cartridges have been ejected. This message is retained until cartridges have been ejected from the library.

Operator Response: Eject cartridges from the library.

CBR3765E No cleaner volumes available in library *library-name*.

Explanation: The library manager in library *library-name* needs to perform a clean operation on one of the drives in the library, but there are no cleaner volumes available.

Source: Object Access Method (OAM)

System Action: The clean operation is not performed. This message is retained until cleaner volumes have been made available to the library.

Operator Response: Enter cleaner volumes into the library.

CBR3766E Dual write disabled in library *library-name*.

Explanation: The library manager in library *library-name* is not updating the secondary database for the library manager inventory. This may be the result of a hardware failure, or of a command entered at the library manager console.

Source: Object Access Method (OAM)

System Action: Only the primary library manager database is updated. This message is retained until the dual write facility has again been enabled in the library.

Operator Response: If a hardware failure has occurred, contact an IBM service representative. If dual write has been disabled by operator command, determine the reason, then re-enable the facility from the library manager console when advisable.

CBR3767E Library *library-name* environmental alert.

Explanation: Smoke has been detected in the library enclosure for library *library-name*.

Source: Object Access Method (OAM)

System Action: Power is removed from the robotics in the library, the library enters the paused operational state, and intervention required is signaled. All orders sent to the library are queued for processing after the condition has been cleared.

Operator Response: Contact an IBM service representative to determine the source of the smoke and repair the problem. The environmental alert state must be cleared by operator action at the library manager console before the library can resume normal automated operation.

CBR3769I Misplaced volume *volser* found in library *library-name*.

Explanation: Volume *volser*, which had previously been reported as misplaced, has been found in library *library-name*. The library manager inventory has been updated to reflect the new location of the volume.

Source: Object Access Method (OAM)

System Action: The volume is now available for use. The volume error status field for volume *volser* in the tape configuration database (TDCB) is updated to clear the misplaced volume indication.

CBR3770I Volume *volser* misplaced in library *library-name*.

Explanation: Volume *volser* in library *library-name* is missing. The library has indicated that the volume cannot be found at the location recorded in the library manager inventory.

Source: Object Access Method (OAM)

System Action: Any order to the library that attempts to use the volume is rejected with a unit check. The volume error status field for volume *volser* in the tape configuration database (TDCB) is updated to indicate the volume is missing.

Operator Response: If the volume has been manually removed from the library, for an automated tape library dataserver, reenter it into the library through one of the input stations. For a manual tape library dataserver, reenter the volume into the library at the library manager console.

System Programmer Response: Use the ISMF mountable tape volume list to examine the current state of the volume. IDCAMS may be used to update or delete the volume record in the TDCB.

CBR3771I Duplicate volume *volser* ejected from library *library-name*.

Explanation: Volume *volser* was found in an unexpected location in library *library-name*. The location recorded in the library manager inventory already contains a volume with the same volser; this volume has been ejected from the library to a convenience output station.

Source: Object Access Method (OAM)

System Action: Requests for the volume use the one that occupies the location recorded in the library manager inventory.

Operator Response: Remove the ejected volume from the output station.

CBR3772I Duplicate volume *volser* left in input station in library *library-name*.

Explanation: An attempt has been made to enter volume *volser* into library *library-name*. The volser is already recorded in the library manager inventory, and the location assigned in the inventory contains a volume with the volser; the entered volume has been left in the input station.

Source: Object Access Method (OAM)

System Action: Requests for the volume use the one that occupies the location recorded in the library manager inventory.

Operator Response: Remove the volume from the input station.

CBR3773I Cartridge with an unreadable or invalid external label left in an I/O station in library *library-name*.

Explanation: An attempt has been made to enter a cartridge into library *library-name*. One of the following situations exists:

- The external label on the cartridge is missing, or unreadable or contains an invalid character.
- The media type cannot be determined from reading the media type label.
- The media type cannot be determined from using a library manager selected default media type.

The cartridge has been left in an I/O station.

Source: Object Access Method (OAM)

System Action: The cartridge cannot be used in the library.

Operator Response: Remove the cartridge from the library and replace either the external volser label or the media type label and reenter the volume into the library.

CBR3774I Unexpected volume *volser* ejected from library *library-name*.

Explanation: Volume *volser* was found in an unexpected location in library *library-name*. Either there is no entry for the volser in the library manager inventory, or the cartridge external label is missing or unreadable. The cartridge has been ejected from the library to a convenience output station. When the external label is missing or unreadable, *volser* is set to '??????'.

Source: Object Access Method (OAM)

System Action: The cartridge cannot be used in the library.

Operator Response: Remove the ejected cartridge from the output station; replace the cartridge external label, if necessary; then enter the cartridge into the library.

CBR3776I Volume *volser* inaccessible in library *library-name*.

Explanation: Library *library-name* has indicated that volume *volser* is inaccessible. The volume cannot be retrieved using normal library automated function; manual intervention is needed.

Source: Object Access Method (OAM)

System Action: Any order to the library that attempts to use the volume is rejected with a unit check. The volume error status field for volume *volser* in the tape configuration database (TDCB) is updated to reflect the error.

Operator Response: Place the library in the paused operational state. Retrieve the inaccessible volume, if possible, and reenter it into the library through an input station. You may prefer to contact an IBM service representative to assist you.

Application Programmer Response: Resubmit the failing job once the volume is again accessible.

CBR3777I Volume *volser* now accessible in library *library-name*.

Explanation: Volume *volser*, which had previously been reported as inaccessible, has been retrieved and is now accessible for operations in library *library-name*. The library manager inventory has been updated to reflect the new volume status.

Source: Object Access Method (OAM)

System Action: The volume is now available for use. The volume error status field for volume *volser* in the tape configuration database (TDCB) is updated to clear the inaccessible volume indication.

CBR3778I Cleaner volume ejected from library *library-name*.

Explanation: A cleaner volume has exceeded its maximum usage count and has been ejected from library *library-name*.

Source: Object Access Method (OAM)

System Action: The cartridge can no longer be used in the library.

Operator Response: Remove the cartridge from the output station.

CBR3779I Damaged volume *volser* ejected from library *library-name*.

Explanation: Damaged volume *volser* has been ejected from library *library-name*. The cartridge has been physically damaged such that it cannot be loaded; the leader block is missing, or the tape medium has become detached from the leader block, or the tape medium is incompatible with the drive.

Source: Object Access Method (OAM)

System Action: The damaged cartridge is ejected from the library. OAM updates the tape volume record in the tape configuration database to show that the volume resides outside the library.

System Programmer Response: Determine and correct the cause of the problem before reentering the volume back into the library. If the volume was mounted on an incompatible device, check the media type of the volume in the tape configuration database to determine if it is correct and if it isn't, first use IDCAMS to correct or delete the volume record in the tape configuration database and then determine why the library manager was reporting the wrong media type to the host. Once both of these items have been corrected, the volume can be reentered into the library. If it is a leader block problem, the volume must be repaired or replaced before the volume can be used.

Operator Response: Contact the system programmer.

CBR3781I No {MEDIA1|MEDIA2|MEDIA3|MEDIA4} scratch volumes available in library *library-name*.

Explanation: There are no usable scratch volumes of the specified media type in library *library-name*.

Source: Object Access Method (OAM)

System Action: Any order to the library that attempts to mount a scratch volume of the specified media type is rejected with a unit check.

Operator Response: Enter scratch cartridges of the specified media type into the library.

CBR3782I Volume *volser* in library *library-name* external label missing or unreadable.

Explanation: The external cartridge label for volume *volser* in library *library-name* is missing or cannot be correctly read by the library vision system.

Source: Object Access Method (OAM)

System Action: The library cannot perform volume verification. Mount, demount, and eject orders that specify the volume are completed with an attention message. The volume error status field for volume *volser* in the tape configuration database (TDCB) is updated to reflect the error.

System Programmer Response: Use the ISMF mountable tape volume list to examine volume status. When convenient, eject the volume from the library and apply a new cartridge external label.

CBR3783E Library manager switchover in library *library-name* in progress.

Explanation: Library *library-name* is switching between the primary and secondary library manager. The switchover may be the result of a library manager detected unrecoverable error, or an operator request initiated through the library manager.

Source: Object Access Method (OAM)

System Action: During the switchover, all queued operations and responses are lost at the library, and the library is in an offline state until the switchover completes. All new requests are rejected with a unit check. This message is retained until the switchover has completed.

Operator Response: If an unrecoverable error has occurred, contact an IBM service representative.

System Programmer Response: When message CBR3784I has been issued, indicating that the switchover is complete, any outstanding mount requests (CBR4196D) can be responded to and any new requests to the library can be submitted

CBR3784I Library manager switchover in library *library-name* is now complete.

Explanation: The library manager switchover in library *library-name* has completed.

Source: Object Access Method (OAM)

System Programmer Response: Any outstanding mount requests (CBR4196D) can be responded to and any new requests to the library can be submitted.

CBR3801I Volume *volser* audited in library *library-name*.

Explanation: Volume *volser* in library *library-name* has been successfully audited, however, an error was detected during the audit. Another message should be issued explaining the error found. This message is issued to the TSO user ID of the storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: The audit request succeeds. OAM processing continues.

System Programmer Response: Refer to any previous messages issued to the storage administrator's TSO user ID, describing unusual conditions detected for the library or volume. Use the ISMF mountable tape volume list to examine volume status.

CBR3805I Audit failed for volume *volser* in library *library-name*.

Explanation: An unexpected library or volume condition has been encountered during an audit for volume *volser* in library *library-name*. This message is issued to the TSO user ID of the storage administrator who initiated the audit request.

Source: Object Access Method (OAM)

System Action: The audit request fails. OAM processing continues.

System Programmer Response: Refer to any previous messages issued to the storage administrator's TSO user ID, describing unusual conditions detected for the library or volume. Resubmit the audit request when the condition is no longer present.

CBR3806I Update of the volume error status in the TCDB for volume *volser* failed. Return=*return-code*.

Explanation: During processing for volume *volser*, the error status field in the volume record in the tape configuration database (TCDB) could not be updated. The return code received is *return-code*. See the preceding IDC3009I message for an explanation of the integrated catalog facility (ICF) failure. The return code is for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

System Programmer Response: Determine the cause of the ICF catalog failure.

CBR3850I Library order sequence check in library *library-name*. An export or import operation already in progress.

Explanation: One export operation is allowed to run at a time per virtual tape server subsystem (logical library), however only one import operation is allowed to run per physical library. Also, import and export operations to the same virtual tape server subsystem (logical library) are mutually exclusive.

System Action: The export or import request fails.

Operator Response: Resubmit the export or import request after the request has completed.

CBR3851I The import operation for import list volume *volser* failed. The number of logical volumes defined for library *library-name* is at the maximum.

Explanation: An import operation was requested using volume *volser* but the number of logical volumes defined to the library inventory is at the maximum limit for library *library-name*; therefore, the scheduling of the import operation failed.

Source: Object access method (OAM)

System Action: The command fails.

System Programmer Response: Export volumes from library *library-name* to allow the import operation to execute or consider another library for the import operation.

Operator Response: Reissue the import operation once the full library condition has been resolved or reissue the request using an import list volume residing in another library.

CBR3852I Library order sequence check in library *library-name*. A previous export or import operation did not complete host processing.

Explanation: An import or export operation was requested for library *library-name*; however, a previous import or export operation left volumes unprocessed by the host. For an import operation, the unprocessed volumes are in the insert category, waiting for a host to complete the importing of these volumes. For an export operation, the unprocessed volumes are in the exported category, waiting for a host to complete the export completion processing of these volumes. Subsequent import or export operations will fail in library *library-name* until a host processes the residual unprocessed volumes.

Source: Object access method (OAM)

System Action: The command fails.

System Programmer Response: To determine which volumes have not been processed for library *library-name*, check the status file from the last import or export operation to determine which volumes were not processed and/or list the volumes in the insert category for a previous incomplete import operation or in the exported category for a previous incomplete export operation.

To complete the previous export operation, the host must have the volume records in the TCDB. Issue LIBRARY RESET, CBRUXEJC to initiate export completion processing at the host.

To complete the previous import operation, the host and its tape management system must be able to process the residual import volumes, not ignore them. Issue LIBRARY RESET, CBRUXENT to initiate import/entry processing at the host.

Operator Response: Reissue the import or export operation after the host processing cleanup has been completed for the previous operation.

CBR3853I The import operation for import list volume *volser* failed.
There are no stacked volumes in the import category for library *library-name*.

Explanation: The import operation for import list volume *volser* failed because the library *library-name* does not contain any stacked volumes in the import category. The stacked volumes needed from import processing should be entered into the library prior to initiating the import operation.

Source: Object Access Method (OAM)

System Action: The import request fails.

System Programmer Response: Resubmit the request to initiate the import operation once the stacked volumes needed for the import operation have been entered into the library.

CBR3854I The operation for list volume *volser* failed. Scratch volumes are needed in library *library-name* for stacking.

Explanation: The operation for list volume *volser* failed because library *library-name* does not have enough scratch volumes available for stacking the logical volumes. Scratch volumes should be entered into the library.

Source: Object Access Method (OAM)

System Action: The request fails.

System Programmer Response: Resubmit the request to initiate the export or import operation once the scratch volumes have been entered into the library.

CBR3855I Export operation for logical list volume *volser* in library *library-name* completed successfully. Requested: *requested-number* Exportable: *exportable-number* Exported: *exported-number* Stacked volumes: *stacked-number* MBytes Exported: *MBytes-exported* MBytes Moved: *MBytes-moved*

Explanation: The export operation using volume *volser* in library *library-name* completed successfully without exceptions. The statistics reported in this message indicate the following:

Requested *requested-number* is the total number of logical volumes found in the export list dataset.

Exportable *exportable-number* is the number of logical volumes that are valid candidates for export. This number is derived from scanning the export list dataset and validating which volumes reside in this library.

Exported *exported-number* is the number of logical volumes successfully exported from this library for this export operation.

Stacked volumes *stacked-number* is the number of stacked volumes used to export the logical volumes.

MBytes Exported *MBytes-exported* is the amount of data exported during this operation. Only the logical volumes that were successfully exported are included in this count. The amount reported is an integral multiple of 1,048,576 bytes (1 MBytes). Logical volumes exported that contain less than 1 MBytes are rounded up to 1 MBytes before being added to the count.

MBytes Moved *Mbytes-moved* is the amount of data that was moved from one stacked volume to another as part of the export process. The amount reported is an integral multiple of 1,048,576 bytes (1 MBytes). Logical volumes exported that contain less than 1 MBytes are rounded up to 1 MBytes before being added to the count.

System Programmer Response: For a history of the export operation, the export list volume status file (file sequence 3) can be read. This file is updated by the library to indicate the success or failure of each logical volume in the list; this operation completed successfully; therefore, all volumes listed in the status file for this library, should indicate that they were successfully exported. Refer to message CBR3685I for a list of the logical volumes that were successfully exported.

Operator Response: If not already released, the stacked volumes used in the export process can be released at the library manager.

CBR3856I Export operation for logical list volume *volser* in library *library-name* completed with exceptions or errors. Requested: *requested-number* Exportable: *exportable-number* Exported: *exported-number* Stacked volumes: *stacked-number* MBytes Exported: *MBytes-exported* MBytes Moved: *MBytes-moved*

Explanation: The export operation using volume *volser* in library *library-name* completed with exceptions or errors. The statistics reported in this message indicate the following:

Requested *requested-number* is the total number of logical volumes found in the export list dataset. However, if the export list dataset contains a record with either an invalid logical volume or invalid syntax, it is not included in the count.

Exportable *exportable-number* is the number of logical volumes that are valid candidates for export. This number is derived from scanning the export list dataset and validating which volumes reside in this library and are not in-use, misplaced, or inaccessible.

Exported *exported-number* is the number of logical volumes successfully exported from this library for this export operation.

Stacked volumes *stacked-number* is the number of stacked volumes used to export the logical volumes.

MBytes Exported *MBytes-exported* is the amount of data exported during this operation. Only the logical volumes that were successfully exported are included in this count. The amount reported is an integral multiple of 1,048,576 bytes (1 MBytes). Logical volumes exported that contain less than 1 MBytes are rounded up to 1 MBytes before being added to the count.

MBytes Moved *Mbytes-moved* is the amount of data that was moved from one stacked volume to another as part of the export process. The amount reported is an integral multiple of 1,048,576 bytes (1 MBytes). Logical volumes exported that contain less than 1 MBytes are rounded up to 1 MBytes before being added to the count.

If the export operation did not complete due to being cancelled or because of an error which caused the operation to end abruptly, another CBRxxxxI message accompanies this message with an explanation of what occurred.

Check the status file on the logical list volume *volser* for the disposition of the logical volumes that were not successfully exported to determine the error incurred.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

System Programmer Response: For a history of the export operation, the export list volume status file (file sequence 3) can be read. This file is updated by the library to indicate the success or failure of each logical volume in the list. Refer to message CBR3685I for a list of the logical volumes that were successfully exported. If the export completed with exceptions or was cancelled, the export operation can be restarted after the problems have been resolved.

Operator Response: If not already released, any stacked volumes completed in the export process can be released at the library manager.

CBR3857I Export operation for logical list volume *volser* **in library** *library-name* **completed with exceptions or errors. Statistics for the operation were not available.**

Explanation: The export operation using volume *volser* in library *library-name* completed with exceptions or errors. No statistics were available for the operation.

Another CBRxxxxI message accompanies this message with an explanation of the error incurred.

Depending on the type of error incurred, the status file on the logical list volume *volser* may have been updated to indicate the disposition of the logical volumes if the operation had made progress processing the logical volumes.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

System Programmer Response: Depending on the type of error incurred, the export list volume status file (file sequence 3) may have been updated by the library to indicate the success or failure of each logical volume in the list that was processed. Refer to message CBR3685I for a list of the logical volumes that were successfully exported, if any. The export operation can be restarted after the problems have been resolved.

Operator Response: If not already released, any stacked volumes completed in the export process can be released at the library manager.

CBR3858I Error incurred with list volume *volser* **in library** *library***. Library returned failure:** *failure-reason***.**

Explanation: The export or import operation could not proceed due to a failure with logical list volume *volser* residing in library *library*. Refer to the Magstar 3494 Tape Library Operator Guide for a more detailed explanation of the failure *failure-reason*.

Source: Object Access Method (OAM)

System Action: The export or import request fails.

System Programmer Response: Resubmit the request once the problem with the failed logical list volume has been corrected or resubmit the request using a different volume as the logical list volume.

CBR3860I Import operation for logical list volume *volser* **in library** *library-name* **completed successfully. Requested:** *requested-number* **Importable:** *importable-number* **Imported:** *imported-number* **Stacked volumes:** *stacked-number* **MBytes Imported:** *Mbytes-imported* **MBytes Moved:** *Mbytes-moved*

Explanation: The import operation using volume *volser* in library *library-name* completed successfully without exceptions. The statistics reported in this message indicate the following:

Requested *requested-number* is the total number of stacked volumes found in the import list dataset.

Importable *importable-number* is the number of logical volumes found or requested in this library to import. This count includes the logical volumes explicitly listed in the import list dataset and the logical volumes contained on a stacked if only the stacked volume is specified.

Imported *imported-number* is the number of logical volumes successfully imported into this library.

Stacked volumes *stacked-number* is the number of stacked volumes processed in this import operation. For a volume to be included in this count, it must have been specified in the import list dataset and reside in the library.

MBytes Imported *MBytes-imported* is the amount of data imported during this operation. Only the logical volumes that were successfully imported are included in this count. The amount reported is an integral multiple of 1,048,576 bytes (1 MBytes). Logical volumes imported that contain less than 1 MBytes are rounded up to 1 MBytes before being added to the count.

MBytes Moved *Mbytes-moved* is the amount of data that was moved from one stacked volume to another as part of the import process. The amount reported is an integral multiple of 1,048,576 bytes (1 MBytes). Logical volumes imported that contain less than 1 MBytes are rounded up to 1 MBytes before being added to the count.

System Programmer Response: The status file on the import list volume (file sequence 2) indicates the disposition of each logical volume being imported. Since this operation completed without exception, all the logical volumes in the list for this library would have successful status. Refer to message CBR3610I for the list of volumes that were successfully imported/entered into the library.

Operator Response: If not already released, the stacked volumes used in the import process can be released at the library manager.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

CBR3861I Import operation for logical list volume *volser* **in library** *library-name* **completed with exceptions or errors. Requested:** *requested-number* **Importable:** *importable-number* **Imported:** *imported-number* **Stacked volumes:** *stacked-number* **MBytes Imported:** *MBytes-imported* **MBytes Moved:** *MBytes-moved*

Explanation: The import operation using volume *volser* in library *library-name* completed with exceptions or errors. The statistics reported in this message indicate the following:

Requested *requested-number* is the total number of stacked volumes found in the import list dataset. However, if the import list dataset contains a record that either has an invalid physical or logical volser or invalid syntax, it is not included in the count.

Importable *importable-number* is the number of logical volumes found or requested in this library to import. This count includes the logical volumes explicitly listed in the import list dataset and the logical volumes contained on a stacked if only the stacked volume is specified.

Imported *imported-number* is the number of logical volumes successfully imported into this library.

Stacked volumes *stacked-number* is the number of stacked volumes processed in this import operation. For a volume to be included in this count, it must have been specified in the import list dataset and reside in the library.

MBytes Imported *MBytes-imported* is the amount of data imported during this operation. Only the logical volumes that were successfully imported are included in this count. The amount reported is an integral multiple of 1,048,576 bytes (1 MBytes). Logical volumes imported that contain less than 1 MBytes are rounded up to 1 MBytes before being added to the count.

MBytes Moved *Mbytes-moved* is the amount of data that was moved from one stacked stacked volume to another as part of the import process. The amount reported is an integral multiple of 1,048,576 bytes (1 MBytes). Logical volumes imported that contain less than 1 MBytes are rounded up to 1 MBytes before being added to the count.

If the import operation did not complete due to being cancelled or because of an error which caused the operation to end abruptly, another CBRxxxxI message accompanies this message with an explanation of what occurred.

Check the status file on the logical list volume *volser* for the disposition of the logical volumes that were not successfully imported to determine the error incurred.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

System Programmer Response: For a history of the import operation, the import list volume status file (file sequence 2) can be read. This file is updated by the library to indicate the success or failure of each logical volume in the list. Refer to message CBR3610I for a list of the logical volumes that were successfully imported/entered into the library, if any. If complete the import operation, restart the import operation after the problems have been resolved.

Operator Response: If not already released, the stacked volumes used in the import process can be released at the library manager.

CBR3862I Import operation for logical list volume *volser* **in library** *library-name* **completed with exceptions or errors. Statistics for the operation were not available.**

Explanation: The import operation using volume *volser* in library *library-name* completed with exceptions or errors. No statistics were available for the import operation.

Another CBRxxxxI message accompanies this message with an an explanation of the error incurred.

Depending upon the type of error incurred, the status file on the logical list volume *volser* may have been updated to indicate the disposition of the logical volumes if the operation had made progress processing the logical volumes.

Source: Object Access Method (OAM)

System Action: OAM processing continues.

System Programmer Response: For a history of the import operation, the import list volume status file (file sequence 2) can be read. Depending on the type of error incurred, this file may have been updated by the library to indicate the success or failure of each logical volume in the list. Refer to message CBR3610I for a list of the logical volumes that were successfully imported/entered into the library, if any. The import operation can be restarted after the problems have been resolved.

Operator Response: If not already released, the stacked volumes used in the import process can be released at the library manager.

CBR3863I {Export|Import} operation cancelled for logical list volume *volser* **in library** *library-name***.**

Explanation: The {export|import} operation using logical list volume *volser* residing in library *library-name* was cancelled by:

- The LIBRARY {Export|Import},*volser*,CANCEL command.
- The LCS external services general use programming interface.
- The operator at the library manager.
- The library itself.

Source: Object Access Method (OAM)

System Action: The export or import operation is cancelled.

System Programmer Response: Another CBRxxxxI message is issued in conjunction with this message with or without statistics indicating the progress that the operation made, if any. Also, the logical list volume status file can be read to determine the progress of the operation. Resubmit the operation when the library is available to proceed with the import or export operation.

CBR3865I Library initiated single volume import for volume *volser* **in library** *library-name* **completed successfully.**

Explanation: The library initiated import for logical volume *volser* in library *library-name* completed successfully.

Source: Object Access Method (OAM)

System Action: The import operation at the library has completed and the the tape configuration database (TCDB) reflects that the volume is library resident.

System Programmer Response: Message CBR3610I should also have been issued indicating that the volume was imported/entered into the library.

CBR3866I Library initiated single volume import for logical volume *volser* **in library** *library-name* **failed. Library returned failure:** *failure-reason***.**

Explanation: A library initiated import for logical volume *volser* in library *library-name* failed. Refer to the Magstar 3494 Tape Library Operator Guide for a more detailed explanation of the failure *failure-reason*.

Source: Object Access Method (OAM)

System Action: The import operation failed.

System Programmer Response: Resubmit the request after the problem has been resolved.

CBR3899I Protocol error of *psc* **received from device controller trying to access library** *library-name***.**

Explanation: The device controller has determined that the communications packet, CBRPAC, is in error. The specific error may be referenced below by using the protocol status code (psc) value:

```
1 - packet ID is incorrect
2 - length of packet out of range
3 - command type not recognized
4 - SCSI bus ID out of range
5 - logical unit number out of range
6 - length of data out of range
7 - library number out of range
8 - protocol error status
9 - checksum error
```

Source: Object access method (OAM)

System Action: Depending upon the operation that was issued to library *library-name*, OAM may continue.

Operator Response: Notify the system programmer.

System Programmer Response: Use the *psc*, above, to determine the reason for the error. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR3900A Close the input/output station door on library *library-name*.

Explanation: The cartridge in the gripper is ready to be placed in the I/O station of library *library-name*, but the door is open.

Source: Object access method (OAM)

System Action: OAM continues processing.

Operator Response: Close the I/O station door.

CBR3901I Storage unavailable for MDR record for library *library-name*. MDR record lost.

Explanation: The library control task tried to get storage for the 3995 MDR record for library *library-name* but failed to obtain it. The buffered MDR was not written to the logrec data set. The message is preceded by message CBR7004I which contains the return code from the STORAGE macro.

Source: Object access method (OAM)

System Action: None.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure by referring to documentation for CBR7004I.

CBR3902I Storage unavailable for OBR record for library *library-name*. Library initialization terminated.

Explanation: The library control task attempted to get storage for the OBR record for library *library-name* but failed to obtain it. This message is preceded by message CBR7004I which contains the return code from the STORAGE macro.

Source: Object access method (OAM)

System Action: Library initialization is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure by referring to documentation for CBR7004I.

CBR3903I Storage unavailable for DB2 OKD Parameter list for library *library-name*. Library initialization terminated.

Explanation: The library control task attempted to get storage for the DB2 OKD parameter list for library *library-name* but failed to obtain it. This message is preceded by message CBR7004I which contains the return code from the STORAGE macro.

Source: Object access method (OAM)

System Action: Library initialization is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure by referring to documentation for CBR7004I.

CBR3904I Storage unavailable for library LQRY status area for library *library-name*. Library initialization terminated.

Explanation: The library control task attempted to get storage for the library query (LQRY) status area for library *library-name* but failed to obtain it. This message is preceded by message CBR7004I which contains the return code from the STORAGE macro.

Source: Object access method (OAM)

System Action: Library initialization is stopped.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure by referring to documentation for CBR7004I.

CBR3905I Storage unavailable for library command packet for library *library-name*. The command was not executed.

Explanation: The library driver task attempted to get storage for the library command packet for library *library-name* but failed to obtain it. This message is preceded by message CBR7004I which contains the return code from the STORAGE macro.

Source: Object access method (OAM)

System Action: The command was not carried out.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure by referring to documentation for CBR7004I.

CBR3910I There is no online and operational optical disk library.

Explanation: If this OAM is not in an OAMPLEX, one of the following occurred:

- During OAM initialization, it was detected that there are no optical disk libraries that are online and operational on any OAM in the OAMPLEX.
- The last optical disk library was varied offline to this instance of OAM and it was detected that there are no optical disk libraries that are online and operational on any OAM in the OAMPLEX.
- The last optical disk library that was operational on this OAM was marked not operational and it was an instance that OAM was marked not operational and it was detected that there are no optical disk libraries that are online and operational on any OAM in the OAMPLEX.

Source: Object access method (OAM)

System Action: No optical disk library requests will be honored until a library is online and operational.

Operator Response: If a library is offline but operational, issue the VARY SMS command to vary the library online. If a library is not operational and online, issue the VARY SMS command to vary the library offline and then online. If a library is nonoperational and offline, issue the VARY SMS command to vary the library online. If the operational status does not change by varying the library on and offline, contact hardware support.

CBR3911I There is no online and operational tape library.

Explanation: During OAM initialization, none of the tape libraries have come up online and operational, or the last tape library has been varied offline, or the last tape library has been marked not operational.

Source: Object Access Method (OAM)

System Action: No tape library requests are honored until a library is online and operational.

Operator Response: Issue the SMS VARY command to bring the library online and operational. If the library does not come online, contact an IBM service representative.

CBR3912I There is no online and operational optical disk library. on this OAM member *member-name***.**

Explanation: This OAM is a member, *member-name*, of an OAMPLEX and one of the following has occurred:

- During OAM initialization, no optical disk libraries came up online and operational to this instance of OAM.
- the last optical disk library was varied offline to this instance of OAM.
- the last optical disk library that was operational on this instance of OAM. was marked not operational.

There may still be optical libraries online and operational to other instances of OAM in the OAMPLEX.

Source: Object access method (OAM)

System Action: No optical disk library requests will be honored until a library is online and operational.

Operator Response: If a library is offline but operational, issue the VARY SMS command to vary the library online. If a library is not operational and online, issue the VARY SMS command to vary the library offline and then online. If a library is nonoperational and offline, issue the VARY SMS command to vary the library online. If the operational status does not change by varying the library on and offline, contact hardware support.

CBR3951I Remap request cancelled. Library *library-name* **is not available.**

Explanation: Remap request cancelled for library *library-name* because a library component is not available. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: OAM continues processing.

System Programmer Response: Resubmit remap when library is both online and operational.

CBR3952I Remap request cancelled for library *library-name***. The OAM address space is terminating.**

Explanation: An operator command requesting stopping of OAM was issued, or an error occurred causing the OAM address space to be terminated. Because of this, the remap for library *library-name* is no longer scheduled for implementation. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: Remap request is not performed. OAM proceeds with stopping.

System Programmer Response: Resubmit remap for library *library-name* when OAM is available.

CBR3953I Invalid media type detected for volume *volser* **by remap for library** *library-name***.**

Explanation: When performing remap for library *library-name*, the media type for volume *volser* was examined to determine what pseudo library name should be assigned. The media type was invalid. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: The volume table row for this volume is updated with a media type and pseudo library that is compatible with library *library-name*. The volume is marked as lost and shelf-resident. The volume record for this volume's other side is updated to match volume *volser*.

System Programmer Response: Verify that the updates described above are correct for this cartridge.

CBR3956I Remap of library *library-name* **updating volume** *volser* **location.**

Explanation: During remap, volume *volser* was found in the library *library-name*, but had a library location of shelf (S). This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: Volume *volser* location is changed to library (L).

CBR3957I Remap of library *library-name* **updating volume** *volser* **library name and location.**

Explanation: During remap, volume *volser* was found in the library *library-name*; however, volume location indicated it was shelf-resident. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: The library name in the volume row for volume *volser* is updated to the name of library *library-name* and the location is changed to reflect that the volume is library resident.

CBR3958I Volume *volser* **not found in volume table by remap of library** *library-name***. Eject scheduled.**

Explanation: During remap of library *library-name*, volume *volser* was found in the controller map but could not be found in the volume table. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: The cartridge is scheduled for eject.

System Programmer Response: In order for volume *volser* to be library resident in library *library-name*, re-enter cartridge.

CBR3959I Library *library-name* volume *volser* opposite side mismatch. Eject scheduled.

Explanation: During remap of library *library-name*, the opposite side of volume *volser* in the controller map (outboard inventory) did not match the opposite side in the volume table. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: The cartridge is scheduled for eject.

System Programmer Response: Examine the two cartridges involved in detection of mismatched cartridge sides (this cartridge and the cartridge with the volume that the DB2 record for volume *volser* indicates is the opposite side). Check the external labels of these two cartridges to determine which cartridge belongs in this library.

CBR3960I Volumes *volser-1* and *volser-2* not found in volume table by remap of *library-name*. Eject scheduled.

Explanation: During remap of library *library-name*, both volume serial numbers (*volser-1* and *volser-2*) for cartridge were found in the controller map (outboard inventory) but were not found in OAM's optical configuration data base. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: The cartridge is scheduled for eject.

System Programmer Response: Enter this cartridge in the library where these volumes should reside.

CBR3961I Volume *volser* not found in controller map by remap of library *library-name*.

Explanation: During remap of library *library-name*, volume *volser* was found in the volume table but was not found in the controller map (outboard inventory). This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: The volume record is updated to reflect that volume *volser* is lost, shelf-resident and in a pseudo library. This volume's opposite side is also updated with the same information.

System Programmer Response: Take inventory of shelf volumes to locate missing volume.

CBR3962I Remap for library *library-name* started.

Explanation: Remap for library *library-name* begins processing. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: Library *library-name* will be unavailable until remap is complete.

CBR3963I Remap for library *library-name* completed.

Explanation: Remap for library *library-name* has completed. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: Library *library-name* is now available.

Operator Response: The drives must be varied online before the library can be used.

System Programmer Response: To view results of remap, consult the volume error status field displayed on the ISMF mountable optical volume list panel.

CBR3964I Remap of library *library-name* failed. Unable to eject cartridge.

Explanation: During remap of library *library-name*, an attempt to eject a cartridge from the library failed. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: Remap processing stops. The controller has updated its volume inventory map as a result of this remap request.

Operator Response: Check preceding messages issued to operator console to determine action required to rectify problem.

System Programmer Response: Remap request for library *library-name* should be resubmitted following resolution of problem causing eject failure.

CBR3966I Remap of library *library-name-1* found wrong library *library-name-2* for volume *volser*. Eject scheduled.

Explanation: During remap verification of the controller map (outboard inventory), volume *volser* was found in library *library-name-1* but the volume table indicates the volume is in library *library-name-2*. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: Cartridge is scheduled for eject.

System Programmer Response: Audit volume *volser* to verify if it actually resides in library *library-name-2*. If it does, the volume being ejected from library *library-name-1* is a duplicate volume. If the audit of volume *volser* does not find the volume in library *library-name-2*, request a remap of library *library-name-2* in order to locate the missing volume.

CBR3967I Unable to retrieve empty slot count from controller during remap of library *library-name*.

Explanation: After the remap verification was complete for library *library-name*, a request was made to the controller to obtain the number of empty slots. This request failed and the DB2 library table was not updated. Updating the empty slot count is the last step in remap processing and its failure does not present a severe impact. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: The next time OAM is initialized, the empty slot count will be updated. OAM processing continues.

Operator Response: Check previous messages issued to operator console indicating hardware error which may have caused problem with retrieving information from this library's controller.

System Programmer Response: Contact your service representative. Following resolution of any hardware problems involving this library, consider this library's remap processing complete and proceed as normal.

CBR3968I Remap for library *library-name* failed. The controller could not successfully complete remap.

Explanation: Remap for library *library-name* has stopped due to a problem which occurred when the remap command was sent to the controller or during remap processing by the controller. This can occur when there is a hardware problem with a library component, or if a cartridge removal request from the IO station was not completed within the designated time frame. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: OAM processing continues.

Operator Response: Contact your system programmer. If a hardware error occurred, a message explaining the error should have been sent to the operator's console.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR3969I Remap for library *library-name* failed. Unable to retrieve map from controller.

Explanation: Remap processing in the controller for library *library-name* was successful but the request to obtain a copy of the new volume inventory map failed. Verification of the new volume inventory map from the controller and the host volume table has not occurred. This error can occur if access to the library fails when attempting to retrieve the new controller map. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: Remap processing stops. The controller has updated its volume inventory map as a result of this remap request.

Operator Response: Contact service representative. Check for hardware errors reported in messages issued to the operator console.

System Programmer Response: Remap request for library *library-name* should be resubmitted following resolution of hardware problems involving this library. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR3970I Remap of library *library-name* detected an error identifying a volume. Eject scheduled.

Explanation: During remap verification of library *library-name*, the controller detected an error when attempting to identify a cartridge. This cartridge cannot be used in the library. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: The cartridge is scheduled to be ejected from the library.

System Programmer Response: Examine the ejected cartridge to determine if the cartridge is damaged. If the cartridge does not appear to be damaged, enter the cartridge in the library I/O station to obtain diagnostic information to determine if the cartridge is unformatted, incorrect media for this library, or a duplicate cartridge.

CBR3971I Remap request cancelled for library *library-name*. Unable to establish recovery environment.

Explanation: Processing of remap for library *library-name* was unsuccessful because of an internal problem with establishing the ESTAE environment for the remap program. This can occur if the ESTAE program is unable to acquire storage to establish the error recovery environment. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: OAM processing continues.

System Programmer Response: If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR3973I Remap of library *library-name* update of volume table for *volser* failed. Return=*return-code*, Reason=*reason-code*.

Explanation: An error occurred updating a volume table row for volume *volser* in the DB2 optical configuration database with the results from remap processing for library *library-name*. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library.

Source: Object access method (OAM)

System Action: Remap processing continues.

Operator Response: See previous message(s) issued to operator's console for possible message describing DB2 error.

System Programmer Response: Refer to preceding message issued by remap describing error for this volume. Return code *return-code* and reason code *reason-code* reported in this message are for diagnostic purposes only. Obtain the logrec data set error record.

CBR3974I Remap for library *library-name* has terminated due to a failure in obtaining storage.

Explanation: Remap for library *library-name* stopped for failing to acquire storage needed for processing. This error can occur if storage was not obtained when attempting to acquire a copy of the controller inventory map or when attempting to schedule an eject of a cartridge. This message is issued to the TSO/E userid of the ISMF storage administrator who originated the remap request for this library and to the operator console.

Source: Object access method (OAM)

System Action: Remap processing stops for library *library-name*.

Operator Response: Contact your system programmer.

System Programmer Response: Submit remap for library *library-name* following resolution of problem. If the problem recurs and if the program is not in error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Obtain the logrec data set error record.

CBR4000I LACS *function-name error-type* **for drive** *device-number***.**

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing. This message provides a general description of the error.

function-name identifies the LACS function which detected the error:

MOUNT Mount a volume on a library-resident drive.

DEMOUNT Demount a volume from a library-resident drive.

WAIT Wait for the completion of a previous library mount request.

VERIFY Determine whether a previous library mount request completed successfully.

CANCEL Cancel a previous library mount request.

WTO Write a message to the operator concerning a non-library-resident drive.

DOM Delete an operator message that has been written concerning a non-library-resident drive.

ERRTEXT Construct messages that describe an error detected by LACS.

BADFUNC Invalid LACS function code specified by the caller.

error-type identifies the general error category as follows:

warning The requested function executed successfully, but a warning condition was detected.

parameter error An erroneous parameter value or combination of values was passed to LACS, or a required parameter value was not supplied.

environmental error The requested function could not be performed in the current processing environment.

permanent error An error condition was detected that prevented further processing for the request.

system service failure A nonzero return code was received from a system service whose correct execution is essential to LACS processing.

abnormal termination An abnormal termination occurred during LACS processing.

device number is the device number of the drive to which the LACS request was directed.

Source: Object Access Method (OAM)

System Action: Disposition of the LACS request has already occurred. In all cases except the warning condition, the request has failed. A second message, containing a precise description of the warning or error, immediately follows this message; messages constructed and issued by the user of LACS may also be issued in conjunction with the LACS messages.

Operator Response: See the description of the LACS message issued immediately after this one.

System Programmer Response: See the description of the LACS message issued immediately after this one.

CBR4001I Library *library-name* **vision system not operational.**

Explanation: During processing for a Library Automation Communication Services (LACS) MOUNT or WAIT request, library *library-name* has signaled that the library vision system is not operational. The external label on the mounted cartridge cannot be read, so the library cannot verify that the correct volume has been mounted. The library returns the volume serial number listed in its inventory as residing in the storage slot from which the cartridge has been selected.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The caller of LACS may choose to:

- Accept the mounted volume
- Retry the mount request by demounting the volume, assigning it to the error category in the library inventory, and calling for the mount of another scratch volume
- Fail the mount request.

Operator Response: Contact an IBM service representative to repair the library vision system.

CBR4002I Volume *volser* **external label missing or unreadable.**

Explanation: During processing for a Library Automation Communication Services (LACS) MOUNT or WAIT request, the library has signaled that the external label on the mounted cartridge is missing or, if present, cannot be read. Thus, the library cannot verify that the correct volume has been mounted. The library returns the volume serial number listed in its inventory as residing in the storage slot from which the cartridge has been selected.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The caller of LACS may choose to:

- Accept the mounted volume
- Retry the mount request by demounting the volume, assigning it to the error category in the library inventory, and calling for the mount of another scratch volume
- Fail the mount request.

System Programmer Response: Use the ISMF mountable tape volume list to examine volume status. When convenient, eject the volume from the library and apply a new cartridge external label.

CBR4003I Volume *volser* **error status not recorded.**

Explanation: As part of a Library Automation Communication Services (LACS) DEMOUNT request, the caller requested that an error status code be assigned to the volume being demounted. The attempt to update the tape configuration database (TDCB) volume record failed, or the attempt to set a scratch volume to the error category at the library failed.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code.

System Programmer Response: Use the ISMF mountable tape volume list to examine volume status. If the problem recurs, eject the volume from the library. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR4004I Volume *volser* not returned to scratch status.

Explanation: As part of a Library Automation Communication Services (LACS) DEMOUNT request, the caller requested that volume *volser* be returned to scratch status. Either the update of the tape configuration database (TDCB) volume record was unsuccessful, or the assignment of the volume to the scratch category in the library inventory failed.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The volume remains assigned to the private category.

System Programmer Response: Use the ISMF mountable tape volume list to examine volume status and assign it to scratch if necessary. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR4005I Scratch mount volser mismatch: int *internal-volser*, ext *external-volser*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) VERIFY processing for a scratch volume mount. The caller-supplied *internal-volser* does not match the *external-volser* returned by the library at the completion of the volume mount. The internal volser is recorded on the tape as part of the volume label; the external volser is recorded on an external label on the tape cartridge.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The caller of LACS may choose to:

- Accept the mounted volume by writing a new volume label with an internal volser that matches the external volser.
- Retry the mount request by demounting the volume, assigning it to the error category in the library inventory, and calling for the mount of another scratch volume.

System Programmer Response: If the mounted volume is not accepted, use the ISMF mountable tape volume list to examine the status of the volume and eject it from the library, if necessary.

CBR4006I Manual mode mount volser mismatch: int *internal-volser*, ext *external-volser*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) VERIFY processing for a specific volume mount that was completed by the library operator because the library is operating in manual mode. The caller-supplied *internal-volser* does not match the *external-volser* returned by the library at the completion of the volume mount. The internal volser is recorded on the tape as part of the volume label; the external volser is recorded on an external label on the tape cartridge. When the library is operating in manual mode, it is an operator reply to a console message that confirms that a particular volume has been mounted; the use of the library vision system is not possible.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The caller of LACS retries the mount request by demounting the volume and calling for the remount of the same volume.

Operator Response: If the error persists, cancel the job.

System Programmer Response: If the mounted volume is not accepted, use the ISMF mountable tape volume list to examine the status of the volume and eject it from the library, if necessary.

CBR4007I Scratch mount invalid. Volume *volser* not defined in TCDB.

Explanation: An error has been detected during Library Automation Communication Services (LACS) VERIFY processing for a scratch volume mount on a tape drive that resides in a manual tape library dataserver. Volume *volser*, which was mounted by the operator, is not defined in the tape configuration database.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The caller of LACS retries the mount request by demounting the mounted volume and reissuing the mount scratch request.

Operator Response: Mount a scratch volume that is defined in the tape configuration database.

CBR4008I Scratch mount failed. Volume *volser* not in library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) VERIFY processing for a scratch volume mount on a tape drive that resides in a manual tape library dataserver. Volume *volser*, which was mounted by the operator, does not reside in library *library-name*.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The caller of LACS retries the mount request by demounting the mounted volume and reissuing the mount scratch request.

Operator Response: Mount a scratch volume that resides in the library.

CBR4009I Scratch mount invalid. Volume *volser* not a scratch volume.

Explanation: An error has been detected during Library Automation Communication Services (LACS) VERIFY processing for a scratch volume mount on a tape drive that resides in a manual tape library dataserver. Volume *volser*, which was mounted by the operator, is not a scratch volume.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The caller of LACS retries the mount request by demounting the mounted volume and reissuing the mount scratch request.

Operator Response: Mount a scratch volume on the tape drive.

CBR4010I MTLDS mount volser mismatch: int *internal-volser*, req *requested-volser*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) VERIFY processing for a specific volume mount on a drive in a manual tape library dataserver. The caller-supplied *internal-volser* does not match the *requested-volser* specified on the original mount request. The internal volser is recorded on the tape as part of the volume label.

Source: Object Access Method (OAM)

System Action: The LACS request completes with a warning return code. The caller of LACS retries the mount request by demounting the incorrectly mounted volume and again calling for the mount of the original volume.

Operator Response: Mount the correct volume.

CBR4011I Permanent load failure: volume *volser* in library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or WAIT function. An unrecoverable load failure occurred during the attempt to mount the volume.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Determine the cause of the load failure. The possibility also exists that the volume was mounted on an incompatible device. If this is the case, check the media type of the volume in the tape configuration database to determine if it is correct and if it isn't, first use IDCAMS to correct or delete the volume record in the tape configuration database and then determine why the library manager was reporting the wrong media type to the host. Once both of these items have been corrected, the volume can be ejected and reinserted back into the library.

Operator Response: Contact the system programmer.

CBR4012I Damaged scratch volume *volser* ejected from library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or WAIT function. Library *library-name* has indicated that the cartridge for scratch volume *volser* has been physically damaged so that it cannot be loaded; the leader block is missing, or the tape medium has become detached from the leader block, or the tape medium is incompatible with the drive.

Source: Object Access Method (OAM)

System Action: The LACS scratch mount request fails with a warning return code, and the mount is retried with a different scratch volume. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Determine and correct the cause of the problem before reentering the volume back into the library. If the volume was mounted on an incompatible device, check the media type of the volume in the tape configuration database to determine if it is correct and if it isn't, first use IDCAMS to correct or delete the volume record in the tape configuration database and then determine why the library manager was reporting the wrong media type to the host. Once both of these items have been corrected, the volume can be reentered into the library. If it is a leader block problem, the volume must be repaired or replaced before the volume can be used.

Operator Response: Contact the system programmer.

CBR4033I UCB address missing or invalid.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT, DEMOUNT, WAIT, VERIFY, CANCEL, WTO, or DOM function. The address of the unit control block (UCB) for the target drive has not been supplied, or the address does not point to a valid UCB.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4034I Volume serial number missing.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT or VERIFY function. The volume serial number has not been supplied. For a MOUNT request, the volser identifies the volume to be mounted; for VERIFY, it contains the internal volser read from the tape volume label.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4035I LACS token address missing.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT, DEMOUNT, WAIT, VERIFY, CANCEL, WTO, or DOM function. The address of the LACS token has not been supplied. For the MOUNT, DEMOUNT, and WTO functions, LACS places a value that uniquely identifies the request into the token area; for the other functions, the caller passes the token value to LACS.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4036I Message buffer token address missing.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the error message construction (ERRTEXT) function. The address of the message buffer token has not been supplied; the token identifies the area into which LACS is to place the messages once they have been assembled.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4037I WTO parameter list address missing.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT, DEMOUNT, or WTO function. The address of the WTO parameter list has not been supplied. For a MOUNT or DEMOUNT, the WTO parameter list address is required only when the caller also specifies a console ID or a command and response token (CART).

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4038I Both UCB address and UCB/token list address missing.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the CANCEL function. Neither a unit control block (UCB) address nor a UCB/token list address has been supplied; one or the other is required.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4039I More than one synchronization option specified.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT function. More than one synchronization option (post a user-specified event control block (ECB), schedule a user-specified mount failure exit routine, or wait for the mount completion) has been requested.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4040I Multiple category assignments requested.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the DEMOUNT function. Both a volume error status code (which may cause the volume to be assigned to the error category in the library inventory) and the return to scratch option (which causes the volume to be assigned to the scratch category) have been specified. The volume may belong to only one category at a time.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4041I Both UCB address and UCB/token list address specified.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the CANCEL function. Both a unit control block (UCB) address and a UCB/token list address have been supplied; the parameters are mutually exclusive.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4042I Invalid return or reason code specified.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the ERRTEXT (error message construction) function. Either the LACS return code or the LACS reason code is invalid; message construction cannot be performed.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4043I Invalid LACS function code specified.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing. The LACS function code is invalid.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4044I WTO parameter list not in WPX format.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT, DEMOUNT, or WTO function. Either a console ID or a command and response token (CART) has been supplied, but the WTO parameter list is not in the extended (WPX) format.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4045I LACS token value zero.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the WAIT, VERIFY, or CANCEL function for a library-attached drive. The LACS token, which is used to identify the prior LACS MOUNT request, is zero; this is not a valid token value.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4046I Wait incompatible with mount synchronization option.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the WAIT function. The synchronization option specified with the MOUNT function requested the posting of a user event control block (ECB) or the scheduling of a user mount failure exit routine; neither option is compatible with the WAIT function.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4047I LACS return and reason codes show successful completion.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the error message construction (ERRTEXT) function. The LACS return and reason codes show that the operation completed successfully; message construction is not performed for successful operations.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4048I Tape Device Selection Information address missing.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT function. The address of the Tape Device Selection Information parameter has not been supplied during a scratch volume mount. For a scratch volume mount the Tape Device Selection Information address is required.

Source: Object Access Method (OAM)

System Action: The LACS MOUNT request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4049I Media type is invalid.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT function. The media type in the Tape Device Selection Information was invalid during an attempt to process a scratch volume mount.

Source: Object Access Method (OAM)

System Action: The LACS MOUNT request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4050I Internal volume serial number *internal-volser* is invalid.

Explanation: An error has been detected during Library Automation Communication Services (LACS) parameter validation processing for the MOUNT or VERIFY function in a Manual Tape Library Dataserver. The internal volume serial number from the mounted tape volume did not conform to the label requirements for system-managed tape libraries. The volser must consist entirely of numerics (0-9) and upper-case alphabetics (A-Z), with no imbedded blanks.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a parameter error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions documented in the messages issued by the caller.

CBR4066I Token mount request not found.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the WAIT, VERIFY, or CANCEL function for a library-resident tape drive. The mount request represented by the LACS token is not pending execution on the drive, nor is it the most recently completed order on the drive.

Source: Object Access Method (OAM)

System Action: The LACS request fails with an environmental error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4067I Token mount request not complete.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the VERIFY function for a library-attached drive. The mount request represented by the LACS token is still pending execution on the drive. Mount verification cannot be performed until the mount has been completed.

Source: Object Access Method (OAM)

System Action: The LACS request fails with an environmental error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions in the message descriptions for the messages issued by the caller.

CBR4097I Library *library-name* offline.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. Library *library-name* is offline.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: If appropriate, vary the library online using:

```
VARY SMS,LIBRARY(library-name),ONLINE
```

Application Programmer Response: Resubmit the failing job.

CBR4098I Library *library-name* not operational.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. Library *library-name* is not operational as the result of an error detected and reported earlier.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Vary the library online, using:

```
VARY SMS,LIBRARY(library-name),ONLINE
```

If the failure persists, contact an IBM service representative to repair the library.

Application Programmer Response: Resubmit the failing job.

CBR4099I Library *library-name* permanent I/O error. Sense not available.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. Library *library-name* returned a permanent I/O error indication in response to the mount or demount order. Library sense information is not available. One of the following situations exists:

- The error was not a unit check.
- The error was a unit check, but the sense information could not be read.
- The error was a unit check, the sense information could be read, but the sense record did not describe a library related error.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Contact an IBM service representative to repair the library.

Application Programmer Response: Resubmit the failing job.

CBR4100I Library *library-name* equipment check.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. One of the following situations has occurred in library *library-name*:

- The library returned a unit check in response to the mount or demount order. The library sense information indicates that a library path equipment check has occurred.
- The completion code in the attention message that signaled mount or demount completion indicates hardware failure.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Contact an IBM service representative to repair the library.

Application Programmer Response: Resubmit the failing job.

CBR4101I Library *library-name* Control Unit, Library Manager incompatible.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. Library *library-name* returned a unit check in response to the mount or demount order. The library sense information indicates that the control unit and the library manager are incompatible for one of the following reasons:

- The control unit and the library manager microcode levels are not compatible.
- The sequence number of the control unit does not match the value known to the library manager.
- The library manager has received a valid message type from the control unit, but it contains information not recognized by the library manager.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Contact an IBM service representative to arrange for the appropriate microcode level to be installed in the control unit or the library manager, or both.

Application Programmer Response: Resubmit the failing job.

CBR4102I Unexpected or inappropriate response from library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. One of the following situations has occurred:

1. Library *library-name* returned a unit check in response to the mount or demount order. The library sense information contains an error code which meets one of the following criteria:
   - The mount request was for a specific volume, but the error code is appropriate only for a scratch volume.
   - The mount request was for a scratch volume, but the error code is appropriate only for a specific volume.
   - The error code is an unexpected and inappropriate response to the mount or demount order.
   - The error modifier code associated with the error code is an unexpected and inappropriate response to the mount or demount order.
2. Library *library-name* returned a delayed response message to signal completion of the mount order. The delayed response completion code is an unexpected or inappropriate response to the mount order.

Source: Object Access Method (OAM)

System Action: For the unexpected or inappropriate error code, LACS is abnormally terminated with system completion code 0B6; the ABEND reason code identifies the specific error. When execution resumes following the ABEND, the LACS request fails with a permanent error return code. For the unexpected or inappropriate delayed response completion code, the LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Contact the system programmer.

System Programmer Response: Follow the instructions for system completion code 0B6.

CBR4103I Volume *volser* already in use in library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT function. Library *library-name* returned a unit check in response to the mount order. The library sense information indicates that volume *volser* is already in use in the library and cannot be mounted on the requested drive. One of the following situations is present:

- The volume is already mounted on another drive.
- A mount request for the volume is pending.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Notify the submitting programmer when the volume has been demounted.

Application Programmer Response: Resubmit the failing job.

CBR4104I Volume *volser* not in library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or WAIT function. Library *library-name* cannot mount volume *volser* for one of the following reasons:

- The volume no longer resides in the library.
- A physical volume is currently being ejected from the library and the eject request is currently in progress and cannot be cancelled.
- A physical volume has been manually ejected from the library.
- A logical volume is export pending in the library and individual export requests cannot be canceled.
- A logical volume has been exported from the library and is currently in the exported category awaiting completion processing by the host.

For a physical volume, LACS has attempted to invoke the Volume Not in Library Installation Exit (CBRUXVNL) to recover from the error; either the exit was unable to recover, or the exit was previously disabled. The error is most likely the result of ejecting the volume after the job control blocks have been built but before the job has executed.

For a logical volume that is being exported, the mount request is immediately failed.

The error may be reported by a unit check when the mount order is first sent to the library, or by a failure completion code in the attention message that signals mount completion.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Application Programmer Response: Resubmit the failing job.

CBR4105I No {eligible|MEDIA1|MEDIA2|MEDIA3|MEDIA4} scratch volumes available in library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or WAIT function. Library *library-name* has indicated that there are no more eligible scratch volumes in the library, so the mount scratch request cannot be executed. If the job requested a specific media type, the type is included in the message. If the job did not request a specific media type and the device is capable of mounting multiple media types, then there are no scratch volumes of any eligible type and the message text specifies *eligible*. The error may be reported by a unit check when the mount order is first sent to the library, or by a failure completion code in the attention message which signals mount completion.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Enter scratch cartridges into the library.

Application Programmer Response: Resubmit the failing job.

CBR4106I Invalid sequence of orders sent to library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. Library *library-name* returned a unit check in response to the mount or demount order. The library sense information indicates that an invalid sequence of orders has been sent to the library.

For a mount order, one of the following situations is present:

- A mount request is already pending for the drive.
- A volume is currently mounted on the drive, and no demount order is pending.

For a demount order, one of the following situations is present:

- A demount request is already pending for the drive.
- No volume is currently mounted on the drive, and no mount order is pending.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: The preceding message CBR4000I identifies the failing order and provides the device number of the drive on which the volume is mounted. If the failing order is a mount:

1. Use the MVS VARY command to vary the drive offline on the system where the error occurred. This will demount any volume which is still mounted on the drive.
2. Vary the drive back online.

If the failing order is a demount, no action is needed.

Application Programmer Response: Resubmit the failing job.

CBR4107I Volume *volser* not in assigned location in library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or WAIT function. Library *library-name* has indicated that volume *volser* cannot be found at the location recorded in the library manager inventory. The error may be reported by a unit check when the mount order is sent to the library, or by a failure completion code in the attention message that signals mount completion.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Use the ISMF mountable tape volume list to examine the current state of the volume. IDCAMS may be used to update or delete the volume record in the tape configuration database.

CBR4108I Unable to determine external volser of mounted volume.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the VERIFY function. The external volume serial number of the volume that is currently mounted on the requested drive is not recorded in the LACS tables and cannot be retrieved from the library. Without the external volser, mount verification cannot be performed.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: The preceding message CBR4000I provides the device number of the drive on which the volume is mounted. Use the MVS VARY command to vary the drive offline on the system where the error occurred. This will demount the volume which is mounted on the drive. Then vary the drive back online.

CBR4109I Library *library-name* **mounted wrong volume: req** *requested-volser***, mnt** *mounted-volser***.**

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the VERIFY function. Library *library-name* has indicated that the mount order has been completed successfully. However, the external volser of the mounted volume, given by *mounted-volser*, does not match the volser of the requested volume, given by *requested-volser*.

Source: Object Access Method (OAM)

System Action: LACS is abnormally terminated with system completion code 0B6-30. When execution resumes following the ABEND, the LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Contact the system programmer.

System Programmer Response: Follow the instructions for system completion code 0B6.

CBR4110I Specific mount volser mismatch: int *internal-volser***, ext** *external-volser***.**

Explanation: An error has been detected during Library Automation Communication Services (LACS) VERIFY processing for a specific volume mount. The external volser of the mounted volume, given by *external-volser*, does not match the volser contained in the volume label, given by *internal-volser*.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message. The caller may choose to retry the mount request or to fail the requesting job.

System Programmer Response: Use the ISMF mountable tape volume list to examine the status of the rejected volume and eject it from the library, if necessary.

CBR4111I AVR verify volser mismatch: int *internal-volser***, ext** *external-volser***.**

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the VERIFY function requested by automatic volume recognition (AVR). The external volser of the mounted volume, given by *external-volser*, does not match the volser contained in the volume label, given by *internal-volser*.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by AVR are written concurrently with this message. AVR demounts the volume from the drive.

System Programmer Response: Use the ISMF mountable tape volume list to examine the status of the volume and eject it from the library, if necessary.

CBR4112I Library *library-name* **Library Attachment Facility not installed.**

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. Library *library-name* returned a unit check in response to the mount or demount order. The library sense information indicates that an incompatible function has been requested. The tape subsystem microcode supports library commands, but the Library Attachment Facility is not installed on the subsystem.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Contact an IBM service representative to arrange for the repair or installation of the Library Attachment Facility.

Application Programmer Response: Resubmit the failing job.

CBR4113I No libraries defined to AOM.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. The asynchronous operations manager (AOM) has rejected the mount or demount order with an indication that no libraries have been defined to AOM. Synchronization has been lost between the caller of LACS and AOM.

Source: Object Access Method (OAM)

System Action: LACS is abnormally terminated with system completion code 0B6-1C. When execution resumes following the ABEND, the LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Contact the system programmer.

System Programmer Response: Follow the instructions for system completion code 0B6.

CBR4114I Library configuration not set to AOM.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. The asynchronous operations manager (AOM) has rejected the mount or demount order with an indication that the library configuration has not yet been set by MVS allocation. Synchronization has been lost between the caller of LACS and AOM.

Source: Object Access Method (OAM)

System Action: LACS is abnormally terminated with system completion code 0B6-20. When execution resumes following the ABEND, the LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Contact the system programmer.

System Programmer Response: Follow the instructions for system completion code 0B6.

CBR4116I Library *library-name* library manager offline.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or DEMOUNT function. Library *library-name* returned a unit check in response to the mount or demount order. The library sense information indicates that the library manager is offline.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Determine why the library manager has been varied offline. The library manager may be varied online from the library manager operator console only.

Application Programmer Response: Resubmit the failing job when the library manager has been varied online.

CBR4117I Volume *volser* inaccessible in library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT, DEMOUNT, or WAIT function. Library *library-name* has indicated that volume *volser* is inaccessible. The volume cannot be retrieved using normal library automated function; operator or service representative intervention is needed. The error may be reported by a unit check when the mount or demount order is sent to the library, or by a failure completion code in the attention message which signals mount completion.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: Place the library in the paused operational state; retrieve the inaccessible volume, if possible, and reenter it into the library through an input station. If the cartridge is jammed in a drive or cartridge loader, try to clear the jam, but do not remove the cartridge from its current position; use the library manager operator console to indicate that the volume is no longer inaccessible. You may prefer to contact an IBM service representative to assist you.

Application Programmer Response: Resubmit the failing job once the volume is again accessible.

CBR4118I Library *library-name* drive no longer available.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or WAIT function. Library *library-name* accepted the mount order and queued it for later execution. Before the mount could be executed, the requested drive was made unavailable by the library manager for one of the following reasons:

- Repeated errors have occurred while loading or unloading cartridges.
- The library operator made the drive unavailable from the library manager operator console.

Source: Object Access Method (OAM)

System Action: The drive is varied offline on each system where it is currently online. The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: The preceding message CBR4000I provides the device number of the drive. If the drive is failing, contact an IBM service representative to repair the drive. When repairs are complete, make the drive available from the library manager operator console, and vary the drive online on the system or systems where it is to be used.

Application Programmer Response: Resubmit the failing job.

CBR4120I Request for volume *volser* in library *library-name* lost.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT function. A mount request for volume *volser* was sent to library *library-name*, but no response has been received from the library. Either the request completed and the completion message was lost, or the request was lost in the library.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Application Programmer Response: Resubmit the failing job.

CBR4122I Damaged volume *volser* ejected from library *library-name*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT or WAIT function. Library *library-name* has indicated that the cartridge for volume *volser* cannot be loaded; the leader block is missing, or the tape medium has become detached from the leader block, or the tape medium is incompatible with the drive.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Determine and correct the cause of the problem before reentering the volume back into the library. If the volume was mounted on an incompatible device, check the media type of the volume in the tape configuration database to determine if it is correct and if it isn't, first use IDCAMS to correct or delete the volume record in the tape configuration database and then determine why the library manager was reporting the wrong media type to the host. Once both of these items have been corrected, the volume can be reentered into the library. If it is a leader block problem, the volume must be repaired or replaced before the volume can be used.

Operator Response: Contact the system programmer.

CBR4123I Volume *volser* in library *library-name* is incompatible with the drive.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT function. Library *library-name* returned a unit check in response to the mount order. The library sense information indicates that the media type of volume *volser* is incompatible with the drive specified and cannot be mounted. This is an indication that the media type of the volume in the tape configuration database does not match the media type of the volume in the library manager database.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Use the ISMF mountable tape volume list or the DISPLAY SMS,VOLUME command to verify that the media type specified for the volume in the tape configuration database is correct and that it matches the media type specified in the library manager database. IDCAMS may be used to update the volume record in the tape configuration database If the media type in the tape configuration database is correct, but the media type in the library manager database is incorrect, first determine and correct the cause of the discrepancy in the library manager database and then eject and reinsert the volume back into the library. If the problem persists, contact an IBM service representative to determine why the media type is not being reported correctly.

Operator Response: Contact the system programmer.

CBR4124I Library *library-name* drive left in stand-alone mode.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT function. Library *library-name* returned a unit check in response to the mount order. The error code and modifier information in the library sense information indicates that the drive had been left in stand-alone mode at the library.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a permanent error return code. Messages issued by the caller of LACS are written concurrently with this message.

Operator Response: The preceding message CBR4000I provides the device number of the drive. The drive can be taken out of stand-alone mode at the library manager. If the drive cannot be taken out of stand-alone, contact an IBM service representative to repair the drive.

Application Programmer Response: Resubmit the failing job.

CBR4129I ESTAE failure. Return code *return-code*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for any requested function. The attempt to establish an ESTAE exit routine failed with ESTAE return code *return-code*.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a system service failure return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: ESTAE return codes are documented in GC28-1642, *OS/390 MVS Programming: Assembler Services Reference*. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR4130I Message construction failure. Return code *return-code*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the error message construction (ERRTEXT) function. The Object Access Method (OAM) message construction service has failed with return code *return-code*. The return code is included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: LACS is abnormally terminated with system completion code 0B6-14. When execution resumes following the ABEND, the LACS request fails with a system service failure return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: Follow the instructions for system completion code 0B6.

CBR4131I WTO failure. Return code *return-code*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT, DEMOUNT, or WTO function. The attempt to write a message to the operator failed with WTO return code *return-code*.

Source: Object Access Method (OAM)

System Action: The LACS request fails with a system service failure return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: WTO return codes are documented in *OS/390 MVS Programming: Assembler Services Reference*. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR4132I LIBSERV failure. Return code *return-code*, reason code *reason-code*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the MOUNT, DEMOUNT, or VERIFY function. The asynchronous operations manager (AOM) LIBSERV service has failed with return code *return-code* and reason code *reason-code*. The return and reason codes are included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: When the LIBSERV return and reason codes indicate that a parameter error has been detected, LACS is abnormally terminated with system completion code 0B6-04. For the other return and reason codes, there is no abnormal termination. In all cases, the LACS request fails with a system service failure return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: If LACS was abnormally terminated, follow the instructions for system completion code 0B6. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR4133I AOMQUE failure. Return code *return-code*, reason code *reason-code*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the WAIT, VERIFY, or CANCEL function. The asynchronous operations manager (AOM) AOMQUE service has failed with return code *return-code* and reason code *reason-code*. The return and reason codes are included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: When the AOMQUE return and reason codes indicate that an invalid request has been made, LACS is abnormally terminated with system completion code 0B6-08. For the other return and reason codes, there is no abnormal termination. In all cases, the LACS request fails with a system service failure return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: If LACS has been abnormally terminated, follow the instructions for system completion code 0B6. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR4134I IEEMIFSV failure. Return code *return-code*, reason code *reason-code*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the error message construction (ERRTEXT) function. The IEEMIFSV message buffer manager service has failed with return code *return-code* and reason code *reason-code*. The return and reason codes are included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: When the IEEMIFSV return and reason codes indicate that a parameter error has been detected, LACS is abnormally terminated with system completion code 0B6-18. For the other return and reason codes, there are no abnormal terminations. In all cases, the LACS request fails with a system service failure return code. Messages issued by the caller of LACS are written concurrently with this message.

System Programmer Response: If LACS was abnormally terminated, follow the instructions for system completion code 0B6. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR4135I CBRXVOL failure. Return code *return-code*.

Explanation: An error has been detected during Library Automation Communication Services (LACS) processing for the VERIFY function. The attempt to read the tape volume record for the mounted volume from the tape configuration database using the CBRXVOL service failed with return code *return-code*. The return code is included for diagnostic purposes only.

Source: Object Access Method (OAM)

System Action: When the CBRXVOL return code indicates that a parameter error has been detected, LACS is abnormally terminated with system completion code 0B6-0C. For the other return codes, there is no abnormal termination. In all cases, the LACS request fails with a system service failure return code. Messages issued by the caller of LACS are written concurrently with this message. If the failure is the result of a catalog error or exceptional condition, message IDC3009I is written to describe the error.

System Programmer Response: If LACS has been abnormally terminated, follow the instructions for system completion code 0B6. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

CBR4136I CBRXLIB failure. Return code *return-code*.
